Returns of Corporations, for Federal Tax Purposes, Reveal That Finance Yields Greatest Percentage of Any Group Classified by the Government

By AARON HARDY ULM

WHAT CORPORATIONS DO WITH THE BILLIONS THEY HANDLE

Compilations made by the United States Internal Revenue Bureau from income and profit tax returns for the year 1919.

Industrial groups	Total number of returns	Total gross income	Cost of goods	Compensation of officers	Interest paid	Domestic tax
Agriculture and related industries	8,298	$791,457,611	$373,580,196	$17,969,650	$24,323,670	$15,772,209
Mining and quarrying	18,469	4,677,648,366	2,548,019,468	50,069,196	79,457,833	69,218,977

[1] Gross income and total deductions incomplete.

FOLLOWING instructions from Congress, the United States Bureau of Internal Revenue periodically takes all the income tax returns made to the Federal Government and consolidates the figures in them into elaborate studies which supply a species of information never before available.

The last complete one deals chiefly with the income and profits tax returns for the year 1919, with some comparisons with those of the three previous years.

The study, for example, gives the combined figures appearing in all the returns made by corporations. Those figures show the gross income of those corporations as a whole and also for groups of them made on the basis of the kind of activity engaged in. They show what proportion of gross income—that is, of all money taken in the course of business—was paid for the goods handled, how much went to the compensation of officers, how much to taxes and how much in the form of interest on borrowed capital.

Thus we find, for instance, that the 12,332 corporations, which in 1919 dealt with good products, liquors and tobacco, had a gross income of slightly more than fourteen billions of dollars. Yet more than eleven and a quarter billions of the intake, or 80.41 per cent of it, was absorbed by cost of goods. The remaining proportion, or 19.59 per cent, met all other expenditures. Officers drew less than one per cent in the form of salaries. Domestic taxes—that is, city, county, state and all taxes other than Federal, took nearly one per cent. Exhaustion, amortization and depletion absorbed 1.20 per cent. Miscellaneous expenses, including such things as rents and wages, took 12.16 per cent. Their average net income before deducting Federal taxes was 8.11 per cent of all money taken in; after those taxes were paid the net income was 5.64 per cent. It is well to note the close margins, which, of course, are for all the corporations of that class, including those that lost as well as those that made money during the year in question. They are the smallest on the whole shown for any group of corporations, particularly so in the matter of difference—as noted, less than 20 per cent—between what was paid for and received for goods handled.

There is one group which has a singular distinction. *In the blank for "cost of goods" there are no figures. Those corporations are classified as "finance, banking, insurance, and so on," of which a total number of 72,813 made Federal tax returns in 1919. They are the corporations which deal in money or something similar—their "goods" in the main being intrusted to them for safe-keeping or investment and, therefore, costs them nothing in the sense that the goods handled by a grocer are paid for by the grocer.* In another sense, the "goods" handled by the finance group of corporations do cost them something, but that cost is put down under the interest heading. That is, what they pay for their "goods" is distributed mainly in the form of interest, in the same manner that the groceryman who borrows money from the bank to meet a bill for goods pays interest on that money.

The total gross income of the finance group of corporations making returns in 1919 was $6,459,366,141. This did not include all money taken in as in the case of other groups but only all taken in over and above the money of others—or, in other words, gross earnings.

Let's see what became of those funds. We find that the compensation of officers absorbed 4.08 per cent, or slightly more than twice the proportion for the average of all corporations. Domestic taxes took 2.80 per cent; exhaustion, and so on, 1.67; miscellaneous expenses, 67.61, and interest, 12.96.

It is well to bear in mind that "interest" in that case substantially was "cost of goods," being what was returned to those who supplied the funds with which business was carried on. In many cases, of course, those funds were borrowed even from banks as in the case of other businesses, but in the run of cases it is as presumable that they were supplied in the form of deposits or premiums. Thus out of $6,459,366,141 of gross earnings only $837,231,516 went to those who supplied such "goods" as were dealt in. That, of course, was for the use of and not for the purchase of the "goods."

The finance group of corporations in 1919 had an average net income of 10.88 per cent, one of the highest of all groups, before Federal taxes were paid. After all taxes were paid the earnings averaged 9.21 per cent, the highest for any group.

The point illustrated by the figures is that the best earning corporations were those which did not buy and sell goods as a merchant or manufacturer does, but those which dealt in intangibles, chiefly money belonging to others. The group included real estate and development as well as banking and insurance companies. And of all those reporting, 20,538 claimed to have enjoyed no net income for the year in question.

The report gives many other interesting compilations that have to do with income and its distribution. For example, *all corporations paid out directly in interest the stupendous sum of $2,207,694,543. It was two and one-third times the amount paid in domestic taxes; itself a tremendous item, nearly one billion. The Federal Government's tax yield from the corporations was slightly less than their expenditures in interest. From the reporting corporations, interest took a toll nearly a quarter of a billion greater than went in the form of salaries to the officers of the corporations. The interest item was more than one-third as much as net income, that is to say, ultimate profits after all charges were met. And that is the year when corporation profits are supposed to have reached the highest point on record.*

So much for the returns of corporations.

Let's glance at like compilations having to do with those of individuals. We get there the reverse of the interest factor; for those compilations show what was received rather than what was paid out in interest by individuals.

A total of more than 5,000,000 persons filed income tax returns in 1919. They reported a gross income of more than $22,000,000,000. The sources of that income reported by persons are divided by the Internal Revenue Bureau into two general classes; personal service and property. The first covers salaries, wages, commissions, bonuses, directors' fees, and so on, which items alone, in 1919, accounted for 47.93 per cent of all personal income reported. It also covers earnings from trade, commerce, partnerships, farming and profits from incidental sales of real estate, stock, bonds and other property, which latter items accounted for 29.90 per cent of all personal income reported in 1919. This left 22.17 per cent to be accounted for by "pure" returns from property, or earnings that not necessarily resulted from some measure of individual effort or initiative. It is surprising to find that—despite the then arising howls against landlords—only 4.54 per cent was accredited to rents and royalties. Dividends appear to have yielded 10.94 per cent of all reported. Interest on bonds, notes, and so on, yielded 6.69 per cent of all, or one-third more than was reported under the headings of rents and royalties and two-thirds as much as for dividends—itself in many respects an interest item.

It may astonish many to learn that the aggregate of income reported from dividends shrunk between 1917 and 1919. *But interest gained hugely, or a total of nearly $600,000,000 during the two years.* The aggregate of all personal income reported as derived from interest in 1919 was $1,500,779,100 against $936,715,456 in 1917. Even the increase in the aggregate return from rents and royalties was not so great.

Who received the bulk of the interest thus reported as forming more than six per cent of all taxable income going to individuals during the year 1919?

An average of more than 10 per cent of income received by persons who reported $40,000 or more was derived from interest. From that income upward there was little variation in the proportion of income so derived by the different groups as arranged in the bureau's pamphlet. Below the $40 000 figures for personal income, the proportion derived from interest varied from 4.87 per cent in the case of those who reported from $1,000 to $2,000 to 9.88 per cent for those in the $20,000 to $40,000 class. Dividends show more extreme variation for the different classes of income takers. For the lowest they yielded only 1.4 per cent of the average income, while the highest, 61.10 per cent, came from that source.

It may be curious to note how rents and royalties supply much smaller proportions of big incomes than do interest or dividends but larger proportions of the smallest incomes. Those who reported incomes of $1,000,000 or more did not credit more than an average of about three per cent to rents and royalties, while those who returned incomes of $3,000 to $5,000 stated that rents yielded 4.33 per cent of all they received.

The following table shows the distribution of personal income in 1919 from each of the sources a grouped in terms of percentages:

Income class	Wages and salaries	Business	Partnerships and personal service corporations	Profits from sales of real estate, stocks, and bonds	Rents and royalties.	Dividends	Interest and invest- mer inc
$1,000 to $2,000	77.25	8.95	1.503	2.300	3.830		
$2,000 to $3,000	69.14	16.31	2.539	1.708	4.337		
$3,000 to $5,000	52.50	23.97	5.14	3.66	5.6		
$5,000 to $10,000	36.60	26.03	9.22	6.26			
$10,000 to $20,000	32.70	16.89	12.14	6.79			
$20,000 to $40,000	28.36	12.40	14.30	6.3			
$40,000 to $60,000	23.39	10.57	16.83	6			
$60,000 to $80,000	20.33	10.32	18.47				
$80,000 to $100,000	19.25	8.60	20.83				
$100,000 to $150,000	15.40	8.88	23.1				
$150,000 to $200,000	12.41	7.74	24.1				
$200,000 to $250,000	11.26	8.20	27.				
$250,000 to $300,000	9.80	6.55	29				
$300,000 to $500,000	8.19	8.12	2				
$500,000 to $1,000,000	5.38	4.41	[illegible]				
$1,000,000 to $1,500,000	1.34	7.73					
$1,500,000 to $2,000,000	8.54	6.40					
$2,000,000 and over	.32	------					
Total	47.94	17.28	8.

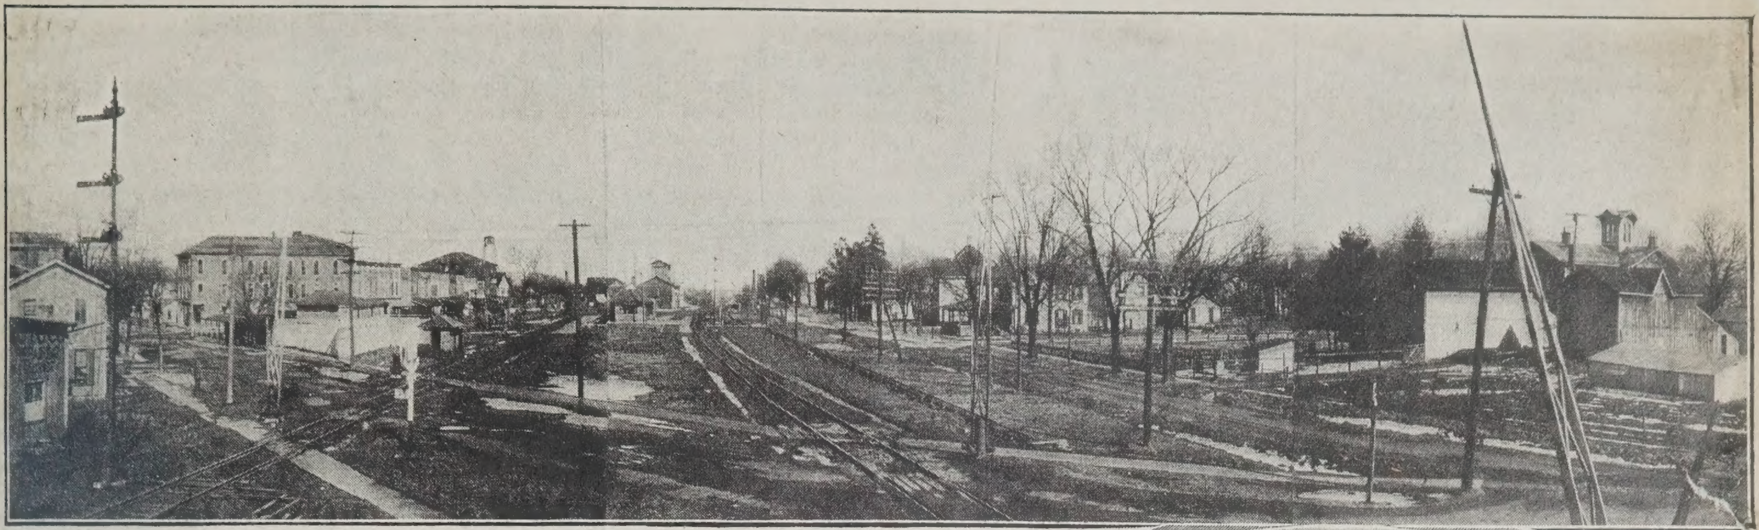
No Civic Suicide for Ohio Village of Osborn



Osborn as it appeared in February, 1920.

By HARRY PENCE

MARK TWAIN once remarked something about the reports of his death being grossly exaggerated and Osborn, Green County, Ohio, has had the same experience, to which it has made a very similar response.

Osborn isn't going out of existence after all. This ought to gratify all who have the welfare of American municipalities at heart, for it is a splendid illustration of how potent civic spirit may become, what even a small community can do when its people pull together in co-operative harmony. It also proves that, despite the words of a great poet, there is much in a name.

After the Miami Valley flood of 1913, which took more than 400 lives and inflicted a property damage in excess of $60,000,000, the people of the valley determined that such a disaster must never recur if human intelligence and energy and money could prevent it.

A way was devised and the great Miami Conservancy project was the result. A feature of that undertaking is that though the flood did not damage Osborn to any extent the flood-prevention plans provided for her complete destruction.

The main feature of the project consisted of five big retarding basins created by dams across the valleys of the upper water courses. These dams were designed to hold back the water and permit its flow into the main stream only in such volume as its channel could carry.

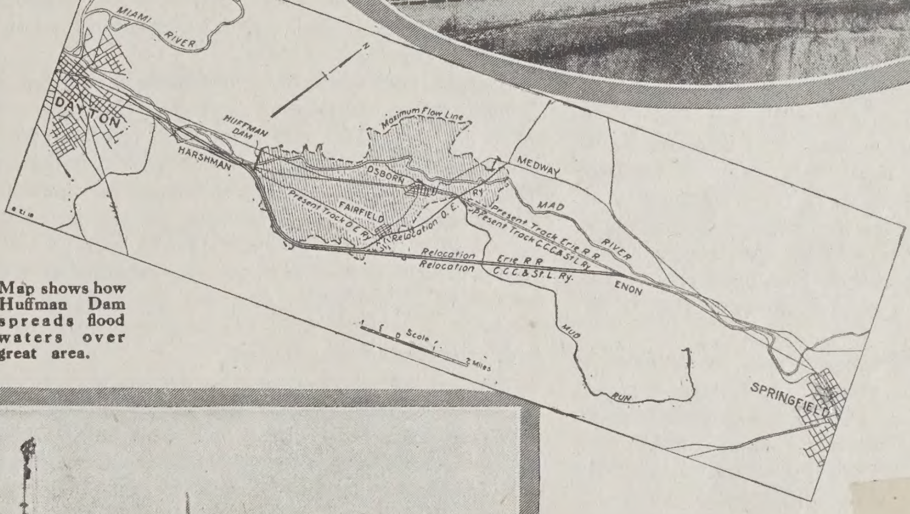
Osborn, a pleasant, thrifty village, on the main lines of the Big Four and the Erie railroads and the Ohio Electric traction line a few miles east of Dayton, lay in one of these basins. If, after the dam were built, there came a flood approaching that of 1913 a lake would form behind the dam and water would rise above the upper floors of the tallest building in Osborn.

There was no help for it. The complete safety of 400,000 in the valley below and property worth a quarter of a billion dollars depended upon these dams. One little village could not stand in the way. Nor—very evidently—could it remain.

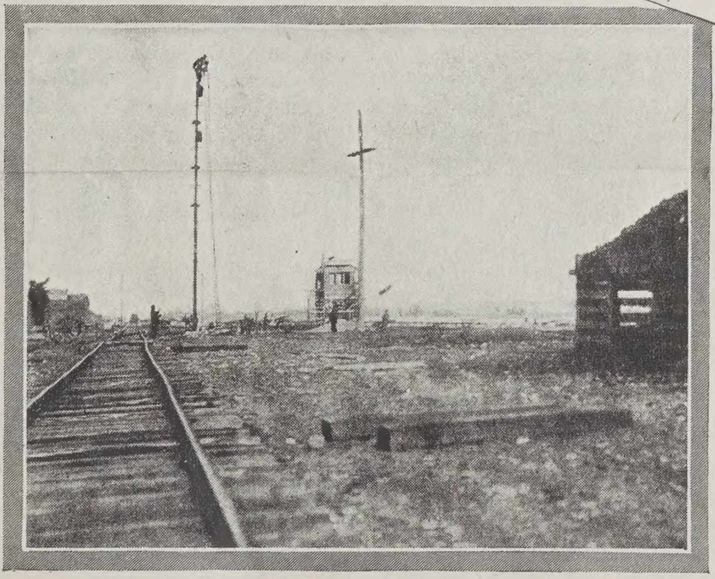
Osborn didn't want to go out of existence by fire, water or any other means. She had grown and become, because of her rail and trolley connections, the metropolis of the surrounding country. In population and volume of business she had outstripped her older neighbor, Fairfield, which remained undisturbed by the flood-prevention work. She sought relief in the courts, but provisions for the greater good of the greater number prevailed, so, when it was realized that the railroads and the traction lines would eventually be "relocated," Osborn sold herself out. The directors of the Conservancy district bought all the public and private real estate of the place and then turned their attention to other details of their gigantic undertaking.

But, as subsequent events demonstrate, the Osbornites are not migratory or rambling people. Their sense of location and love of home are unusually well developed. In the main they lived on in homes they no longer owned and tried to pursue the even tenor of their ways as if nothing had taken place. They realized, as the Huffman Dam, four miles below, grew to greater and greater heights and as the "relocated" rails were laid that would soon take their means of communication from them, that the break-up and the parting of the ways could not be indefinitely postponed.

Huffman Dam, four miles below Osborn, holds back the flow of Mad River and creates a little flood that covers three and one-half square miles.



Map shows how Huffman Dam spreads flood waters over great area.



Site of new Osborn, February, 1920.

Then the village of Fairfield, about half the size of Osborn, and, heretofore, very naturally the object of mild jealousy and ridicule in Osborn, invited the Osbornites to come over and make a bigger and a better Fairfield.

This seemed to crystallize an idea that had been half-formed in many minds. If their general removal to Fairfield was practical or desirable, why shouldn't they all move to some other place where they could retain the name and the community spirit of Osborn? And if so, why shouldn't they find a near-by location to which to move their homes as well?

The movement took on a businesslike aspect at once. A number of former property owners formed a corporation to direct and finance the undertaking and these were joined by practically all the heads of families of the village.

The corporation, which is practically an association of former property owners, planned the entire undertaking on a co-operative, non-profit basis. It bought back the buildings of the town in a lump at a very advantageous figure and also purchased a tract of land, adjoining Fairfield, which was almost ideal for the purpose. It lay above the highest anticipated flood stage, on level ground, with the traction line on one side and the railroad on the other.

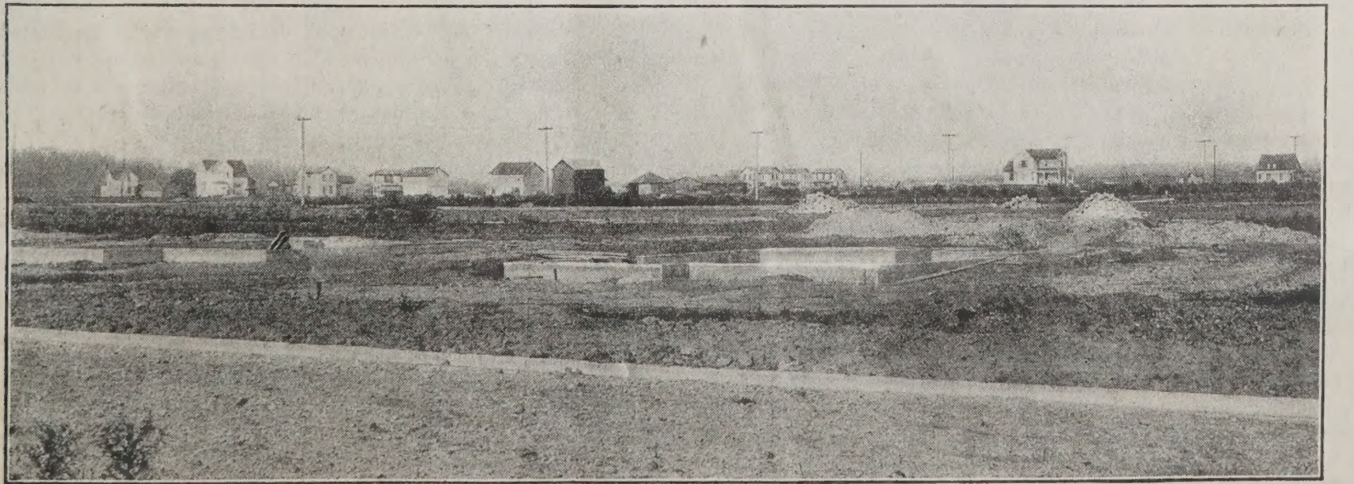
Architects and town planners were consulted and contractors invited to give estimates on the various lines of work.

The costs, as they will finally fall upon the individual property owner, are much less than the owners could have hoped for had each of them acted independently.

The contract for the moving was let to a single firm at a similar ultimate saving to the householder.

For months the work on the streets and foundations for the new town has been in progress. Nearly 100 foundations now await the houses for which they were built. The street work has progressed satisfactorily.

Aside from a scattered cluster of houses on a wide field, and row after row of cement curb-and-gutter, there is not much to show the casual passer-by what the new Osborn will look like, but the arrangement of the streets inicates that care and thought have been expended. The plan provides for gently curving thoroughfares instead of painfully regular, rectangular "blocks."



The new Osborn, some months later; note the excavations completed for the placing of homes from old Osborn.

Grand Opera Played on Football Gridiron

California Looks Forward to Annual Open-air Musical Festivals

By HARRY H. DUNN

ON A FIELD which had lately echoed to the shouts of football elevens, and to the cheering thousands of grads and undergrads, grand opera in the open air was tried out for the first time this summer, and proved to be an artistic, social and financial success. Where cheer-leaders had been the stars of the vocal effort on the football field of Leland Stanford University, at Palo Alto, California, Don José sang to his Carmen, Faust to his Margherite, and Beppe and Nedda harlequined their way through Leoncavallo's lighter notes.

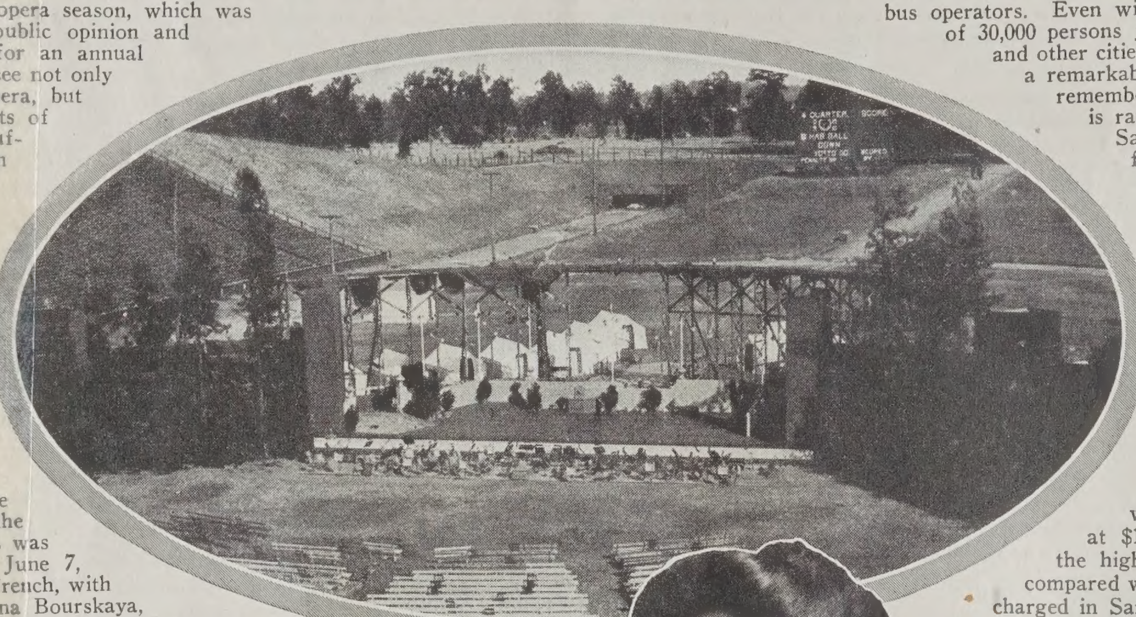
The great Stanford stadium, recently completed, with a seating capacity of about 40,000, was selected as the scene of the open-air opera season, which was in the nature of a test of public opinion and patronage, and a beginning for an annual musical festival which should see not only the presentation of grand opera, but instrumental and vocal concerts of large size. The results were sufficient to attract attention throughout the state and to insure a similar season of opera in the same place next year.

Four performances of opera were given on the regular program, and the results achieved were so gratifying that a fifth and extra presentation was made on the night following the fourth opera. "I'Pagliacci" was sung in Italian, on the night of June 3, with Giovanni Martinelli as Canio and the beautiful Bianca as Nedda (the Columbine of the play). This was followed, on the evening of June 7, by Bizet's "Carmen," sung in French, with the young Russian soprano, Ina Bourskaya, in the title rôle, and Martinelli appearing as Don José. "Carmen" was repeated on the evening of June 16, and on June 10 "Faust" was sung, also in French, with La Saroya in the rôle of Margherite, and Martinelli as Faust. Gounod's famous opera was repeated the following night, June 17, with the same cast, as an extra production, and this brought the season to a close. On the first night, following the short two acts of "I'Pagliacci," a ballet divertissement, arranged and directed by Natale Carossio, was presented.

Virtually all the profits of the season were turned over to funds at Stanford University, including the endowment fund, the Stanford Clinic in San Francisco, the fund for the enlargement of the organ in the memorial church, and the home for convalescent children on the Stanford campus. The university furnished the free use of the stadium, and the assistance of a number of students. This arrangement was found satisfactory to both parties and will be followed again next year by Gaetano Merola, who originated the idea, financed the project and directed the operas. As a first-time presentation of the always difficult open-air production of opera the season was an unqualified success and Merola added greatly to his reputation in the musical world as impresario.

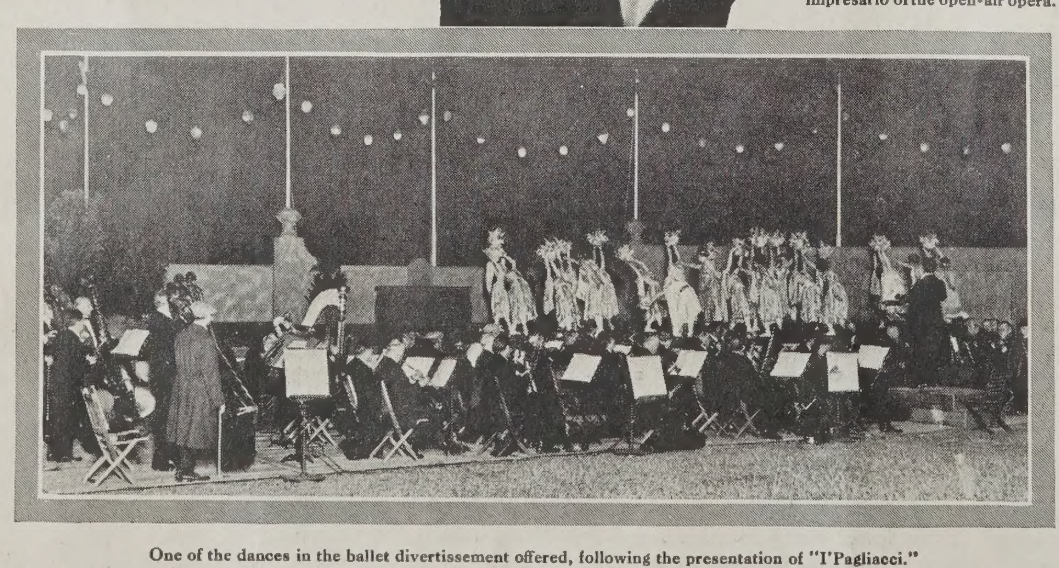
Almost as interesting as the singing of the eight operatic stars from eastern centers, or that of the chorus of 150 voices recruited in San Francisco, was the method of presentation of the opera, the first ever attempted in such a locale. The stadium, sheltered by its high earthen walls, towering far above even the proscenium arch of the stage, furnished an auditorium of even temperature, and climatic studies were made to show just the days on which there was least probability of rain, and when there would be a full moon for much of the period. Then a stage, 80 feet wide and approximately 30 feet deep, was constructed across the northern end of the stadium, so that three-quarters of the great bowl lay in front of it, and one entrance to the back. Large trees were transplanted, forming wings on either side of the stage, and a wooden backdrop was provided. Tents, set in a semicircle back of the stage structure, furnished the dressing rooms, and it was found early in rehearsals that the rear walls of the stadium, converging toward the northern entrance, formed such an excellent sounding board that the acoustics could not be improved by an artificial back-wall.

The ingenuity of electricians and motion picture projection experts was then called in, and, in lieu of a curtain of cloth, a curtain of multicolored light was provided, projected from two high wooden towers, set one on each side, about midway down the stadium, in front and at either wing of the stage. This curtain of light completely closed the stage to view from the front between the acts as perfectly as any actual curtain could have done. Varying lights and motion picture scenes were used in the operas, in place of elaborate scenery. For instance, when Faust came singing down the village street, that street was a motion picture—still, of course—thrown on the stage, and through it Gounod's hero strolled to meet his Margherite. The effect was novel, perfectly satisfactory, and will be used in other outdoor productions of plays and song-cycles in San Francisco and Berkeley. So far as known, this is the first time that motion pictures have been synchronized to furnish the scenery for operatic productions, and very little rehearsal was necessary for the various singers to step "into the picture" as naturally as though they were walking amid stable scenery set upon the stage. Ray Coyle, of San Francisco, was responsible for the curtain of fire and the scenic use of the motion pictures, and was aided in working out the details by the technical department of Stanford University.



Looking from the "gallery" into the "dress circle" and across the stage of the theater in the stadium of Stanford University.

GAETANO MEROLA, impresario of the open-air opera.



One of the dances in the ballet divertissement offered, following the presentation of "I'Pagliacci."

Another lighting feature was that of keeping such sections of the stage as were not intimately involved in the action of the opera in the background by means of dull lighting, and then bringing them out more brightly as the action moved to and about them. This has been done before, but never on the scale it was accomplished on this stage, which was approximately three times the width of any San Francisco theater stage, and, therefore, allowed the use of real trees, and of life-size scenery, where scenery was necessary. The orchestra consisted of 110 pieces, made up of members of several orchestras from San Francisco. Plans had been made for an orchestral and vocal concert, with 100 musicians and the choir from the College of the Pacific, with Doria Fernanda and Vicente Ballester, of the opera company, as soloists, on June 4, but this idea was abandoned in favor of the extra production of "Faust" on the night of June 17. Public demand favored the opera.

Seats were provided for 18,000 persons, and, while the attendance never reached one-half this number, the audiences were considered extraordinarily large for a production so far from the center of population of this section. Transportation methods were very inadequate, and this was responsible for the fact that the attendance was not so large as had been hoped. Next year the transportation arrangements will be in the hands of an experienced transportation expert long before the season opens, and it is hoped that greater co-operation can be obtained from railroads, electric lines and motor bus operators. Even with poor transportation a total of 30,000 persons journeyed from San Francisco and other cities to attend the five productions, a remarkably large attendance when it is remembered that the Stanford stadium is rather more than 30 miles from San Francisco, and still farther from the city of Oakland, and the musical, artistic and educational center of Berkeley, on the eastern shore of San Francisco Bay.

The point brought out by the entire production is that opera, even under difficult and unusual conditions, can be made attractive to large numbers of persons, and can be made financially profitable, if handled on a business basis. One factor was the scale of prices. There were thousands of good seats at $1; thousands more at $2, and the highest price charged was $5, as compared with the $3 to $10 prices usually charged in San Francisco and other western cities for opera. Careful arrangement of the seats, the large size of both stage and stadium, and the excellent lighting and sound-carrying effects gave every one of the 18,000 a good seat.

The company which sang the five programs consisted of Giovanni Martinelli, tenor, of the Metropolitan Opera Company; Ina Bourskaya, Russian soprano, of the Metropolitan; Vicente Ballester, baritone, Chicago Opera Association; Bianca Saroya, soprano, Boston Opera Company; Leon Rothier, basso, Metropolitan; Doria Fernanda, contralto, San Francisco concert and operatic singer; Georgianna Strauss, mezzo-soprano, and Marsden Argall, a young baritone. The ballet of 50 members, like the chorus, was recruited largely in San Francisco and other Northern California cities, under direction of Natale Carossio, of the Metropolitan and Chicago Grand Opera companies. Incidental dances were presented by this ballet, led by Miss LeMain, with each of the operas. Merola personally directed the orchestra.

Gaetano Merola's love for his own city inspired the open-air opera. Merola was reared in San Francisco and received much of his musical education in that city. He sang and played and directed his way through Europe and the Eastern United States. About three years ago, he began working on the plan of the annual music festival, which crystallized into the outdoor production of opera. Adopting a somewhat different plan than that usually followed in presenting a season of opera, Merola financed the bringing of the singers to the coast, and the cost of erection of the stage and other preparations for the productions. This businesslike method of handling the whole project attracted the attention of San Francisco music-lovers, business men and others who are not usually connected with the regular ring of those who finance by subscription the social event known as a grand opera season each year. All these gave Merola extensive and permanent support, and present indications are that the permanent result of this unusual musical affair will be an annual presentation, not necessarily of opera, and probably not always in the Stanford stadium, but regular in its appearance, near San Francisco, for the benefit and entertainment of all music-lovers of Northern California.

It is understood that prices for the seats are to be kept at the comparatively low level of this production, so that the affair will not degenerate into a social event for the few who can afford it, but will be available to the majority of the people. There are certain indications, too, that the city of San Francisco, and, to some extent, other cities around San Francisco Bay, will help in the establishment of an annual musical festival, to be held in the out-of-doors in June of each summer.

Official Apathy Deprives People of Old Masters

Paintings of Revolutionary Heroes Held in "Storage" in Philadelphia

By WM. A. M'GARRY

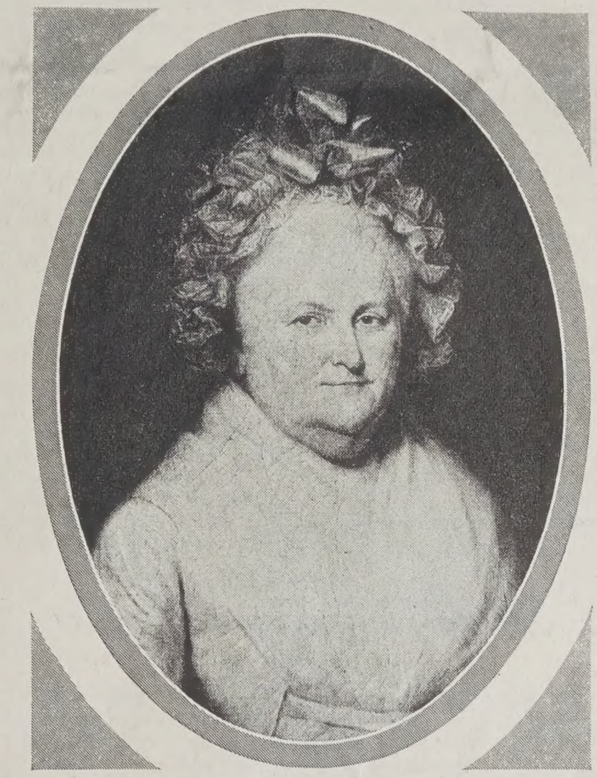
HOT and cold storage for the priceless paintings of old American masters has become so much a matter of course in Philadelphia that residents of that city have ceased to protest about it. One collection, appraised at more than four million dollars, has no interest for outsiders save from an artistic point of view, and since it is owned by the city they have no right of protest except possibly on esthetic grounds. In the other, however, every American citizen has a birthright that has been denied him by tardiness of some city officials and usurpation of power by others for more than five years. That is the collection of paintings by leaders of the profession who lived just before and after the Revolutionary War, and who painted signers of the Declaration of Independence, great American generals and other characters inseparably bound up with the struggle for American freedom.

Until 1917 that collection was exhibited to the public on the walls of Independence and Congress halls. Since then it has been packed away in dark rooms and cellars, its famous works of art gathering dust, the paint cracking and scaling away, while politicians and autocrats of art in Philadelphia wrangle over the expenditure of funds and other matters with which the bulk of the American public has no concern. Citizens of Philadelphia are, of course, responsible by their indifference for that condition, but in justice to them it should be said that they do not realize what an insult it is to national patriotism. To them Independence Hall is so familiar that they rarely give thought to its historic significance and the inspiration it furnishes to those who see it but once in a lifetime. Some earnest patriots may deny that assertion, but let the record of what has been done there speak for itself.

Neglect has been the lot of that famous group of buildings for the greater part of its existence. It should be a national shrine, under government control. Instead, it is and has been for years the plaything of politicians, "restored" again and again, parts of it at times almost falling apart, used for years by all sorts of organizations as a meeting place, and now partly closed during another "restoration" on which hardly any work has been done for a year.

Independence Hall—as readers will remember who have seen some of the familiar photographs of it—comprises a group of structures; the main or central building, two arcades connecting it with two-story buildings or wings, and two larger buildings just beyond the wings. The building to the west is Congress Hall, where the Continental Congress held its sessions while Philadelphia was the capital of the nation. That to the east is a replica of the same structure, and is the place where the first Supreme Court of the United States held its sessions for many years. When the Capitol was removed to Washington it became the City Hall of Philadelphia. Still later it became a dilapidated wreck, restored only within the last few years.

The business of restoration has been a profitable one for contractors down through the years. But nothing that has been done in the hall itself is so much of a menace to national relics as the treatment given the paintings. If all the buildings were destroyed, it would be possible still to recreate them from the plans. The paintings could not be duplicated. In some cases they represent the only copies known. It is said that if all the other collections of Revolutionary paintings in the country were brought together they would not equal in number, variety and historic importance the group that Philadelphia has kept in the dark for five years.



MARTHA WASHINGTON

By Rembrandt Peale.

It was just after the United States got into the World War that the paintings were taken down from the walls of the two buildings. The collection comprises about 120 examples of genuine early American works. In addition, there were nearly 300 later paintings, copies and copies of copies, made by modern artists. It was the consensus of opinion among artists and historians that such later works had no proper place in the two halls, and for some years a fight had been waged for their removal. During all of that time the Independence Hall Advisory Board, which then controlled the buildings, kept right on buying portraits as they were offered by certain favored artists without much regard for the artistic value of the work or the historic importance of the subject.

As a result, the walls were covered with portraits of men who took but a minor part in the Revolution. There were many French officers whose main contribution to the cause was good will. Surgeons, Congressmen and others were painted until there was no more room on the walls. Then racks were set up on which to place the new paintings, thus hiding the view of the masterpieces on the walls. The collection became cluttered with fakes and paintings wrongly attributed. A painting of Joseph Whipple was palmed off somehow as that of William Whipple. Another of Captain James Cook, the English circumnavigator who followed the great explorer Drake around the world, was unloaded as a portrait of Patrick Henry. It was so marked and cataloged. A portrait of Arthur O'Connor, leader of the Irish Guards in Napoleon's Army, was put up as a portrait of Charles Lightfoot Lee.

An appropriation for the restoration of Independence Hall exactly as it was during Revolutionary times gave opportunity for the removal of all the spurious and unimportant paintings. That was accomplished, however, only with a great deal of secrecy. The Advisory Board never had any real legal authority, but it was politically potent. Members of the Art Jury took charge. That is an organization created by the state legislature, but it, too, is without any very tangible legal authority save what it grabs. The collection was separated into two parts, the genuine works of historic interest in one group, and the modern stuff in another. Then the Art Jury put both collections into storage. And so heedlessly was the work done that the masterpieces were given no more care than the daubs and fakes. That was shown a few years ago when it was discovered that mice had been destroying some of the really valuable paintings. Mice, of course, did not eat the paint. They were attracted by the presence of flour paste which had been used by somebody to repair cracks in the pigment.

All of that would seem ridiculous if it happened in some building of none but local importance. Independence Hall, however, is unquestionably the chief historic relic of the United States. That is shown by its record of visitors. The turnstiles show that it is the mecca of tourists, more than a million persons passing through its doors every year. And for five years guards have been monotonously informing those visitors that the paintings, about which so many of them have read in their school histories, are in storage, and nobody knows when they will see the light of day again.

In 1802, the legislature granted permission to Charles W. Peale, the famous portrait painter, to establish a museum on the second floor of the central building. It contained a number of portraits of distinguished persons painted from life by Peale himself and his son, Rembrandt Peale, and collections of birds, insects, fish, minerals and fossils. After the Capitol was removed to Washington, Philadelphia purchased the entire property for $70,000. Congress Hall was fitted up for the state supreme court, and the second floor of Independence Hall became the meeting place of the city council in 1854, being used for that purpose until 1895. In 1854, the city purchased from the heirs the remnants of Peale's Museum. Nearly 30 years later the commission named to prepare the historic group of buildings for the Centennial Exposition found 13

Paris, the Sham and the Real, of Post-War Days

Stories in Which France Is Brought Into Relief by Trained Observers

Hunting a Job—High Pay $40 a Month—Impressions of Frenchwoman After a Two-Years' Sojourn in United States

IT'S A SOFT, cool day, neither summer nor autumn, as we have many in France after a storm. I am writing under a peach tree, whose branches, weighted down with fruit, seem to try to kiss the ground at each swing of the wind. This makes a delightfully cool summer house for me, my pillow and my ink bottle. The breeze is nicely blowing its breath through the leaves, and from time to time a peach falls and rolls on its velvet robe toward me.

I am enjoying a concert. Jazz? Oh, dear, no! A kind of a very soft and trembling music, somewhat like a ukelele string touched with a violin bow. The bashful artist, hidden behind the deep red roses and lavender balsamines near the stone wall, is a *cigale* (grasshopper), a fairy insect with wings of gauze, twice the size of a bee, a southerner by taste, as all the musician artists are, and by temperament; for, when the sun denies us his summer beams our *cigale* creeps under the golden leaves of autumn and dies unseen. Roses of all colors, from deep red to a very pale tea yellow, are my horizon, and on my left is a forest of giant balsamines, odd flowers that look like lion's heads. Mingling their foliage with them, the white Christmas flowers are snowing over the poppies. The rear of the garden is such a tangle of cherry and peach and vine leaves that the stone wall which marks the end of my kingdom is completely hidden as behind a virgin forest.

Surrounded as I am by such beauty, there is ever the lurking regret that there is no one to enjoy it with me. All my friends here have gone—most of them are dead. Of the 19 girls of my class, six died in the last three years. One is so sick in the house near mine that the doctor said she won't last overnight. Broken heart, they say; her brother and fiancé were killed in 1915, and her father the day before the Armistice. The others of my friends contracted tuberculosis, for they were not strong enough to stand winters without coal or food in '17 and '18, and even '19 and '20. It's the same among boys, especially those who were 12 or 13 at the beginning of the war. It's an obsession. I avoid going out, for I am sure to meet some poor, black-veiled mother who cannot help weeping when she sees me.

America has given me "new" eyes. I am seeing things so differently than before that going through Normandy I shared the eagerness of my American friends not to lose a speck of the landscape. It is so different! The beautiful pastures are separated by walls of flowers and the little farms in stone have stone walls around their borders. As it was sunset and time for the cattle to go back to the stables, the little girls in wooden shoes and black pinafores, two braids of hair dangling down their backs, were driving cows and sheep with a stick of ash five times as long as themselves. For the first time I noticed the wonder which makes the hills look like patched pieces of material, the patches being taken from the family rag bag, as shown by the hundreds of different colors. You see, each farmer takes pride in raising a little bit of everything, enough for his own consumption. So he divides his few acres of land in a chess-board manner and summer makes them rainbow-colored.

And the Seine gently flowing under its old bridges! I can't remember ever having admired this lovely stream as I did from the train. Then Rouen, with the spire of its cathedral like a shadow on the clouds. And then Paris! A volume could be easily written about Paris, and some day I may attempt it, but now I am thankful about one thing: I didn't get run over. It is more difficult to escape this fate than you think. Although most of the cars are down at the seaside, or in the country with their owners, at this time, it's a problem to cross streets and especially squares. Automobiles rush under the very noses of the policemen, and should those unfortunates try to reprimand the drivers, the crowd is ready at hand to enjoy the show, a course in Parisian slang free for all foreigners. There is absolutely nothing to do about it; even the American "techniciers" (specialists), who came over to paint streets with red lines, "gave their tongues to the cat," as we say; that is, gave it up. You know, over here streets were twisted around before automobiles were born, and are narrow enough for two bicycles, but too much for two Rolls Royces.

Anyhow, even with the thrill of being squashed flat any minute, Paris is delicious. I remained there two weeks, partly enjoying it, partly cursing it. I enjoyed it when I tried to get around thinking of nothing but Paris, showing its wonders to my American friends; I cursed it when I had to go hunting for a job. This is terrible. There is nothing, nothing, nothing to do. And *in case* there was something, I would get—guess how much! Well, because I have a secondary education, and because I know English, I would get $40 a month. Were figs and herrings not so expensive, I could live on that if I got back to my old menu of the Latin Quarter, 10 figs and two herrings a day. And without joking, that is what I am going to be obliged to do. I have discovered something cheaper than figs and herrings. Could you give me an idea? Tomatoes? Dear, no, in winter they are 20 cents apiece. Celery? In Paris, it is for the "nouveaux riches." Horse meat? I wish I could get that, but it is $1 a pound. Well, I'll do what the little "midinettes" and shop girls, who get $18 a month, do; live on coffee and bread. But since the first of September, bread is black, made with I don't know what, by order of the government, because we don't have money enough in the treasury to buy flour.

I got so discouraged during those sterile searches for work in Paris! Business is dead. Again and again employers, talking to me very seriously, told me: "We don't try to earn anything just now; all our efforts are toward *trying* to cut our losses."

I had some hope for the American Library in France, but no, there was nothing for me to do there just now. As the librarian said, "You would be the girl I need if there were friends enough to pay you. We need to open another branch in the library and we need a more extended children's library, but there is no money."

As long as I was looking for a job, I couldn't think straight in Paris. There certainly are changes in France; it's worse than when I left two years ago. People are really suffering and it's a wonder how they can get along at all with money so scarce and foodstuffs and clothes so expensive.

By an American Observer

WHEN you hear or read about modern Paris these days such places as Place de la Concorde, Longchamps, Eiffel Tower, Boulevard des Capuchins and Montmartre inevitably stand out as the chief points of interest or the center of the "gay" capital's activities. In the order named, whether you have been there or merely revive mentally pictures of those places at random, you beget an idea of space surrounded by public buildings, gardens, bridges; or a vista of open country with its geometrically perfect racing track and grandstands; or the tall framework of steel that rises nearly a thousand feet into the air and that makes a good radio broadcasting station; or a section of a multinamed avenue that stretches from the Madeleine to the Opéra and that is the favorite loitering place of rich and poor; or, last but not least, that more or less fantastic and picturesque district whose gay or grotesque nomenclature is so frequently copied by New York's alleged duplicates of those places of pleasure.

Those are fragments of principal districts or scattered points of interest, ever old and ever new, but those, any and all, are the least representative samples of the Parisians' Paris. A few Parisians, but mainly Frenchmen, will be found among the crowds that, except for a few hours just before the dawn, never seem to thin out; the others are all strangers, even though they are not all foreigners. Those are the places whither one goes to spend money and not necessarily time, but the visitor to Paris who has seen only those places, or places of the same type—for there are imitations of the boulevards and the "hill" elsewhere in the city—cannot say that he has seen or knows Paris and its Parisians. He has merely been there, physically, and has seen little more than can be seen, at less expense and much more comfortably, at the "movies."

Only the Gayety of Any City

THE gayety of Paris is, after all, an imaginary state. Paris is no more gay and no more sorrowful than any other big city. It was so years ago and it is so now. There are epics in the history of Paris when gayety not only existed not at all but was unknown—and by the same token there are districts and streets today where gayety is represented by whatever stray beams of sunshine filter through for a few fleeting hours.

It is no passing state or attitude, and it has nothing to do with the war, although this may have accentuated it here and there. It is merely the state of being of the fringe of a big city—of any big city. Conditions vary, circumstances differ, but it is the real Paris—as real as the boulevardier's Paris is sham.

One sees fleeting, serious, modest humanity; men and women and boys and girls, not too well dressed, rarely shabby-appearing, going somewhere or returning from somewhere, but this going and coming has to do with the business of life and not with the business of killing time along adjacent neighborhoods. This man is what the Europeans call an "usher," but which we call a messenger, with a well-worn black leather portfolio, containing papers and money and notices and receipts. Because it is a position that presupposes responsibility, the man wears a black suit and what appears as a starched shirt, but is only a dicky superimposed over a percale negligee. Dickies are almost universally worn in Europe by men who must maintain a front and find haberdashery and laundry charges too dear.

Follows a young woman holding a little girl by the hand. One may stop and wonder what that little girl's future has in store for her, but it is evident that the mother is one of those countless women who must manage their domestic dominions somehow, hurrying for the bargain that means the saving of a sou, alert against the temptation or possibility of spending more than is necessary. One may almost surmise that she—countless are those she's—is an ambulant human calculating machine, who starts out of a morning with a sum fixed in her mind, split in various ways for as many items that must balance to the centime at the end of the day. No business man was ever more particular about inventory than is such a woman, except that he undertakes his stocktaking once or twice a year and she does it every day of the year. These are the women who have more hero-stuff in them than all the soldiers.

Ah, a working boy, with his ill-fitting trousers and a dark blue "veston" that is much too large for him, but that will protect his garments underneath. He looks like the sort of boy removed from the ragamuffin class in that he has a job and is self-supporting in a business-like way, but there is something missing in his care-free air. He sways back and forth, zigzags along in uneven and erratic steps, suddenly flattens his nose against a window full of knickknacks dear to a boy's heart and his glance is fixed upon a watch with exposed movement.

As we plod along these side streets of the real Paris we see real people; the kind that—to explain it universally and briefly—you can transplant from any one city under the sun to any other city under the same sun and find that they fit or "belong." It is representative humanity, that part of it which has no time or patience with organized perpetual amusement and idleness.

Of course, it is reported that "gay Paris" is an income-producing idea. Idea is the right word because Paris sells atmosphere and very little more in the way of gayety. Her amusements may be somewhat erotic, although most of this is mental attitude with no actual reality, but Paris has no monopoly, and their counterparts are to be found elsewhere. But what is, for comparison's sake, the relation of New York's Gay White Way as an income-producing district of the metropolis to the aggregate remaining income? Answer that and you answer the other.

Undoubtedly Paris, as a municipality, benefits from the fame it has acquired, and yet it is true, all too true, that seven-eighths of the people do not know how the other eighth lives. There are many Parisians who are strangers in Paris, once they trespass into wards that are as foreign to the one in which they were born or reared.

One would imagine, judging from current reports of semi-tourist type, that Parisians have nothing to do but think of which cabaret to spend the day, which café to select the next day, and which "girl" show to witness the day after that.

But the last thing Parisians think about is the pleasures, such as they are, that are devised or invented in their own city. There are Parisians who have never been to a *bal*, or a famous café, or some Coney-Islandish amusement that the average tourist jots down in his schedule as the first place to see after leaving the train.

In a city that is supposedly unmoral, where free love is supposed to be rampant, where the now disintegrating and fast-disappearing Latin Quarter of half a generation ago was supposed to be the cradle of numberless escapades, where apaches are supposed to spin their women like whirling dervishes and call it a dance, and summing these things together, plus a host of others, you beget an aphrodisiac city, but what is really the case?

The fact is that Parisians, like Detroiters, think marriage and home, like all other normal human beings. It is only recently that an informal organization of young women was started with a view of inviting marriage. The organization—I do not know how extensive it is—taking a hint from the Legion d'Honneur but a different color—requires its members to wear a green ribbon. It is intended to confer upon the wearer recognition of marriageability, which means that men are supposed to know that she is a prospective bride.

Army of the Green Ribboners

AS IN Paris, according to late census figures, there is a majority of 100,000 women out of a total of both unmarried sexes of 1,200,000, the "green ribboners" would constitute quite an army. And those figures do not include 235,000 widows!

But what are their chances? About two-thirds of the men receiving unemployment allowances in France reside in the area of Paris. Very few of the men that would like to marry and have homes of their own can satisfy their ambition, due largely to the economic improbability of making ends meet. Those whose financial position is better suffer from what I consider the most retarding influence of all, not only in France but in other European countries; the fashion of the dowry. Too many marriageable men have an eye on the dot instead of the woman. There is a tendency to ignore this inherited custom, but not enough as yet to show any result in vital statistics.

Along the Rue de la Paix, in the neighborhood of the fashionable and world-famous dressmakers, or along the neighborhoods of the finer shops and department stores, one sees a somewhat conspicuous, over-fashionable, blasé type of Parisian girlhood, the type that is photographed and thus exposed to the world's gaze, with the hint that she is careless, free, debonnair, that she snaps her pink fingers to the tune of an *Ooo la la* or two. This type exists, but it is not representative; not any more than is the American prototype that idles in the West Forties of New York. The majority adopt the pose, but in reality they are half scared to death, and they hurry home as soon as possible after leaving their places of employment.

The fact is that French girlhood, in Paris and out of it, is predominantly domestic stock, notwithstanding that nationally motherhood is on the decline. Give the average French girl a bare room and she will turn it in a jiffy into a nest—which in her mind is a superlative of home. She likes the frills that add to attractiveness; she likes to potter around.

But such is life; the chances to give full sway to her ideas and hopes are few, and she cannot be blamed if, due to economic conditions or other causes, she emerges as the common-law wife of an honest and God-fearing gendarme. But the green-ribbon movement is one in the right direction, and it is quite a commentary—a most encouraging commentary—of the at-

(*Concluded on page 15*)

What the Einstein Test Can and Cannot Prove

Fact That He "Forgot" to Credit Others Before Him Can't Be Overlooked

By ARVID REUTERDAHL

ANOTHER attempt was made September 21 to prove the correctness of the so-called "Einstein Theory." Astronomers from many parts of the world then observed the eclipse of the sun to determine the exact scientific value of the contentions of Einstein. Observers were stationed at Maldive and Christmas islands, at Cordillo Downs in Central Australia, and on the northwestern coast of Australia. The scientific fate of Einstein, it is claimed, depends upon the photographic evidence gathered by these astronomical expeditions. Two sets of photographs are now being compared. One set was made some time before the eclipse and the other at the time of the eclipse. Both sets of photographs show the same field of stars. Cable reports received at Lick Observatory state that the observations were successful. That does not mean that the Einstein Theory has been vindicated but that the weather and sky conditions were such that it was possible to produce good photographs.

It is natural for the average man to wonder why another test of Einstein's Theory was necessary. In view of the many laudatory works on Einsteinism why should costly expeditions be made to procure a few photographs. In spite of all the flattering comments, unadmitted doubts concerning the truth of the theory must exist even in the minds of the Relativists, for otherwise there would be no need for representatives from their camp to partake in new observations. Criticism of Einsteinism has appeared despite the efforts of the controlled publishing organizations to prevent the publication of anything unfavorable to the tenets of the prophet of Relativity. The majority of our American scientists are unaware of the fact that a large number of works against Einstein have been published in Europe. These works are not to be found in any of our libraries. They have a peculiar way of not reaching the shelves of our American book collections. The well-organized Einsteinian Relativists have cause for serious alarm at the rapid growth of anti-Einsteinian literature in Europe. Fair-minded thinkers have protested so vigorously against the enforcement of Einsteinism upon the world that more tests have become the order of the day.

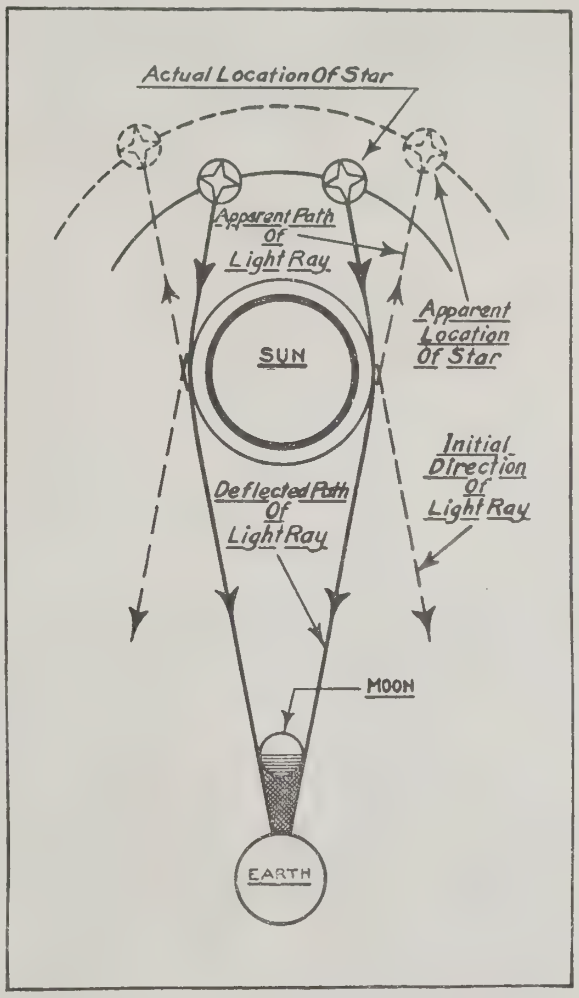
Vagueness Aids Einsteinism

EVEN now everything which concerns the theory is in a state of confusion. What the recent test *can and cannot prove is not defined.* Vagueness and indefiniteness are the strongest bulwarks of Einsteinism. The Einsteinian Relativists are feverishly hoping that the results of the latest tests, which are now being computed, will confirm the calculations of Einstein. Then they will loudly announce to the world by cablegram and radio and by a flood of publicity of which they are the controlling masters that Einstein has been completely vindicated and that Einsteinism is the greatest scientific achievement of the ages. No fair-minded person will hesitate to bestow honors upon anyone that has justly earned the right to such recognition. But the bestowal of honors upon one man must not be done at the expense of justice to others even if the multitude clamors for the glorification of a popularized idol. Honors cannot justly be dispensed without thorough knowledge of all the facts involved and these facts must not be brushed aside lightly to accomplish a prearranged end.

What then were the issues at stake in the latest astronomical test which was conducted September 21, 1922? Let us assume that these tests will show reasonable conformity with the computations already made by Einstein. Will that fact be sufficient to prove the truth of Einsteinism? If we reply in the negative to this question then what will be the exact worth of the results of the new tests? In the following I will define the precise significance of all the involved issues. My statements will be based upon unprejudicial facts which cannot be gainsaid because they are supported by undeniable evidence. He who fails to admit the truth of this evidence will find himself either in the unenviable position of a prejudiced, and, therefore, unfair partisan, or a spineless beneficiary of a corrupt condition.

The questions involved may be limited, at the outset, by a division of the content of Einsteinism. We, therefore, ask the question: Was the total content of Einsteinian Relativity involved in the recent tests? Emphatically no! It should be easily comprehended that only that portion of Einsteinism which deals with the same physical factors and actions which were involved in the test was at stake in the new trial. What then were these elements?

Certain stars beyond the sun send out light rays which reach the earth. When the sun is shining brightly, as at midday, we cannot see any stars, no matter where they are located. The sun's disc will shut off from view certain other stars directly back of it. These we do not expect to see under ordinary circumstances. Stars just within and ordinarily hidden by the sun's disc can, however, be seen, provided that the dazzling light of the sun is cut off by some physical means. The moon serves as a shutter, cutting off the sun's light at the time of a total eclipse. On May 29, 1919, this phenomenon happened and the observations were made which gave the greatest impetus to Einstein's Theory. If the light rays from the stars, which are hidden by the sun's disc travel in a straight line, they will pass beyond the earth's surface and therefore be invisible to any observer located on the earth. The only way to force these rays to reach an observer stationed on the earth is by actually bending them around the edge of the sun and thus causing them to converge upon the earth's surface. It is logical, therefore, to infer that if stars which are actually hidden by the sun's disc become visible to an observer on the earth, their light rays must have been bent around the sun permitting them to converge upon the earth. This actually happened at the time of the famous eclipse of May 29, 1919. The fact was ascertained by photographing the actual and the apparently displaced positions of these stars. The actual positions were contained within the area enclosed by a line which passed through the deflected positions. This fact agrees then with the assumption that the rays from these stars were actually bent when they passed the sun's disc. The manner in which the apparent outward displacement is produced ought to be evident from the diagram. The amount of the displacement may be measured by a comparison of the astrographic plates for the actual and the displaced positions. When the distances from the earth to these stars are known the angles of deflection may be calculated.



Actual Location Of Star
Apparent Path Of Light Ray
Apparent Location Of Star
SUN
Initial Direction Of Light Ray
Deflected Path Of Light Ray
MOON
EARTH

In the year 1916, Einstein published an article in *Annalen Der Physik* in which he calculated this angular deflection to be 1.7" (second) for the case of rays passing near the edge of the sun (See "Grundlage der allgemeinen Relativitatstheorie," by A. Einstein, *Annalen Der Physik,* 1916, No. 7, page 822).

According to the Newtonian theory of gravitation this deflection should be half of the Einsteinian amount, that is, about 0.85" (second).

Would Discredit Newton

THE actually observed deflections as calculated from the observations at Sobral and Principe, May 29, 1919, were: for the Sobral test, 1.98" (second) and for the Principe observation, 1.61" (second). Therefore, it seemed that the Einstein calculation harmonized better with fact than the Newtonian. It was then and for this reason the Einstein was acclaimed a "greater than Newton."

Similar tests were made on the 21st day of September of the present year. Suppose that these new observations will give results which agree substantially with the results obtained at Sobral and Principe; can we then say positively that the Einstein Theory of Relativity is correct and the Newtonian theory is wrong? The partisans of Einstein are very desirous that this question shall remain in the form here stated. Justice, however, will not be served properly if we permit the question to rest as stated without modification. Moreover, in its present form, the question serves to lead us away from the consideration of the work done by others to whom Einstein has accorded no credit. The great majority of the Einsteinian Relativists have also adopted the suppressive methods of their master and refuse to mention the now well-known contributions of Einstein's predecessors. Whatever Einstein says on the subject of Relativity is regarded as oracular but if the same statements have been made by others before him then these earlier contributions are regarded as of no particular value.

The history of science is replete with cases of formulae based upon certain assumptions giving results which agree well with the results of observations. Later the assumptions have been found to be erroneous therefore necessitating a revision of the mathematics to conform more closely with the new ideas. No one can deny the truth of these statements. We ought to learn from experience. We should examine and appraise the assumptions of a theory with even more care than the alleged correspondence of their resulting formulae with observed facts. Still another factor must be considered. Observed facts always involve an observer and certain instruments of observation. Here then are two sources of possible errors. The observer, no matter how well trained, may err in his interpretations of the observed phenomenon and the instruments may lack the required precision. At a later date improved types of apparatus may prove the previous observations erroneous.

We cannot, therefore, ignore the suppositions and assumptions which serve as the background of Einstein's formula for the bending or deflection of light. The validity of his theory cannot be appraised upon the single item of mere agreement of certain observations with a derived formula. Rather must the worth of the theory be evaluated by considering it in its entirety. In the light of scientific history we are justified in questioning a theory if its assumptions are antagonistic to common sense and contrary to fact, even if its crucial formulae give results which apparently accord with the best experimental evidence that present observations can produce.

Consequently we are constrained to refuse to judge between Einstein and Newton merely on the trivial basis of a mathematical formula. We must ask the further question: What actual physical relations are involved in Einstein's formula? If a deflection of the light rays occurs when beams of light pass near the sun's surface, what reason does Einstein assign as sufficient to account for the phenomenon? According to Einstein, light rays are composed of material particles. Through a subtle mathematical scheme the path described by these particles is made to depend upon their material environment. They will be deflected toward such large aggregations of matter as composed the sun. They will travel along what Einstein calls "geodetic or geodesic lines" which he regards as tracks of motion in the universe. The actual amount of the deflection in the vicinity of a great material aggregate like the sun is represented in terms of a mathematical formula, generally accredited to Einstein but due originally to a man whose name he has never mentioned in his works.

What Einstein Has Contributed

TO APPRAISE the value of the alleged contribution of Einstein we must candidly examine the historic records to ascertain: first, the precise amount due to Einstein; and second, the actual value of his portion of the contribution. The particular averred discoveries of Einstein which are now under investigation involve the following issues: first, the assertion that a ray of light is composed of matter; second, that particles of matter are deflected toward matter groups; third, the magnitude of the actual observed deflection; fourth, the formula submitted by Einstein for its calculation; fifth, the assumptions upon which the formula is founded and evaluated; sixth, the agreement of this formula with observation; and seventh, the resulting status of the ether hypothesis.

First. Einstein cannot lay claim to priority in regarding light to be composed of material particles. The corpuscular theory of light advanced by Newton stands solidly in the way of any claims of this nature which Einstein may advance.

Second. The deflection of matter toward matter is not an Einsteinian discovery. Newton defined this phenomenon in his law of universal gravitation. If light rays are composed of matter then they will be appreciably deflected by large bodies of matter like the sun. In his "Opticks," Newton asks: "Do not Bodies act upon Light at a distance, and by their action bend its Rays, and is not this action strongest at the least distance?" In view of this plain statement of Newton, the priority in the matter of "bending of light" belongs not to Einstein but to Newton. In the year 1902, the writer presented a universal theory of interdependence which involved the deflection of light rays when passing in the vicinity of large aggregates of matter acting as intense force fields.

Third. Einstein is antedated in his attempt to calculate the amount of the deflection of light, for it is a well-known fact that Henry Cavendish (1731-1810) made such calculations basing his work upon the Newtonian theory of gravitation. J. Soldner, in the year 1801, calculated the deflection of light on the basis of the Newtonian law of gravitation.

Fourth. Einstein first published his formula for the deflection of light in the year 1911. (See *Annalen Der Physik,* 35, page 908.) J. Soldner first published his formula in the year 1801. The formula of Einstein is identical with Soldner's formula. Concerning this startling circumstance Professor E. Gehrcke, director of the Physical and Technical Imperial Institute of Berlin, writes in a special article contributed for my "Fallacies of Einstein": "The bending of light rays near the sun, as disclosed by Einstein, was made known by the mathematician Von Soldner over 100 years ago. It is very remarkable that Von Soldner's and Einstein's formulae for the amount of the deflection of light should coincide. This historical discovery was recently published by the well-known Heidelberg physicist and Nobel Prize winner, Lenard. But there is more to the story.

Sympathy Propaganda and Emigration Facts

Europe's Governments Would Shove Undesirables Upon Us

By A. R. PINCI

THERE are too many men in the city streets of Europe. In support of this statement, made without bias, I need only state that there are too few men in the country. In the boulevards and avenues of towns and capitals alike the keen observer soon becomes aware of an excessive number of natives, whereas the wide expanses of country separating those urban centers bespeak their estrangement from man.

During the last few years the American reading public has been treated to all kinds of opinions about what is the matter with Europe, but the real trouble has been quite neglected. The fact is that the average European population today is at odds with the natural resources of its country, whichever this may be, and is, nationally, attempting to carve out for itself the kind of labor that, in the aggregate, is economically inadequate. In most cases these European crowds are out of their element.

As it is from this group, and this group alone, that the migrating classes spring, it is not difficult to perceive why they would be twice removed from their native element once they gained admission to the United States or Canada. How they live now is a mystery, or almost one. One would like to know who these men are; where they intend going; what they are doing.

One need not detract one iota from their individual worth. The percentage of undesirables, from an economic standpoint, is negligible, as long as they remain where they are. As soon as they are [illegible] into groups, however, their individual [illegible] vanishes, to be substituted by a sort [illegible] ness that renders them anything but welcom[illegible]

Mingle in any of these crowds. No matter [illegible] their spoken word—Dutch, French, German, [illegible] Czech, and so on—and no matter what they [illegible] becomes aware of a peculiar and novel [illegible] drifting. In fact, it is a drifting crowd. It drifts mentally if not otherwise. There seems to be, though not always discernible so, too much lost motion. This trait is not exclusively European; it exists in Canada and in the United States at this time, and it goes without saying that an additional invasion of this kind is not desirable.

With minor exceptions aggregate groups of this type have become [illegible]. Here we encounter a paradox. Able-bodied and willing men are about, everywhere. They want to work. They chafe under the conditions that oblige them to [illegible] lost motion, as it were. But their [illegible], their outlook, their ambition, are softer than was the case a generation ago. Under one guise or another, they [illegible] determined not to do what [illegible]

The [illegible] the emigration problem today [illegible] adopted a selective [illegible] to find what they want [illegible] to emigrate, usually to [illegible] quest would be [illegible] to denote one out- [illegible] There may not be [illegible] wage earner, but at [illegible] than there are workers. [illegible] sort of hard work that [illegible] there is a surplus of idleness. [illegible] catered to a great evil of the [illegible] now ceased to be an emer- [illegible] bit—the unemployment dole. [illegible] these doles on the continent [illegible] their existence has not had a salutary effect upon the masses that, obliged to work, go looking for it conditionally. In a nutshell, European masses are looking for employment, but not wholly for work.

They Don't Like Restrictions

THIS attitude, intensified ethnically and racially, is what disturbs the leading statesmen of Europe, each in accordance with the circumstances and conditions extant in their respective territories. They would not mind unburdening themselves of inhabitants that *think* work instead of doing it. Those statesmen may realize, but will not admit, that both Canada and the United States have a bit of this problem to contend with on their part. No matter where you go in Europe, if you are an American or a Canadian and offer the chance for an argument, intelligent natives will criticize North American restrictive immigration laws as unjust, selfish and intolerant. You will hear these intelligent Europeans say that the war diminished their man-power, but if you refute them with facts and their own lamentations of excessive population today, they will glare. As a matter of fact, the average European, especially if he belongs to the property-holding group, is obsessed with the idea that natives who do not happen to be profitable are entitled to an asylum overseas. If either Canada or the United States, ready to offer asylum to certain desirable elements, suggests mandatory naturalization or some such self-preserving law, then there follows a squeal.

What has really happened is that the war killed off or invalided the flower of the hard-working individuals of the last generation. This was the worker who knew, to his own profit, how not to exceed his powers and abilities. He endeavored to beget of his life all that environment, plus experience, plus education, plus opportunity, put within his reach. That type of worker never drifted. That is the type that could not be separated geographically, which wrought the two industrial empires of North America.

Looking at another aspect of the thing, the war destroyed the element that is most difficult to replace—the agricultural workers. Population, numerically, has increased faster than the war diminished it, but the newcomers are preponderantly consumers. They are middlemen. They have one ambition, generally speaking, and that is to settle in urban centers. Hence, there is a shortage of homes in every city and town that I visited, from Denmark to Italy, from England to Poland. In the same measure, there are deserted homesteads and abandoned fields—so many of them that they are causing depreciated currencies and increased dole-lists.

Prior to the war a government job in the average European city was regarded ambitiously by a few individuals who underwent many privations to accumulate the necessary diplomas required of every applicant, but what of today? Today every European seems to pine for a government job, with the result that European governments have been debilitated by an excessive number of employes who muddle everything that they touch officially. The rubber-stamping fever is at its height.

It being impossible for the European powers to create more government jobs without risk of having more governors than governed, there being no work of the kind demanded, and there existing an unwillingness to get down to earth, literally and figuratively, European statesmen look longingly toward American shores. They look for themselves after a fashion, and for those of their fellow men who have to be provided for. They do not want it to be known that they look longingly, and some go to great pains to have it appear otherwise, fortifying these objections by means of rather involved regulations and laws.

Europe's Problem - People

THE daily newspapers that we read here feature so much the international situation from a peace-treaty standpoint that the American reading public regards said problem as the political sore of Europe, but nothing political, diplomatic or commercial so worries its statesmen, big and little, regulars and coalition, professional or temporary, as what to do with their populations, growing and not diminishing, a good part of which, not having the jobs that it likes, likewise has no faith, politics, party. Occasionally, in some nations more than in others, these dissatisfied groupings unite, merge or coalesce, or are brought together by chance, born of need and want, and become known as exponents of this or that new school of self-determining government.

It becomes an obsession, and if it has not attained tragic proportions except in Russia, it is because the fractional elements are too diversified, too widely separated, too immiscible—as yet. But every experienced traveler is conscious of this new atmosphere, and that is why, upon returning to America, he refers to it indirectly. It is the *something* occult, elusive, indescribable, perhaps, that overnight might change a smiling crowd into an angry mob. Not that this change will take place. The turning point has not yet been reached, and if statesmen—or those who call themselves that—revise their methods and really intend to accomplish by cooperation that which they are staving off by contrariness, the peril will remain, historically, imaginary. And the statesmen know it. Thus they have adopted a new system, new for Europe at least, that of playing to the galleries.

The ruthless methods of ante-war times are no longer in order; no governing official in Europe will dare to be curt with *his* public, when this selfsame public is split into many categories. Thus we can understand more easily why it becomes easier for them to blame everything upon another people or another government, and why this new political cult is intensifying the schism between Europe and the United States.

Let it be understood that it is not all ill will on the part of Europeans that is being bequeathed to Americans, because it is not; in the main it is a pose, dictated by exigencies. The only danger will be that the pose will develop into a sort of second nature.

It may have been noticed that the bulk of returning travelers who visited any of many European countries has made what may be termed a stock statement about conditions in that continent. It is a pessimistic statement. It is the statement, however, that the powers that be, plus the press, in those countries, wish reported back in the United States, and the best reporters happen to be these returned Americans. Thus these Americans are pro-European propagandists, paving the way for other propagandist attacks, political or financial, in the near future.

But do these travelers know what they are saying? Have they engaged in a real inquiry away from the beaten track of the tired business man who is obsessed with the idea that he is not a business man or a social bulwark unless he "does Europe" each summer? Going to Europe has become a habit, and not a very good habit, since very few Americans are courageous enough not to patronize in Europe and not to sympathize once they are back home.

The last thing Europe needs is sympathy, and yet that is what she thrives on today. Every day that passes, plus a delusion that the morrow will bring something that does not have to be worked for, prolongs the period of instability. Too many Europeans—of course the situation varies as between countries—almost believe they are as down and out as maudlin American sympathizers say they are.

It is a touchy and delicate matter to refer to American aid—governmental or private—to needy Europeans, but I—as a native European—do not hesitate to say that it is in general the worst possible service America can render. Every such aid is preceded or followed by some sort of a drive. So good Uncle Sam is considered good Uncle Samaritan. He always comes across. He is lavish with money and grain and other things in the throes of disaster brought about by European diplomacy and intrigue. The assurance that American aid is not slow in forthcoming is a great protection and temptation too to many intrigants.

The war was supposed to have decimated the various populations, but the fact is that population is much greater today than it was a decade ago. There is more work to be done in Europe today, from within, than there ever was before, and a very large proportion of its inhabitants could be put to work if any and all were not too busy killing time.

But even under present conditions, Europe is very well off. Europe is doing nicely. There is want and there is privation and there is disease and there is the "something wrong" that keeps people in turmoil, but in the aggregate the people are not so discontented as reports would have it. If any European mentions America, it is in terms of the dollar and not in terms of home or ideals. No matter how bad the situation is at any one point, the only temptation America offers is King Dollar—and no more.

Only a few days ago, I loitered about the bridge exit of the Cambrai Steel Company at Johnstown, Pennsylvania. It was five o'clock and the day shift was leaving the works. Very few young men—mainly men in the thirties and forties. They were foreigners, most of them, of the type that came over a few years ago, strong of arm, broad of chest, powerful of body, men who know how to work and will work. Steel mills are hard-work mills.

How many men of the same type could be drawn from Europe today? Not many, because there are not very many in Europe. The few that exist are employed and are quite happy in their present bailiwicks. I have watched the citified recruits from the country, which they left behind because its demand upon their time and physical powers did not agree with their idea of easy work.

Is it any wonder that Europe wishes to get rid of these undoubtedly interesting, pleasing, and otherwise ultra-modern chaps who prefer to wield a cane instead of a pick, who are one step removed from manicuring and a thousand away from the grime of honest toil?

At present they manage and they manage nicely—although not always in a way that can be understood—where they are. Mendicancy is almost a lost art; at least, it is not practiced as generally as before the war. The laboring classes abroad are the classes that live on the fat of their land because industrial conditions are in their favor. The good carpenter, the good mason, the good stoneworker, the good machinist, and all the other allied artisans, need not pine for work, and certainly the cost of living is of no consequence to them. It is not this class that breeds, at present, emigration recruits.

Waiting for the "Break"

EVEN the white-collared poor, of which Europe has an abundance, having become accustomed to existing conditions, is waiting for a turn of the tide. There are a few scholars among them, and many half-baked technical experts, mainly the product of the war, who, unable to find their industrial level, drift about and begin to think of North or South America, in the order named, with a view of exploiting their "knowledge." In this respect Europe differs not a whit from our own United States, where the proportion of unschooled scholars, impractical technicians and inexperienced experts, is still greater than it should be.

North America could, at present, absorb many thousands of honest-to-goodness skilled workers. Washington and Ottawa, in attempting to work out scientific immigration laws, have independently concluded that selective laws are essential, since the mere restrictive laws are inadequate and unscientific. But where are those workers? Europe has very few of them, available for export, so few that they need not even be considered. Moreover, foreign governments, by means that differ but whose object seems to be the same, have duly protected themselves against the loss of such workers.

Through the courtesy of Mr. E. W. Beatty, president of the Canadian Pacific Railway, and Mr. G. M. Bosworth, chairman of the Canadian Pacific Steamships, I was enabled to observe at first-hand the foreign activities of those companies toward gathering together desirable emigrants to Canada. Offices are maintained in the principal cities of Europe. Officials, high and low, of the company at Montreal, are traveling back and forth between the continents to lay the foundations for the right sort of migratory humanity. The company looks at it from the standpoint of dollars and cents, but not in cash. It builds up on the future value of immigration's productiveness.

Unfortunately, the good offices of the company bring results very slowly. Where the Canadian immigration laws are not an obstacle—which happens to be the case in many instances now through the letter and not the spirit of the law—the way is barred by foreign governments either through local laws or other obstructive tactics.

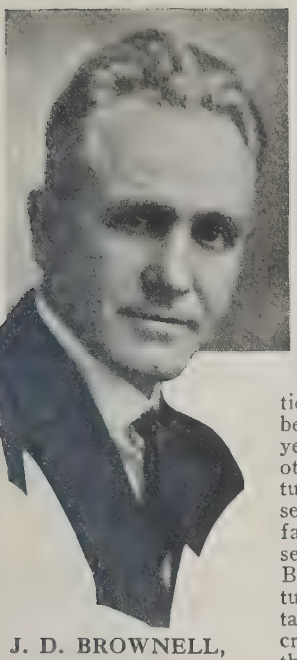
In a score of the leading cities of Europe I have seen prospective emigrants making the rounds for the necessary formalities of departure from Europe or entry into North America. For the few that gained their object there are the many, the very many, who failed to open the doors at this end or failed to open the exits at their end.

Having had experience with passport authorities at various times, both here and abroad, I can state that, premeditatedly or not, foreign governments undoubtedly have some sort of general classification for their nationals upon which to base their decision as to whether

(*Concluded on page 12*)

Northland—the College of the Stump Lands

Prize Herd of Cattle and Pumpkin Pie Help Young Folk to Education



J. D. BROWNELL,
President of Northland College.

By FRED L. HOLMES

LATIN and Greek and higher algebra are all very well as prerequisites for a college education, but in Northern Wisconsin there is a requirement that is even more fundamental—hands that are willing to do manual labor.

Northland College at Ashland, Wisconsin, is an educational institution that has sprung into being in the past few years. It is unlike any other educational institution in the state. For service to the pioneer families of the sparsely settled acres it rivals Berea College, of Kentucky, where the mountain boys tramp over creek beds and canyons, through gulches and gullies, for miles to get to the college that furnishes an education in return for part-time work. The Berea labor idea dominates at Northland. Ninety per cent of the students work their way through school. The boys operate the 160-acre farm; run the print shop, make cement blocks, do college janitor work.

The girls operate the dining halls, do all the cooking, dish washing and the necessary household work of the dormitories. Northland students have college athletics, debating societies and glee clubs. They do not have fraternities and sororities.

Girls at Northland College find the art of making a good pumpkin pie or baking good white bread more of a requirement than dancing at a social function.

The ability to milk cows, or make cement blocks is here a necessary part of the boys' education and the rôle of the "lounge lizard" and "tea hound" is unknown among Northland College boys.

Just on the outskirts of Ashland, where the chilling winds from Lake Superior and Chaquamegon Bay sweep across, Northland College is located. Not far away, on Chaquamegon Bay in 1665, the venerable Father Claude Allouez founded the first settlement in Wisconsin, and for four years labored among the Indians. Then he gave up his educational task. Two hundred and fifty years later there are 300 communities in Northern Wisconsin that do not have high school facilities. Northland academy was started in 1892 to meet this need. Fifteen years ago a collegiate course was added to the curriculum.

Northland had humble beginnings. On August 5, 1891, a group of people interested in education met at Pratt, now Grand View, in the heart of the forests and decided that an educational institution was necessary. A site on Chaquamegon Bay was selected and the academy was started the following fall. Rev. Mr. E. P. Wheeler, Beloit, was one of the mainsprings back of the movement and one of the halls had been named in his honor.

This institution now has an attendance of about 160 students. Of this number about 100 are taking the academic courses, which upon graduation admit the students to other universities. There are 60 doing four-year college work.

Three large buildings grace the campus: Dill Hall is the girls' dormitory; Wheeler Hall is the main college building; Woods' Hall is the men's dormitory.

Settlers of Northern Wisconsin have little money to send their boys and girls away to school. It is 250 miles to the nearest down state college. The boys and girls must find work. Thirty students who have attended Northland academy or college are now at the University of Wisconsin completing their studies.

"The boys who come to Northland are not aiming at the highest positions in the world of affairs," said Jean A. Fortier, a Northland graduate, who is now attending the University of Wisconsin. "They have a deep idea of service. When they have completed their education they return to their home communities to become teachers and farmers. It needs the help of educated men to build up Northern Wisconsin. The students have the idea that their opportunities in the world, their chance to render service, is in the communities from which they came."

"How much money do you need to attend Northland?" Mr. Fortier was asked.

"The academy tuition is $30 a year and the college tuition is $35," he replied. "All that many have is the price of the railroad ticket. They earn the rest as they go along."

Many students find work on the 160-acre farm. A prize herd of cattle provides work for a number of the young men. The best methods of agriculture and dairying are taught. Some do janitor work in the halls, peel potatoes, work on the farm, dig ditches to drain the land, and others find work about the city.

"Save me some work," wrote a girl last summer. "I would like some kitchen work, helping with the dishes."

Most of the girls find work in the dining halls. All of the cooking is done by them. To be a member of the "dishpan brigade" is considered an honor.

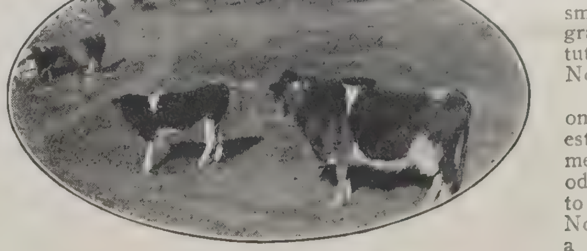
Aside from the labor in operating the college, two industries have been established. There is a printing plant that employs a dozen boys. They print the college annuals, the student publications and some of the commercial work of the city. There is also a cement block manufacturing plant, where the boys make blocks in winter. Two of the college buildings have been erected from this work and the contractors of Ashland buy the surplus product.

"Just what did you do to work your way through college?" one graduate was asked.

"I did all sorts of manual labor," came the reply and there was a gleam of pride in the answer. "I have done janitor work in all of the buildings, I have helped to make cement blocks, I worked on the farm, and for a while I did secretarial work for the city Y. M. C. A."

Students who come to Northland have a definite purpose in view. Defects in their early education make most of the students older than boys entering other universities. The college sophomore averages 22 years.

This letter from an Austrian immigrant tells the story of the yearning for an education among the young men and women of the north woods:



Above—Dill Hall, the Northland girls' dormitory.

Right—Student dairyman at Northland, holding a brand new calf.

Below—Scene on college farm where thoroughbred cattle are raised.

"Dear Sir:

"I thanking you in adwance will you be so kindly please to answer me and please to help me out to put my boy to your school he is seventeen years of age and was working to high school for two years and this spring I have come to a farm here where is no high school for him to go he is a good student and good worker and if he could not find a chance for himself to go to school in September I believe he get crazy. He want it to go to high school and I am to poor to pay his Expenses I have got six children and I have write to several places allready and to county Supt. and to State Supt. at Madison and he advise me to write to you. Now Dear Sir will you be so kindly please to help me out and take him to your college. I wish to have him finish his studies, he is willing to work for his board and room and I will help all I could do. please answer."

That young man is now at Northland and is making good.

One day President Brownell received this letter:

"Dear Mr. Professor President

I am intend to come. I have in this country three months been to school I want work Give me my Chance.

CHARLIE."

That was all. "Charlie" was given his chance and he was in a few years graduated with honors from the academy. Today he is a progressive American farmer on his own farm in Northern Minnesota.

One young man wrote: "I am a little lame, but I can work very hard."

He came and has demonstrated for two years that he can work very hard. This son of Russian immigrants is, in conjunction with his college work, becoming a skilled printer.

While the college is operated under the Congregational board, there is no bar to students of other faiths. All seem to be represented at Northland—all of the leading Protestant denominations and Catholics.

Some of the funds to operate "the college of the North," as it is called in the college literature, is obtained in the East. Last year a quartet of four students, Stacey Greene, Alfred Hornigold, Alden Smith and Jean Fortier, accompanied President J. D. Brownell on an eight weeks' tour of the East to enthuse New England in the work that the college is doing. President Brownell was in the East again last spring raising funds.

The college has not operated long enough to have a long list of graduates. Felix Gustafson, who attended the college and later the University of Wisconsin, has earned his doctor's degree and is an assistant in biology at Michigan University. Most of the students take up work in the communities of the North and many seem to believe they can render the best service in the teaching profession.

War depopulated the Northland College classes. There was not a boy in Northland, who was of age eligible to go into the service, who did not go. The college had no graduates during the war period and the institution claims a 100 per cent record for war service. Of the class of five, two girls and three boys, who graduated last year, all had been in the service.

Northland has only one-tenth the students to be found at Berea, but both work along the same lines. The problem of Northland is to turn the human material of undeveloped Northern Wisconsin into right channels of action. It tries to spread knowledge of how to live better in the pioneer communities, how to grow more crops, how to build better communities. Northland has adapted itself to the needs of the district it serves. If a boy or girl needs training to become a teacher in the district school, he or she receives it. And when the boy is ready he is given the collegiate work which will put him on the same educational plane as the graduate of a great college. Because Northland is but a poorly endowed college, with her main revenue the contributions of friends which have been solicited from time to time as the necessity arose, she has had to watch hundreds of these children who might be reached turn away from her gates.

For the poor families of Northern Wisconsin, Northland is rendering a service in the cause of education not unlike that which is given at Berea in Kentucky. In both institutions labor holds a place of honor.

"And the highway shall be there—"

This passage from Isaiah is the motto of the school. Among the pioneers of Northern Wisconsin, where within a great radius from the institution less than five per cent of the land is under cultivation, and where brawn and muscle, integrity and ingenuity, are needed in the next decades to turn this waste into smiling crops of alfalfa and grains, they call the institution "the college of the North."

The characteristic of the pioneers of which we are proudest is their self-reliance. They meet the conditions; ask no odds; accept a fighting chance to win. As a "college of the North," Northland is rendering a pioneer service.

What the Einstein Test Can and Cannot Prove

Concluded from page 9

Soldner, as Lenard noticed, made a slight mistake in his calculations in that he neglected the factor 2 in his formula. That was in the year 1801. In the year 1911 Einstein was overtaken by the same misfortune, that is, he also omitted the factor 2 in his formula." Through the courtesy of Dr. Lenard and Dr. Gehrcke, the author has all the evidence before him as he writes this article. This most unfortunate blunder, on the part of Einstein, in including the error of Soldner, was adroitly camouflaged in a subsequent article which appeared in the year 1915 (Berl. Akad. 1915, page 834). These astounding revelations cast a lurid light on the alleged discoveries of Einstein and enable us to understand the peculiar relations which exist between the computations.

Fifth. The formula of Einstein rests entirely upon mathematical speculations concerning an imaginary complex "Space-Time," conceptually spun out of fibers gathered from the fairyland of four-dimensional space. The program of Relativity outlined by Einstein is like a labyrinthian track which begins everywhere and after innumerable fantastic detours ends nowhere. Upon this bubble of the imagination rests a formula whose antecedents are doubtful. The specter of Soldner's work will forever darken the artificial radiance which has been massed around Einstein by his followers.

It is possible to calculate the deflection of light from simple assumptions which are grounded directly in physical facts. Why then are we forced to listen only to the siren song of Relativity to the exclusion of the voice of Common Sense?

Nowhere in the Einsteinian assumptions do we find a genuine dynamic element. It is all a matter of "geodesic" tracks artificially produced. Somehow the more naïve notion that if rays of light, in the vicinity of large matter groups, are bent, then real interaction between the two systems is the cause of the deflection. For Einstein, however, the deflection is a causeless event in a chimerical world of unsound mathematical speculation.

Sixth. The formulae of Soldner and Einstein are absolutely identical in form and meaning and almost identical in their use of letter symbols. Soldner's final formula which referred to the total angle of deflection was derived from an expression for only half of the angle. He failed to take account of this fact in his calculations. Herein, evidently, lies the source of the later confusion of Einstein.

Soldner and Einstein

THE numerator of Soldner's final formula consists of the product of *2K*, and *M;* and the denominator is composed of the product of *c* (to the second power) and *R*. The numerator of Einstein's formula also consists of the product of *2K* and *M*; whereas the denominator is composed of the product of *c* (to the second power) and the Greek letter "Delta." The meanings of all the corresponding letters are identical. Soldner's large *K* is identical in meaning with Einstein's small *k*, and Soldner's *R* has the same significance as Einstein's Greek letter "Delta."

Soldner, in his computations, failed to remember the fact that his formula referred to the entire angle of deflection. Consequently he gave the value 0.85" (second) for only half the angle, whereas it actually refers to the total angle. Einstein's formula, published in 1911, being the same as Soldner's, must give the same result. Subsequently, in the year 1916, a most extraordinary thing happened. In his article entitled "Grundlage der allgemeinenen Relativtatstheorie" (*Annalen Der Physik*, 1916, No. 7, page 822) Einstein gave the value 1.7" (second) as the value of the angle of deflection. Again we have the pernicious factor 2 in evidence because 1.7" (second) is twice 0.85" (second). I will refrain from pronouncing judgment, leaving the reader free to draw his own conclusions from the undeniable evidence here presented.

It is interesting to recall that the Sobral and Principe tests of May 29, 1919, gave 1.98" (second) and 1.61" (second), respectively. The average of these observations is 1.8" (second), whereas, according to the Newtonian theory of gravitation the amount is 0.85" (second).

Seventh. It is a well-known fact that Einstein, in the year 1919, stated positively that there is no ether. In his lecture at the University of Leiden, May 5, 1920, he modified this statement by first assigning the rôle played by the ether to this new conceptual creation. The tangible background for a genuine mechanical process is entirely missing, however, in this conceptual Space-Ether. Light is a real physical phenomenon and cannot be satisfactorily explained without assuming physical interaction between actual physical elementals of some definable type. The writer antedates Einstein in the contention that there is no ether. In his lecture before the American Electrochemical Society (Philadelphia, 1902) he pointed out the self-contradictory nature of the old ether hypothesis. Perhaps the most exhaustive criticism of the ether hypothesis which has ever been published appeared in the writer's work, "Scientific Theism Versus Materialism, The Space-Time Potential" (1920). Since the year 1902, I have regarded Space as a universal principle of mediation in physical phenomenon. Einstein entertains the essence of this same idea in his Leiden lecture but errs in his expressed hope that the mechanism of light can be explained solely upon this basis. Einstein's claim of priority cannot be substantiated in view of the writer's 1902 lecture. Einstein has failed utterly in providing a mechanical model for the physical changes involved in the production and transmission of light. The writer, in his work referred to above, outlined the possibilities of primordial neutral matter interacting with active matter in the transmission of light and electromagnetic phenomena. The eminent American astronomer, Dr. T. J. J. See, in his remarkable work entitled "New Theory of the Aether" (1920), has, with rare skill, presented a somewhat similar view of a corpuscular medium. Many of the most eminent physicists of Europe and notably Professor P. Lenard, of Heidelberg, Dr. E. Gehrcke, Dr. H. Fricke, of Berlin, Dr. Sten Lothigius, secretary of the Swedish Physical Society, Stockholm, Sweden, Professor Edouard Guillaume, of Berne, Switzerland, Professor Stjepan Mohorovicic, of Zagreb, Jugo-Slavia, and Dr. J. Comas Sola, of Barcelona, Spain, have protested vigorously against Einstein's attempts to account for the phenomenon of light by means of the Space principle only. We cannot get away from the necessity of something tangible in Space which may serve as the real physical conveyor or transmitter of that manifestation which we call light.

If the recent observations fail to confirm Einstein's speculations then a serious blow will have been delivered against his doctrine of Relativity. At present, about all that he can justly claim is that the formula which he has succeeded in connecting with his name gives results which apparently conform with one set of observations (May 29, 1919). The fantastic theory upon which it is based, however, has little, if anything, in common with actual demonstrable facts. If the results of this latest test should happen to conform with the calculations of Einstein that fact cannot be considered as conclusively significant when weighed against the enormous improbability of his speculative foundation. Moreover, this matter of the deflection of light constitutes only one member in his structure. We cannot pronounce the entire Einsteinian Theory correct if merely one member of the structure is found to be sound. It must be shown that every feature of his theory is correct. Unfortunately for Einstein, however, the collapse of one member will cause the destruction of his entire edifice. This he has already admitted. Agreement of the observations of September 21 with Einstein's predictions can only give him temporary comfort because the germs of inconsistency will eventually bring about the total destruction of his artificially vitalized theory.

Sympathy Propaganda and Emigration Facts

Concluded from page 10

they are at liberty to emigrate or not. Otherwise how can one explain the unvarying frequency of inadmissibility of "free" emigrants at point of departure or the admissibility of anxious emigrants who are not at liberty to leave their own country?

One country especially encourages the frequent return of expatriates that they may be reminded of their nationality, and since it represents the second largest group of aliens by nationality in this country it means that this agitation renders more difficult the process of Americanization. The country is Italy. Italy, moreover, is merely pioneering; other countries represented here are doing the same thing or are about to begin.

It would seem, if we wish to be inquisitive about it, that a country like Italy or Greece or Japan, each unable to attend to its nationals within the frontiers, has some ulterior motive in attempting to extend its paternalism overseas, especially when this paternalism is uncalled for and unnecessary. Aliens in the United States, to be frank, are beyond the need of paternalistic solicitude on the part of their governments. They are here, presumably, to better their economic condition and future, and the chances are that they are doing it.

European governments regard the American laws as exceeding good taste, to put it mildly. A prominent official used that phrase in a discussion with me, and he had discussed the problems with colleagues of other governments. By and large, they cannot see—barring individual cases—how immigration can be restricted or otherwise selected without "offending" the nationalities involved. Just as industry sometimes sells "run of the mill," so would European governments release emigration.

Crisscrossed with emigration are the more or less personal interests of the officials involved in the administration of the laws, to say nothing of the financial and other interests of various organizations interested in the problem. Influence, favoritism, expediency—these are the three cardinal rules by which emigration is urged or restricted, as the case may be.

But, perhaps, most important of all is another phase that has to do with man-power, that so far has not been hinted at in connection with expatriation, and that has to do with military service. This, not in the sense of yesteryear, when governments required able-bodied men of military age to do their duty under the colors, because said governments are less strict about retaining the younger male element in its late teens or early twenties than it is about losing its grasp over men who have seen service in or during the war.

And herein enters the gloomiest color of the picture. At the time that man power should be measured in terms of reconstruction, not only in Europe, but wherever such man power could be absorbed with profit by all concerned, government officials are crossing their fingers. These tried men are needed in Europe. They are needed—for what?

They are not under arms, they have done their time, so to speak, and yet they are looked upon lovingly, tenderly, reassuringly. They are wanted because war clouds have not been dissipated. With probably two exceptions, no country actually wishes to engage in another war, but if another war begins, no matter how local or how apparently inconsequential, it will witness the partial or complete mobilization of about every military power in Europe. And by that is meant every power, England included.

Trouble in the Air

THUS European governments, each in its way, with much trouble or with little difficulty, have managed to plod along under economic difficulties, and by various means have bridged the chasm of actual want. They have done it so well that it should be considered a marvel, except for the secret purpose that has dictated it. Said governments have suffered the flower of their male population—their productive population—to live from hand to mouth, without a future, without a thought for the morrow, with no definite policy toward national reconstruction, for the sake of having it near in case of emergency.

The worst of it is that the emergency is not only expected but that it is likely to come at any time. The Turkish-British snarl is a mere breeze. The serious part is yet to come. Some startling realignments will be seen when that moment arrives.

This surcharged atmosphere of impending trouble may be felt anywhere in Europe. It is miasmatic. The newspapers speak of national rights and of patriotism, but generally the official organs play upon masked declarations.

Enough of the cry that Europe is in the throes of disaster.

Europe is Europe, little differing from the Europe of 10 years ago, except in so far as the war changed fashions, just as it did in the United States. If Europe will go to work, the kind of work that must be done, emigration as a problem will take last place. But unfortunately for Europeans, the work that they don't want to do in their own countries is the sort of work that alone is available in North America.

Europe needs virtually nothing from the United States, under present circumstances, and the reiteration that Europe is lost if the "United States does not go to her rescue" is sheer nonsense and unmitigated propaganda.

Across the Campus of Indiana

The campus of Indiana University is ranked by artists among the three finest natural sites of educational institutions in the United States. The others are Cornell and Wisconsin.

Ocean Voyages for Crippled Slum Children

Boston Floating Hospital Gives Unfortunates Daily Health Trips

THIS is the story of the Boston Floating Hospital, the only institution of its kind. True, New York City has a floating hospital for children, a converted barge, which is towed down the harbor loaded with sick babies and older children from the slums, to give them a breath of the salt sea air. But Boston has the only especially built and fully equipped hospital ship, owned and operated by an organized charity, for purposes similar to those of the New York barge hospital.

It is a model, too, of what a mercy ship should be. There are two spacious decks, the upper devoted to two large main wards fitted with cribs for sick babies and two smaller wards, one on the after deck and one on the forward deck.

It is a wonderful institution, too. When you see 150 different babies getting 150 different kinds of food, each prepared by the most careful and solicitous of cooks, trained to this sort of work, and administered by trained nurses under the watchful eye of physicians who have diagnosed each little case, you marvel. A hospital to the smallest detail, complete in equipment, even to telephone connection with uptown phones up to the moment the ship leaves the dock. Full of sympathy and kindliness and cheer, from the chief engineer to the newest interne or the steward's boy and the deckhand—for there is a complete crew, as well as a complete hospital staff, aboard all through the summer and early fall—as long as the hot weather lasts.

It is a hospital with every nook and corner of the boat utilized; a hospital that steams down the harbor under its own power, with a fine set of twin engines, then anchors and comes back in the afternoon only to make another trip at night and, remaining at anchor all night, to come back at daybreak and repeat its daily performances of mercy.

To see the little stunted babies and pathetic looking sick toddlers, some of the former in tiny hammocks fastened to the sides of the crib, with abdominal bandages and little socks fastened to their legs from the sides of the crib to keep them from moving and injuring themselves in restless fever and pain, is a sight to make the heart ache. And then to watch them improve from day to day—some even as soon as the salt air begins to blow gently over them—is a wonderful experience.

The fresh air that they get away from the hot, crowded slums is one element that contributes toward their regaining health. Many of the children who are simply ailing grow better untreated after a few weeks out on the vessel's open decks.

The work extends beyond the decks of the vessel. For every tiny form stretched on an immaculate white cot there is an on-shore nurse seeking in its home for the cause of sickness and trying to arrange for future health. Besides the hospital staff, a chemist is constantly studying and working out formulae for the preservation of infant life.

The Boston Floating Hospital at her pier.

Aside from the cases of infant disease and malnutrition, combined with bad air and the handicaps of hot weather, there is the type of cases in which the patient's condition is due to improper food. Strange as it may seem, with all that has been written, spoken and taught about the proper food to eat, for both old and young, there are still many people who cannot see the difference between feeding a baby six months old on fresh milk, and on watermelon rind. The idea seems to be—give him what he wants. A baby generally wants what it sees, and will make a try at anything. And watermelon rind was never good, even for grown folks. So that by the time he has been given a taste of everything the family has to eat, he is ready for medical treatment. This type of patient, coming from districts that are overcrowded with people who haven't the slightest idea of how to care properly for their own health, to say nothing of a baby's, form a respectable percentage of the cases brought to the Floating Hospital.

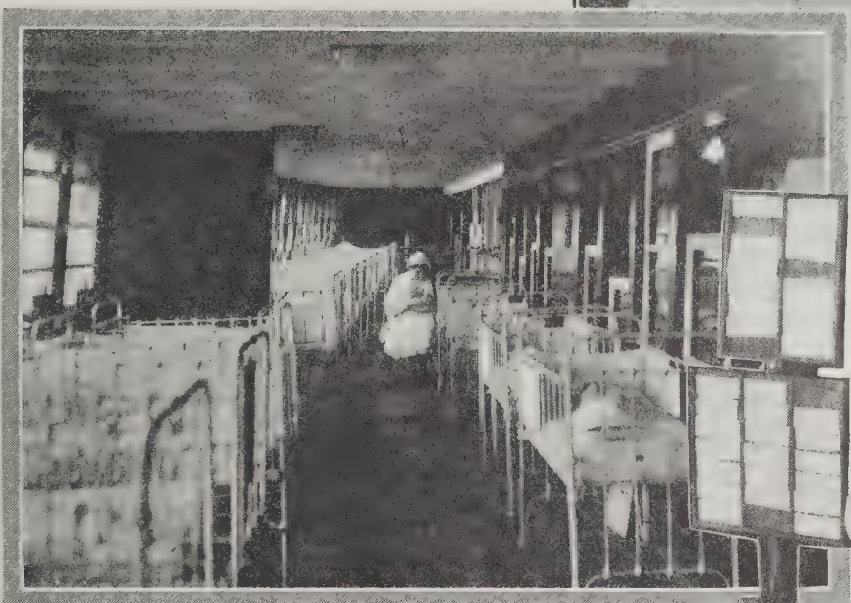
The day-patients are in a much less serious condition than the permanent cases, which are kept on board day and night until they are in a condition to be taken ashore.

Each patient is accompanied by his mother, who is permitted also to bring another child under five years of age, in good health. The patients are carried on the open upper deck, each in a separate crib. Here, under supervision and with such nursing attendance as the physicians may direct, the mother may care for her own child. Nourishment is administered to these babies by the nurses in accordance with the staff physicians' formulae. At noon a hearty lunch is served to the mothers and their well children in a large dining room on the lower deck. Most of the mothers bring along with them packages of lunch, but they are required to deposit these in a basket as they come aboard, and are not allowed to use them. The packages are checked and returned when they leave the boat.

Every precaution is taken to guard against infectious diseases, although each case is supposed to have been recommended to the hospital by a physician. Many cases, however, come without previous notice, so, on the dock, prior to leaving for the anchorage, the staff establishes a desk with a nurse to tabulate, a physician to make the necessary examinations, and such interpreters as can be secured for examining orally those mothers who cannot speak English. All necessary information as to home environment is added for use of the on-shore nurse as social worker.

The permanent patients are placed in the various inclosed wards which occupy the main deck and are cared for day and night by doctors and nurses. Practically all the permanent cases are serious, and the nursing staff has therefore to be very large—an average of one nurse for every four babies. So serious do most of these cases seem to the visitor that it is difficult to realize that the total death rate of the hospital for the season of 1915, for example, was but four and six-tenths per cent. The on-shore department follows up cases that are handled during the summer, visiting the children's homes to see that they are receiving proper care during the fall, winter and spring.

Being primarily a summer hospital, the institution deals largely with acute summer upsets in infants, the hospital's annual report showing by far the largest number of admissions to be due to gastronomic disorders. In connection with this phase of the work, the hospital is carrying on a series of special investigations in metabolism of an importance that can hardly be overestimated.



(C) Boston Photo News Co.
Above—A snapshot of the patients, their nurses and the "little mothers" on the day deck. At the left, one of the main wards, with some of the permanent patients in cribs.

The hospital makes a practical application of the most advanced methods of infant feeding. Every patient placed on an individual formula has this modified from time to time according to the indications recorded on the exhaustive clinical record kept by the nurses for every patient. And in this connection one of the most interesting departments of the vessel is the diet laboratory. Here the various milks, cereals and other diluents are kept in elevated containers from which they are drawn as required by each formula. Only one feeding is prepared at a time, the dietitian filling each formula as the baby requires nourishment. This laboratory is fully equipped for steam sterilization, and this requirement is rigidly adhered to.

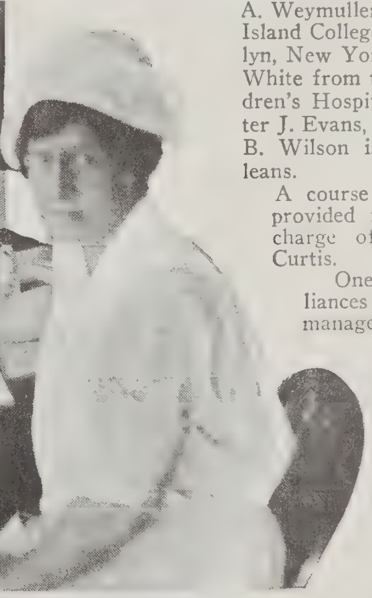
Each patient has a number, which is repeated on his formula, and this number goes on his order blank, which is filled out by a physician with the necessary changes from time to time. This order comes into the food laboratory and when the bottle is delivered to the attending nurse, the order is fastened to the bottle.

This is one of the activities that has grown up. There are on hand such specialists as an otologist, pathologist, stomatologist and bacteriological director, a chemist and two assistants, as well as several surgeons.

In the on-shore department, besides, are included eight physicians, all men of the highest standing in their profession. Dr. Charles A. Weymuller is from the Long Island College Hospital, Brooklyn, New York; Dr. Harvey L. White from the St. Louis Children's Hospital, as is Dr. Lester J. Evans, while Dr. Thomas B. Wilson is from New Orleans.

A course of instruction is provided for nurses, under charge of Miss Anna L. Curtis.

One of the great reliances that the hospital management has is the "little mothers," as they are called, the young girls who frequently come in charge of a sick baby when the mother is unable to come. These and other little girls who are attending school, are taught how to care for the babies and told what they should be fed; what should be done when they are slightly ailing and what sanitary conditions mean. They are the one hope where the parents are ignorant and obstinate. They frequently can influence the older people to follow out instructions, and convince them by translating what they have learned, when an older person can get no results. They remember what they are taught, and gradually educate their parents to better standards of health.



Preparing the nurse's record.

(C) Boston Photo News Co.
Children from the slums waiting for the late arrivals.

The Boston Floating Hospital was started 25 years ago, by Rufus B. Tobey, of Boston, who raised a sum to finance three harbor trips for ailing children in the congested tenement districts. With volunteer Sunday school workers they were carried out in increasing numbers each summer. An old barge, the *Clifford,* converted from a Penobscot picnic boat, was chartered for the work. Since then, day by day, there has been activity and progress. A nurse and a doctor began to make the trips with the sick, and the corps of nurses grew and the number of children taken on the trips increased until the old barge was outgrown. Finally came the present great hospital ship, with a capacity of 250 patients and their attending mothers. George C. Lee, a prominent banker, became treasurer and G. Loring Briggs became the manager, continuing to the present time. The scope of the work was extended, the educational field broadened and standards raised with the new ship and complete equipment, which is constantly kept up to date. The volunteer staff of physicians increased, until some of the most famous doctors in the world were on the visiting and daily staff, together with internes from leading medical schools.

Terrifying Mars—the Inventor's Mad Dream

The Never-ending Effort to Destroy War by Making Its Engines More Horrible

By T. M. VESEY

AMONG the many fallacies upon which is based the curiously contradictory doctrine that "if you want peace prepare for war," not the least mischievous has always been the inventor's daydream of creating an instrument of death so tremendous and awe-inspiring that the bare contemplation of its use against mankind would cause an amazed universe to recoil in utter horror. Hotchkiss, Nordenfeldt, Gatling, Maxim, Lewis, Mills and a hundred others have all, in greater or less degree, been victims of this obsession. All have made humanitarian claims for their inventions, and to date none of the claims have been proved to be other than woefully unsound.

All human experience would seem to indicate that this daydream is destined to remain permanently in its legitimate realm, the clouds. The broad aspect of the matter is this: that whatever else the history of war teaches, it assuredly makes patent the fact that the invention, development and preservation of engines for wholesale destruction encourages the ultimate use of them. More, it renders their eventual use apparently necessary. If Jones, conceiving himself to have been injured by Robinson, vows he will have the latter's blood for it, and, the matter coming to Robinson's ears, that ultra-prudent gentleman endeavors to insure his immunity by taking his walks with a shotgun over his shoulder, it must be fairly evident that he is only safe until such time as Jones, likewise, acquires a shotgun. After this, neither of them would be recommendable as an insurance risk; and a very short time finds them both actively engaged trying to bore holes in one another from selected coigns of vantage.

Most naval authorities now regard the submarine as a *sine qua non* of modern warfare. Similarly, army experts believe that poison gas has come to stay, despite that it has once again been banned—for the experts have not forgotten that it was banned long ago, and subsequently used as a matter of course.

The Case Against Gases

THE various lethal compounds, technically known as battle gases, constitute one of the most efficacious instruments yet known to science for the destruction of life on land. And if we examine the case against them, as far as the last war exhibited it to us, it will be readily discernible that awful possibilities for widespread destruction were barely missed—and by oversight, be it noted, not by design. The contention of the advocates of gas warfare was (and still is, for that matter) that it was no greater crime against humanity to asphyxiate an enemy than to blow him into inch pieces with high explosive, or to drill him as full of holes as a colander with machine-gun bullets and shrapnel balls; and this, on the mere face of it, seems to be fairly sound—as far as arguments for killing anybody can be said to be "sound."

The real defect, in this instance, lies in the circumstance that the numerical possibilities of destruction by gas are inconceivable, while with explosives, the action of which is necessarily localized to some extent, the possible results are not entirely beyond computation. But there was an alternative hypothesis. Some "experts" frankly admitted the atrocity of the thing, asserting that the realization of this feature would result in a rapid termination of the war, thus insuring a lower aggregate total of deaths than would otherwise be the case. This, of course, is again the inventor's daydream. One weak point in it is that it is based upon the illusion as to the possibility of winning a war by destroying a large percentage of the enemy with such startling rapidity that the terrified survivors will be intimidated into instant submission.

There is no evidence that any of the belligerents intended at the commencement of the war to bring asphyxiating compounds to the aid of their arms. It is, indeed, practically certain that the Germans, who were the first to decide to use gas, did not make this decision until some months after the opening of hostilities. But having once made it, they hurried forward their preparations for the manufacture of the gas—and they did this in so ill-conceived and haphazard a fashion that the first consignment to the western front (the chlorine cloud directed against the French Colonials and the Canadians on the twenty-second of April, 1915, in the Ypres Salient) was emitted long before the possibilities of gas as a weapon were sufficiently recognized, either by chemists or military commanders, to render the use of it highly effective, much less decisive.

This haste on the part of the Central Powers was possibly due to the not unnatural fear that, having made the descent of Avernus themselves—and with such facility—their enemies would be likely to make it too: perhaps even had already made it and might at any moment discharge rolling clouds of death against the soldiers of the Fatherland. Or—and this is not improbable either—they feared that preparations extending over a much greater period could not continue to be kept sufficiently secret, and that the object in view, that is, the wiping out, wholesale, of Allied troops, might be defeated owing to the latter's being forewarned and, therefore, forearmed. But whatever the reason for the grossly inadequate preparation prior to this initial gas attack, the fact remains that they permitted practice to outstrip theory.

The result of this error of judgment was that gas warfare was given time and opportunity to develop more or less in the light of day, just as machine-gun fire was. The latter, for example, which at the beginning of the war was so crude in its action as to be scarcely more effective than the combined rapid rifle fire of a company of well-trained infantry, developed so enormously under the guidance of experts that, toward the close of the campaign, properly co-ordinated machine-gun fire, with enfilade, direct, overhead, cross and liaison action, was so destructive as to render the spaces it covered well-nigh impassable to attacking troops.

Now, had the German researches been pursued in secret until, say, March of 1918, the Allied forces could have been practically annihilated. Had the enemy only waited until the summer of '16 before letting their "Angel of death spread its wings on the blast" they could, without doubt, have gassed a path to the coast. As it was, their initial efforts were, in the light of after-developments, positively trumpery. And it was no great length of time before the Allied chemists were well able to beat the German ones at their own game. Both in the defensive and offensive branches of gas warfare the Entente quickly wrested the "honors" from the Central Powers. Progress (sic!) was rapid on both sides. Phosgene followed chlorine. It is less apparent, more subtle, in its action. The chlorine chokes its victim, and he dies, in agonies, from suffocation; while phosgene clogs the flow of his blood and death from heart failure ensues. Beautiful examples of humanitarian war preventives these! Both are a fruitful source of recurrent sickness in after life, where the initial dose did not immediately prove fatal—which means that there is a doom hanging, like a sword of Damocles, over the head of many an ex-soldier who was gassed—not severely, as he thought—during the war. Men are dying today from the effects of it.

Di- and tri-phosgene were still more complicated and lethal variations of the basic gases. Dichlorethyl sulphide (the infamous "mustard-gas," or Yellow Cross) proved to be yet more lethal, and more underhand, in its action—and so on. At the close of the war we were making far more deadly Yellow Cross than the Germans were, and we had, ready to use, a still worse one when the Armistice was declared. Thus it went. Without entering into more detail, which is highly technical, as to the development of battle gases and their method of use, the fact is sufficiently established that this development was not secret.

Whither Does It Lead?

SURELY the illusion that such weapons as these can make war impossible should have been shattered by now. Gas is merely a typical example. With every other modern instrument of offense (or "defense") the argument can with equal facility be traced to its logical and inescapable conclusion—disaster to mankind. Whitehead invents a torpedo. It will blow so large a hole in a ship that the ill-fated vessel will sink in a few minutes, giving those on board no time in which to attempt to save themselves. Splendid! There will be no more naval warfare, for no people in the world will face certain destruction. Ninety-nine men out of a hundred will take the fighting chance, and take it with a smile; but not one in a thousand will face the grim certainty. Thus argue the advocates. But what actually happens? This: another mechanical genius comes along and exhibits a net he has invented, which, flung around a battleship, will enmesh the deadly torpedo and render it as innocuous as a ripe banana. Better still! The nets are bought (with the public money, but this merely by the way) and once again we congratulate ourselves. The torpedo net likewise precludes the possibility of war, by taking the sting out of the torpedo. Obviously it is of no use fighting if you cannot damage your opponent. That is the theory. But wait. The next torpedo appears on the scene with a most useful accessory attached to it, in the shape of an ingenious cutting machine, that will shear its way through the protecting net as easily as though the steel meshes were made of stuff as flimsy as that from which a spider's web is fashioned. Magnificent! Again wars and rumors of wars fade into the distance—to the vanishing point, in fact—for the enemy can once again be destroyed with thoroughness and dispatch.

These are the gems of wisdom frequently offered by the advocates of "peace with a gun in your hand." And so the game goes—the game that nobody can ever win. Whither does it lead?

Official Apathy Deprives People of Old Masters

Concluded from page 7

portraits of the signers of the Declaration stored in a corner with a lot of rubbish.

Those paintings formed the nucleus for the present unmatchable collection. Seven more of the original group were found in Hartford and New Haven. Heirs of the subjects produced others. As a result of the efforts of the commission, portraits were obtained of all but 10 of the signers, and it was proved that none of the 10 ever sat for a likeness. The collection by that time contained examples of the work of the two Peales and works by James Sharpless, Benjamin West, Gilbert Stuart, Robert Edge Pine, Thomas Sully, Allan Ramsay, Bass Otis, George and James R. Lambdin, E. D. Marchant, George Polk, E. L. Henry, George Etter, B. T. Welch; the famous full-length wood carving of George Washington executed by William Rush, and works by other celebrities of noted Revolutionary characters.

All the quaint chairs originally used by the signers were recovered. The commission then set about the task of restoration. When the Centennial Exposition was ended, however, nearly everybody lost interest and nothing was done until long after the city offices were moved into the new city hall. The second floor of the hall was closed for years and used as a storage house. Artists and historians protested until finally the Philadelphia Chapter of the American Institute of Architects became active. In 1913 Congress Hall was restored. It was found that a great deal of the previous restoration had been done along the interior decorating ideas of the restorers, with very little regard for the actual original arrangements.

An example of what is done with public collections, in which the whole art world has an interest, is furnished by what happened to the Wilstach collection, owned by the citizens of Philadelphia and exhibited in Memorial Hall, Fairmount Park. On order of the park commission, which controls the collection through a board of trustees, 167 of the paintings were sold. After the sale employes indicated that the pictures had not been sold. A large number had been sent to New York and when some of those interested checked up they found that all had not been returned. Finally 100 examples were traced to New York art dealers, where they were on sale at prices far above what was paid for them and more commensurate with their value.

It is by interlocking art management that the public has been denied access to the famous Independence Hall collection. Futile efforts have been made to interest the National Government to take over the shrine and its precious relics. Joseph Pennell has led a campaign to have established a Secretary of the Fine Arts in the President's Cabinet. There is no question that the record of indifference and inefficiency, that has marked the city control of the hall where the American Republic came into being, proves the need of some other form of management.

Terrific Fear of Germany Basis of French Policy

Whole Country Believes Defeated Nation Must Not Be Permitted to Recover

By PAUL TYNER

IT IS difficult for the American to be other than sympathetic with France. There is the saying that "every man has two countries: his own country and France." The late Tom Appleton, of Boston, uttered a *bon mot* which found general response when he said that "Good Americans go to Paris when they die." It is not merely that we cherish grateful memories of Lafayette and of France's substantial aid in our own struggle for independence. The *entente cordiale* depends on no merely historical associations. Much more it may be traced to a kinship of spirit. We are sister republics and there is much of French derivation in the Declaration of Independence. Since the close of the war especially, our Fourth of July is celebrated with éclat in all France and we are far from being cold to the anniversary of the storming of the Bastille. We have held in high regard French culture. Molière and Racine, Corneille, Victor Hugo and Alexandre Dumas, *pére et fils,* are mental nutriment of both American and French youth. Americans thrill at Napoleon's name. Joan of Arc is almost as much American as French.

Whatever prejudices we may have in the dispute over the reparations problem are in favor of France and against Germany. We are inclined to feel hurt at the suggestion that France's magnificent sacrifices, her heroism and sufferings can be ignored or minimized by Americans. All the same, our plain common sense forbids us to be blind to the facts involved. With the cooling down of war frenzy, we do not take it for granted that the Peace Pact of Versailles is to be swallowed whole. Even "punitive damages" must find some basis in reason and cold facts. So before allowing our enthusiasm for our French friends to carry us away we desire to examine the account and go over the figures. We are not so particularly solicitous about the Germans, but we do not approve of the tactics of the boy who, when remonstrated with for beating a dead dog with a club, replied: "I know he's dead, but darn him, I want to meller him!"

Say Germany Can Pay

WHAT is the French attitude? Simply that the sum total of the indemnity of 133 billion gold marks to be exacted from Germany, is less rather than more than the total of France's losses occasioned by German invasion of her territory and that of Belgium. A recent writer in the *Revue de Deux Mondes,* sets out to demonstrate the further claim that Germany is abundantly able to pay the 133 billions and more.

During the last year or so, M. Poincaré and supporters in Parliament and the press have abandoned emphasis on mercenary and commonplace considerations of the economists. The French attitude and the French point of view is avowedly not one of common sense "business" adjustment of the debt but an appeal to *national safety,* honor and greatness. Not that France may obtain just payment of the milliards from Germany, but that France shall through all coming time be absolutely insured against the peril of a repetition of German aggression, it is demanded that the "sanctions" of the Versailles Treaty shall be enforced to the letter. It is insisted that German industrial and commercial prosperity is a terrific menace to France. That German workmen should today be busily employed in production and hard at work is hotly resented as a plain threat against the French frontiers. The smoke issuing from German factory chimneys is regarded almost as gravely threatening to France—to the very life of the nation—as if it were issuing from the mouths of Krupp guns pointed at Paris.

In a word, the entire French nation seems to be utterly hypnotized by fear of a reconstructed and economically strong and stable Germany. It is this terrific national fear that is at the bottom of French policy as framed and directed by Raymond Poincaré.

This is a fair statement of French national policy and, what is more, of French national feeling.

It may all sound childish to many on the other side of the Atlantic. But this amazing state of panic is a very stern and unescapable reality to the French. Indeed, it is difficult for American friends of France breathing its atmosphere to quite avoid the contagion of fear of German aggression that pervades the very air.

Another international conference on which great hopes were placed ended in a fiasco. The Hague meeting, like that at Genoa and that at Cannes before it, proved abortive. Its failure was the logical outcome of the failure of the Paris Conference of International Bankers which, under J. P. Morgan's leadership, seemed to promise so much in the direction of giving an actual start to the long-delayed task of economic re-establishment in Europe.

Not So Courteous as Once

THE war, it has been remarked, is probably responsible for a marked deterioration of amiability and good manners in many of the belligerent nations. Precisely because of the fame of French politeness, any experience of rudeness, and especially of rudeness directed toward Americans, comes with something of a shock. But it is nothing uncommon for Americans—even American women—to be unceremoniously elbowed and bumped against by Frenchmen of the higher as of the lower rank on the sidewalks, at crossings, in the underground stations, or in getting on or off auto busses and street cars. The Frenchman's tip to a waiter in a restaurant or café, or his *pourboire* to a taxi driver or railway porter, is received at least with a murmured *"merci monsieur";* but it often happens that when an American bestows a tip twice as big, he is indignantly told that it is not enough. At times the tippee surlily turns his back without a word, or is heard remarking to another waiter in an audible *sotto voce* that these rich Americans expect to be treated like kings, but are too mean to let go of a few sous! Yet it should be noted that Americans who know their Paris and who frequent the more modest establishments, say those of the Latin Quarter, note no lack of the ancient politeness and the ancient human *camaraderie.* And the Paris policeman is always polite and patient, invariably touching his hat and saying "Monsieur," or "Madame" when addressed and showing kindly readiness in imparting directions to the wayfarer.

Truly, it is far from an uncommon experience to have a Frenchman of whom the visiting American happens to ask a direction lift his hat and insist on accompanying the stranger perhaps half a mile.

At heart, the French people love the Americans quite as strongly as the Americans love the French, although they take different ways of showing their affection. After all, we Americans started the revolutionary republican movement. The men and the events of 1776 in America had considerable influence on the course of events that led to the French upheaval of 13 years later. Thomas Paine wrote the French Bill of Rights only after he had sharpened his pen on "The Crisis" and other pamphlets to which Washington attributed a share in the success of the cause of American independence not second to that due his own sword. In fact, the attitude shown by the French in the matter of their country's money debt to the United States may be taken as rising from a sort of family affection. One does not entirely reconcile oneself to the idea of having to pay back a loan from one's own sister or brother, especially if the money has been spent in a common cause.

Unfortunately for the early and satisfactory solution of the whole big problem of economic reconstruction in Europe, it is difficult to reconcile French emotionalism and Anglo-Saxon common sense. Just now this solution seems likely to be further delayed and complicated by the rather insidious and effective propaganda that is being conducted under official and semi-official auspices for the extension of France's emotional attitude to America. There have been in Paris just now 87 members of a so-called "Good Will Delegation" of self-supporting American women chosen by newspaper ballot in about as many centers in our West and Middle West. They were fêted and taken about and impressed at every possible point not simply with the beauty of Paris and the greatness of the French, but with the devilishness of the Germans as displayed in the devastated regions and along the old battle fronts. Good will between French and Americans is all right. But does it imply an intensification of ill will toward a beaten foe?

Said one of these young teachers to me: "When I think of what the kaiser has done, I think he ought to be set on a cake of ice and towed out to the ocean." Another cut in: "That would not be half bad enough for him; he should be burned alive or boiled in oil." And they meant it!

The Devastated Regions

I WAS reminded of what a well-known American I met at Oberammergau said when something was said in appreciation of German hospitality and kindliness. "I find myself almost ready to forgive the Germans," he declared, "until I remember the devastated regions in France!" And his gentle wife and mother at the table gave this sentiment their full approval. The French must certainly be given full credit for keen perception of the value of suggestion. So the devastated regions seem likely to serve the militarists here for a long time to come as "the bloody shirt" served the radical Republicans and would-be crushers of the South after our Civil War. This consideration may throw some light on the mystery of France's refusal of the offer made by the German trades unions three years ago to rebuild the ruined districts with German labor and material. If the offer had been accepted, the 40,000 American tourists who are this summer having their souls harrowed by gazing on these scenes of ruin, havoc and desolation, might not think so badly of the Germans, while thinking no less of the French. There is, of course, the "economic" reason that such a rebuilding of the war-wrecked zone by German labor and material would have deprived French contractors of rich profits and French banking concerns of the profitable bond issues which they have floated for "reparations" purposes.

Paris, the Sham and the Real, of Post-War Days

Concluded from page 8

titude of French womanhood. If marriage is not brought to them, if circumstances do not permit them to meet single men at home or through friends, conventionally, they will advertise their celibacy.

While some of my friends were sitting at a table in the very front row of the Café de la Paix I took a long walk from the Place de la Concorde down the Rue de Rivoli until this became St. Antoine, turning at the Place de la Bastille until I reached the street that skirts the Seine, known as Quais of differing names. I turned back at Charenton. Those who know Paris know that this is quite a walk, especially when undertaken after 11 o'clock at night. It was dawn ere I entered my hotel in the Rue Cambon.

Rue de Rivoli was quite deserted and dark. From time to time a splash of illumination would meet the eye, usually from the door and window of a café. The virtually endless vista of archways of colonnades, with their many shadows and turnings, gave it an atmosphere of monastic gloom. It was not the scene that a tourist would care to pass his time in. Yet it was—and is—Paris. Here and there the wide avenue already revealed signs of the following morning's business activity.

I was thirsty, so I hied myself to *Au Barometre*—where coffee was sold for 20 centimes, or exactly 1 franc and 5 centimes less than the place I had just left at the corner of Place de l'Opéra. A few stragglers, recruited from a class of French provincials who seldom stray into the fashionable boulevards, remained. Here were two men playing dominoes; there a group of three were discussing French politics; near me a family consisting of pa, ma, a kid and a kiddie—you know what I mean, the kind that raise "young hopes"—was discussing food. *M. le proprietaire* was busy polishing the zinc water trough and looking with alert eye for the sign of another order.

What the marital status of the men in the other groups might be was conjectural. They might be brothers, sons, nephews with some household responsibility, and one or two might be orphans. But they were men of the earth, men who worked for a living, and were just now passing the time peaceably among themselves.

But to return to my walk. One could have stood in the semi-darkness of the square which once graced the most famous prison of Europe and which now bears its name, and drawing upon one's recollection of the French Revolution, have communed with the ghosts of those hordes that made so much history six generations ago. This, too, was Paris, far removed from the boulevards of light-hearted visitors.

The square itself hardly bears trace of any such upheaval as is recorded by history, but who knows whether the man on the corner beyond may not be a direct descendant of those restless and oppressed ancestors?

Then the Seine. It makes serpentine turns through the French capital. The cobbled quais are hard under the feet as they are under taxi-tires or steel-tired carts. Benches. A sign announcing races at Caen, "to encourage horse-breeding of medium quality," which means the breeding of medium-quality horses. An ancient bearded man, with a sack and two or three miscellaneous bundles, dozing or asleep. He is old but he is not a wreck; somehow the lineaments are sharp; he may have seen better days or he may have been most of his life a street waif, but the years have not misused him and he is still hale and hearty, even if he lacks a roof. Could he reveal a hectic life-tale or merely a drab one?

Cart after wagon after taxi—taxis often shoot along the quais on the way to the Gare de Lyon—and more signs of a new-born day, because it is now after one. A milk-cart, farther down some street cleaners, but they are sporadic outbursts of life. The city is yet asleep.

On the left I see a light in a doorway and I find a woman, about 42 years of age, sitting and sewing beneath the dim light. Probably the wife of the concierge—or his widow.

I manage to engage her in conversation with the pretext of asking for directions to the station. Does it not hurt her eyes to strain them so under so uncertain a light?

"Monsieur, what will you? It must be done. It costs much to live."

I realize that she is patching a pair of trousers belonging to a future man at present aged about seven to ten; size is no criterion.

That was Paris, too; and it is Paris, away from the beaten track of the outsiders.

These scenes repeat themselves; they become commonplace; they are commonplace. They are not set to music, not set to flags, not played up by varicolored incandescent bulbs, not set off by laughter and song. One hears even the silence, because it is the silence of a tired city after a day's hard work that soon after must do another day's hard work.

If one can only get to understand these persons—these families—which make up the bulk of the populations of the countries that seem not to have had enough of war, according to some of their muddling and meddling officials, war would become quite impossible, because those people—those real Parisians, in this case—think and live the same problems that are thought and lived by Americans, Germans, Russians, and Chinese.

One may disregard the garish side of Paris, which is a mere mask and a false measure of the city within.

BRIEFLY TOLD

The first gold to arrive in Canada since the signing of the Armistice has been received from New York. Formal announcement was made by the New York Trust Company that it had shipped $500,000 in gold to the Canadian Bank of Commerce.

More than 6,000,000 persons in the United states engage annually in hunting during the open season.

Up to September 16, Montreal elevators had unloaded 93,881,325 bushels of grain from lake vessels, and had at the same time loaded ocean vessels with 88,849,941 bushels, according to records of the Harbor Commissioners' office.

All cabinet ministers of the Manitoba government who took office recently are Scots, or of Scotch extraction, and they are Presbyterians.

A red cap at the Grand Central terminal in New York City was body servant to Lord Kitchener for a dozen years and was the head interpreter of the Roosevelt big game expedition to Africa. He is familiar with 13 languages and five African dialects.

Mustapha Kemal Pasha is the son of a Turkish father and Jewish mother. He is a blond, with piercing blue eyes. He wears a closely cropped, diminutive flaxen mustache.

Sir Auckland Geddes, British ambassador to the United States, speaking at a dinner in New York recently, stated, "America coming into the war as she did when she did, played a great rôle, a great part in ending the war. The man or woman who says otherwise is one of three things, ignorant, malicious or just a fool."

The Izaak Walton League has inaugurated in Chicago a monthly periodical, supported by contributions from scores of Izaak Walton chapters. No one connected with the publication receives pay and a half-dozen famous novelists are contributors. It is devoted to the preservation of angling, hunting and other outdoor sports.

More than 5,000,000 persons in the United States alone derive their incomes, in whole or in part, from "tips," or gratuities.

Lenin is reported to have said, "Our Communists are often mighty fine theorists, but they are no good as far as practical labor is concerned. Our worst enemy nowadays is the Communist-orator, who is put in high positions. We must do away with agitators and propagandists, who know how to break down, but who are unable to put something else in the place. These people are a hindrance to the proletariat."

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

The Hawaiian Civic Club, composed of leading Hawaiians, recently adopted a resolution in Honolulu denouncing "exhibitions given in Hawaii and the mainland under the name of the ancient Hawaiian hula, in costumes alleged to be typically Hawaiian, as being indecent parodies."

The air mail service has just completed 10 consecutive weeks of performance with no break in the regular schedule and no trips defaulted. During that period the mail airplanes flew an aggregate of 321,600 miles, carrying 13,200,000 letters at a rate of more than 100 miles an hour. When the airway between Chicago and Cheyenne, Wyoming, is lighted, mail will leave New York at 1 p. m. and will arrive in San Francisco by 3 p. m. the next day.

A transcontinental journey in Australia by rail from Perth to Brisbane involves five changes due to break in gauge. The distance is 3,480 miles with the greater part of the railway mileage constructed on the 3 feet, 6 inch gauge.

In Bulgaria, education is free and compulsory from the age of seven to fourteen. More than 700,000 students attend the schools of Bulgaria.

As a result of the serious depreciation of the mark in Germany, barter is replacing the use of money in various parts of that country. Agricultural schools at Triptis and Marksuhl have fixed the tuition for the winter term in rye instead of in money. Thuringians will pay 1½ zentners (hundredweights) for the semester, and non-residents of Thuringia two zentners. The power company at Auma has announced that it will gladly receive 10 eggs, three pounds of wheat flour or a quarter of a zentner of potatoes for each kilowatt hour of electricity consumed.

State roads and schools are to share in the receipts from the National Forests. Governors of 28 states have been notified that 25 per cent of the $3,421,531 received from the sale of timber, grazing permits, and other sources of national forest revenue for the last fiscal year will be distributed among them. Ten per cent of the total receipts is transferred to the Forest Service to construct roads and trails within the forests.

More than half of the sugar consumed in the United States comes from foreign sources.

The outstanding feature of the King immigration policy of Canada is the restriction of immigration to agriculturists, to encourage, first of all, the immigration of boys and girls in their "teens" from the British Isles, and to co-operate with provincial governments and the Canadian Colonization Association.

An extensive propaganda is being made in Russia in favor of growing Indian corn instead of rye and wheat, because it resists drought better than the latter grains.

Members of the Danish nobility, a count and his wife, recently hired out to a Saskatchewan farmer posing as laborers. They decided that to journey to Canada as a laborer and his wife would be a novelty, and so they came, traveling by a harvesters' excursion train to Regina from the East.

A new dam across the Blue Nile at Sennar, 150 miles above Khartum, will be built by a well-known British contracting firm. The dam will be more than two miles long and approximately 650 miles of drainage and irrigation canals will be constructed. The land so reclaimed will be used for the cultivation of cotton. When the work starts nearly 7,000 hands will be employed and it will take three years to complete the project.

When a child is absent from school in the Virgin Islands, without a proper excuse, the parents are fined 20 cents for each day's absence. They are also fined 10 cents every time a pupil is tardy.

Coal is plentiful in Skowhegan, Maine. This town established a municipal fuel yard several years ago, and at the end of each season a surplus of from 500 to 1,000 tons of coal is purchased, to guard against strikes or other emergencies. Consequently, there is plenty of coal to supply the needs of every householder.

Immediately on his election, the speaker of the British House of Commons is entitled to receive 2,000 ounces of plate, two hogsheads of claret, $5,000 equipment money and $500 a year for stationery.

CHRONICLER OF THE NEGLECTED TRUTH

A Sales Manager Said—"Work on Sundays"!

What American Business Men Say in Reply to Questioning; Shall Sunday Become "Agents' Day" in American Homes?

By ALBERT SIDNEY GREGG

R. J. STRITTMATTER is a very clever letter writer. As sales manager of the Apex Electrical Distributing Company, of Cleveland, he prepares a weekly sales letter, which is mailed to 9,000 dealers and agents engaged in selling household electrical appliances. This communication contains confidential information, and "ginger up" exhortations intended to increase the activities of the men in the field. In letter No. 87, dated May 20, 1922, Mr. Strittmatter urges his men to make Sunday calls at homes for the purpose of closing sales. His general argument is that Sunday is a good day for doing business, because the "man of the house" can generally be found at home at that time, and the salesman can deal with him directly in place of "selling" the wife first, and depending on her to "sell" the husband. In supporting this proposition Mr. Strittmatter says:

> "There are, without doubt, many who today are taking the Fourth Commandment too literally. Just a few days ago the manager of our Cleveland Rotarex Department remarked that one of his retail salesmen had closed 12 washer sales on the previous Sunday. Too many of us feel that Sunday was made to rest. Some misguided disciples of the blue laws would do away with Work of any kind on that day. But in this business, evenings and Sundays are the most valuable portions of the week to salesmen who attain big earning power."

Doing business on Sunday, if practiced generally, would lead to the invasion of thousands of homes on Sunday by agents with something to sell. The way to test a matter of this kind is to ask: "What would happen if everybody did it?" The answer is so apparent that it is not necessary to discuss it even to the extent of a single paragraph.

After reading Mr. Strittmatter's letter, the writer culled the choice paragraphs quoted, and submitted them, with three questions, to representative business men, who are active in the Chamber of Commerce of the United States.

THE QUESTIONS

1. Do you know of any other instances where concerns are advising their salesmen to do business on Sunday?

2. What is your opinion of the effect on society in general of a business policy which advocates or requires Sunday selling of any kind? Do you think Sunday business pays in the long run?

3. What is your definition of "necessary business" on Sunday?

Replies are herewith given from men engaged in widely differing lines in all sections of the country.

O. L. HARRISON,
Sales Manager, The Dayton Engineering Laboratories Company, Dayton, Ohio.

1. I do not know of any instances where concerns are advising their salesmen to do business on Sunday. This might apply to motor car dealers, when their salesmen took prospects for demonstration rides on Sunday afternoon.

2. An opinion, unless based on facts, is of absolutely no value. I have no definite information regarding Sunday business.

3. Necessary Sunday business consists of a sufficient amount of business to enable the entire community to be happy.

W. J. DEAN,
Nichols, Dean & Gregg, Iron, Steel and Hardware, St. Paul, Minnesota.

I am very much surprised at the contents of your letter. I know of no business, nor have I any friends engaged in any business, the prosperity of which is dependent on Sunday work.

We employ a large number of salesmen and as far as we are able to control them do not encourage any solicitation on Sunday. We believe the present-day indifference on the part of some people to the observance, at least in some respects, of Sunday will result in the breaking down of our institutions. We do not believe that Sunday business pays and if our prosperity were dependent on Sunday work we certainly would try something else.

We believe the only necessary Sunday business is such work as is done by the police department and other public works.

Of course, in a case of public necessity or anything of that nature we would be glad to open our place and put our entire force to work.

I have before me a copy of a letter written by President George B. Stewart, of the Auburn Theological Seminary, Auburn, New York, to the Honorable Bayard Henry, Philadelphia, relating to the railroad strike—the last paragraph of which reads as follows:

"A part of the indictment against the present tendency in this country is that we are all so crazy for peace, international and industrial peace, that we will surrender any principle and resort to any device to secure them. Peace is not a goal in itself. Any organization, or group, or country that seeks peace as an ultimate goal forgets that peace comes as a by-product and not as a direct result. What we must put as our goal is righteousness and fair dealing and then if peace comes we can be grateful, and if it does not come then let us accept the consequences without cowardice or shirking."

If the word "business" were substituted in several places for the word "peace" this paragraph would express our sentiments better than anything we know.

H. G. FRENCH,
Vice-President, The Procter & Gamble Company, Cincinnati, Ohio.

This company has always been quite definitely opposed to Sunday work and unless the exigency is very great we adhere strictly to this rule.

We would answer your three questions as follows:

1. We have no knowledge whatsoever on the subject.

2. In our opinion the effect on society in general of a business policy which advocates or requires Sunday selling is unwholesome. In the long run we think Sunday business in the sense you describe it is poor business and is not warranted from a business standpoint.

3. Our definition of "necessary Sunday business" is that caused by emergencies which cannot be foreseen and otherwise provided for.

F. C. DILLARD,
Head, Dillard, Smith, Maxey & Head, Attorneys at Law, Sherman, Texas.

1. I do not know of any instances where concerns are advising their salesmen to do business on Sunday.

2. I think the effect on society in general of a business policy which advocates or requires Sunday selling, generally, is bad. While I am by no means a Puritan, nor an advocate of the blue Sunday, I do think there should be paid a decent respect to the Sabbath day, not only out of regard to those who revere it as a holy day, but because I think, in addition, that the utter breaking down of all regard for the Sabbath—the treating of it as any other day in the week, or, worse still, as a gala day—tends very much to break down the morale of the community. I do not believe that Sunday business pays in the long run.

3. I answer this question indirectly. I have indicated above that I do not believe in a blue Sunday and that I do not believe in a gala Sunday. Sunday is the only day that many of the working class have for recreation, and I think that the art galleries and museums should be kept open on this day, and that there is nothing wrong in the indulgence of seemly recreation, but I do not believe it best to have Sunday baseball games, open theaters and picture shows, and things of this kind on the Sabbath day. As to the kind of business that should be done, this, in my judgment, should be confined to drug stores, restaurants, and places of that kind.

A. B. FARQUHAR,
A. B. Farquhar Company, Limited, Manufacturers of Farm Implements and Heavy Machinery, York, Pennsylvania.

1. I know of no instance where concerns are advising either to do or not to do business on Sunday.

2. My idea of doing business on Sunday is the same as that of the Savior, who gathered corn on Sunday and said the Sabbath was made for man and not man for the Sabbath. I thoroughly believe in a day of rest, and I should not like to see it commercialized. If a salesman has had plenty of rest, there is no objection whatever to his discussing business on Sunday with anyone who wishes to talk with him about it. I would not advocate regularly going out for business on Sunday. Of course, there is no objection to traveling on that day.

3. Necessary business on Sunday would be only business that could best be done on that day, meeting a party on that day that you could not meet on any other day. Railroad and street car service is, of course, a necessity on Sunday. To stop street car traffic on Sunday would be an injury to the health of the people and interfere with their church attendance. It is better for the people to have a day of rest, a cessation from activity, though I approve of Sunday walks, healthful games, such as golf, but do not approve of the Continental or wide-open Sabbath. I believe on the whole a quiet Sunday, with quiet pleasures, and church attendance, is better for all concerned. I do not think Sunday business would pay in the long run.

LOUIS GOLDSTEIN,
President and Treasurer, Louis Goldstein & Sons Company, Wholesale Distributors Dress Goods, Furnishings, Ready-to-Wear, Notions, New Orleans.

1. I know of no instance where salesmen are urged to do business on Sunday other than the one which you quote.

2. I should think a business policy advocating Sunday selling of any kind would mark a step backward and would not in any sense add to the general welfare of society.

3. My definition of "necessary business" on Sunday is rest, recreation and meditation.

W. B. HEINEMANN,
President, B. Heinemann Lumber Company, Wausau, Wisconsin.

This company does not make a practice of doing any Sunday work, and just rarely calls on any of its employes to do anything on Sunday. There are times, of course, when necessary repairs must be made around the plant to keep it going, and then there are conditions making it necessary occasionally to do some Sunday work caused by the elements, but aside from that it is not customary for any of our employes, aside from watchmen, firemen, and so on, to do any Sunday work.

ROGER W. BABSON,
Eminent Statistician, Wellesley Hills, Massachusetts.

1. No.
2. No, nor in the "short run."
3. Things that people want on Sunday, like milk, transportation, and so on. People don't want salesmen to call upon them on Sunday.

C. M. KERR,
President, The Farmers' Fire Insurance Company, of York, Pennsylvania.

1. I do not personally know that business concerns are advising their salesmen to do business on Sunday, but, as I travel very greatly myself, I know that many salesmen try to do business on Sunday if they find a customer who is willing to do business with them.

2. My personal opinion of the effect on society in general of a business policy of any concern that advocates selling of any kind on Sunday is that it is not the kind of policy that I could endorse or advocate. I do not believe that Sunday business pays nor do I believe that the business of any man who tries to operate continuously seven days in the week will prove a success. In the first place I believe public opinion by a large majority would be against Sunday work of this character and labor of any character needs at least one day of rest from work.

3. To draw a sharp line as to just what defines necessary business on Sunday would be very hard to do, as many of us would differ to a very great extent in our views. Necessary work on Sunday might be required sometimes, but the balance of the year it would be absolutely unnecessary. For the general good of mankind I am opposed to Sunday work and I believe it should be curtailed as much as possible.

MELVIN PATTISON,
Vice-President and General Manager, The Brown Hoisting Machinery Company, Cleveland, Ohio.

1. No.

2. The effect of Sunday work on society in general would be very bad. Every working person needs one day in the week for rest and recreation. I am sure that Sunday work does not pay, as a working person will do as much in six days with a day of rest as he will in seven without the day of rest.

3. Emergency cases only, but no continuous Sunday work week in and week out.

T. E. JACKSON,
Southwestern Manager, Pittsburgh Plate Glass Company, Dallas, Texas.

1. I have never heard of any concern actually soliciting business on Sunday.

2. In my opinion no permanent progress will be made by attempting to carry on business transactions on Sunday, and a concern that ignores the Sabbath not only works injury upon its own organization but may be responsible for more drastic legislation.

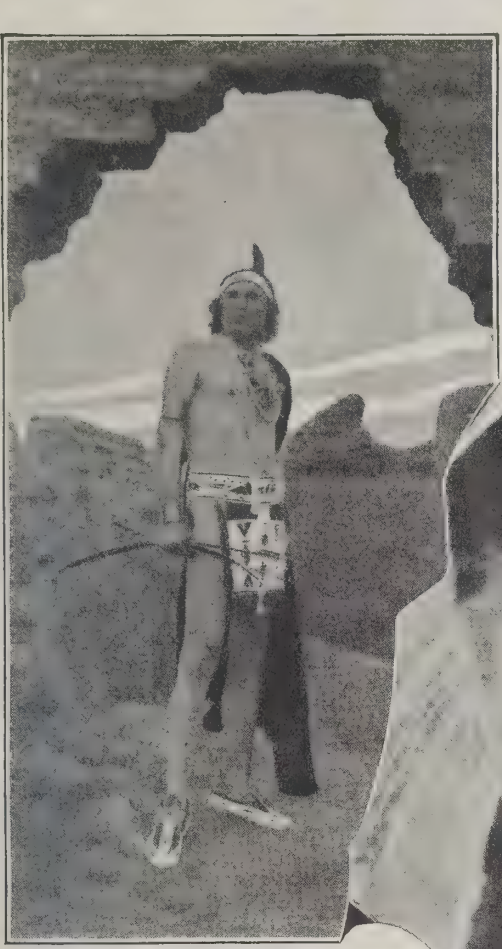
3. Under "necessary business" I would classify such commodities as may be required by the sick and for the operation of public utilities.

(*Concluded on page 14*)

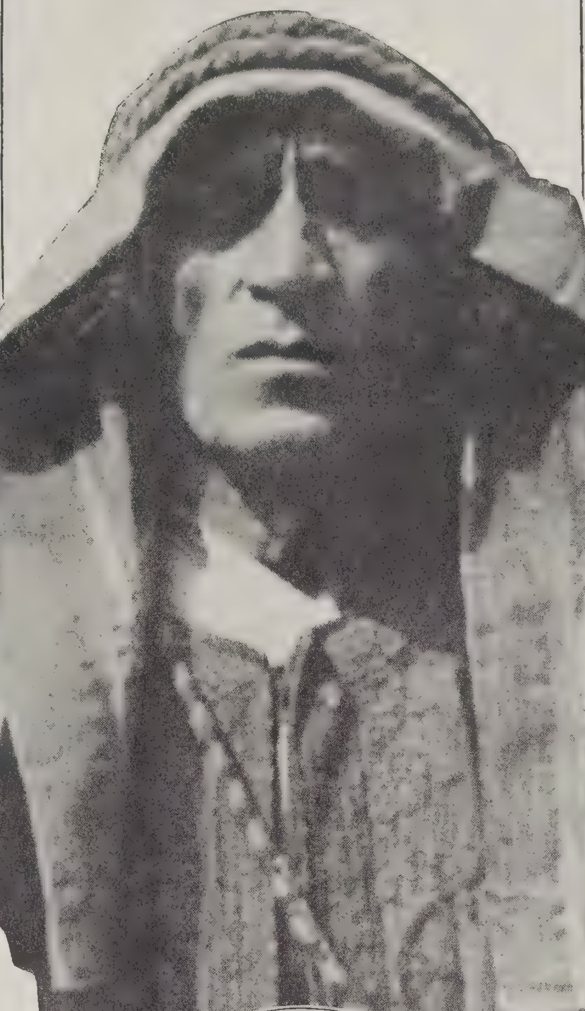
Antonio Corsi—the Man of a Thousand Faces

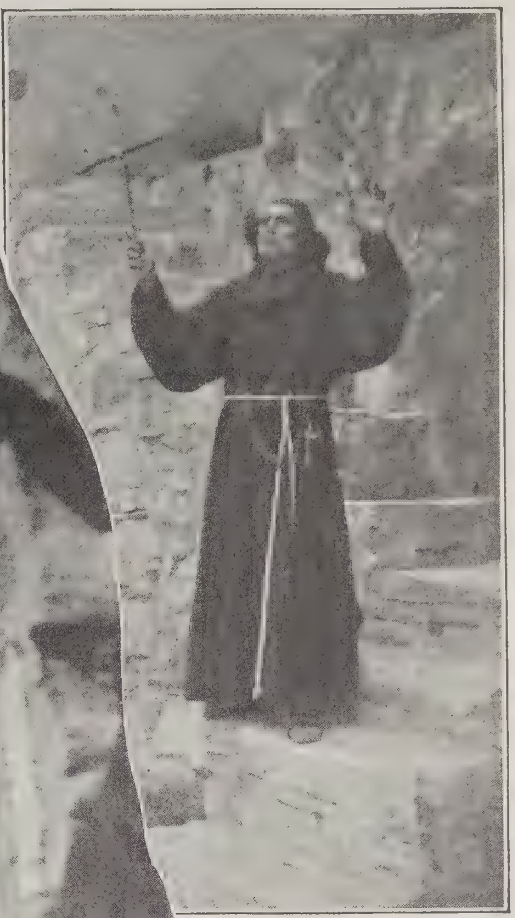
World's Most Famous Artist's Model Lives Simply in California Bungalow

By HARRY H. DUNN

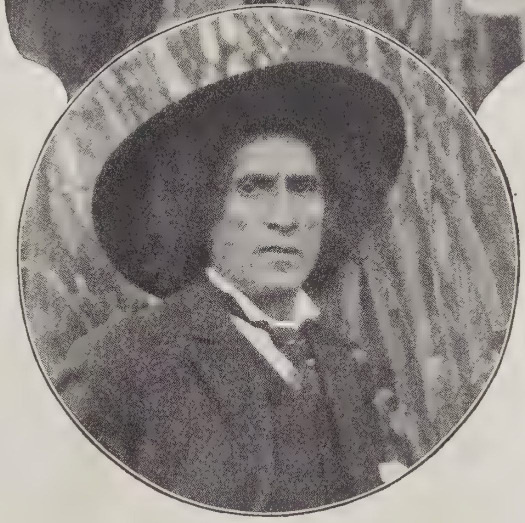


"The Last of His Race," posed by Corsi for a recent motion picture.





Corsi as the famous Padre Junipero Serra, founder of the Spanish missions of California.



ANTONIO CORSI,

The most widely known artist's model. Above—Corsi, as a Bedouin fresh from the desert, posed for a motion picture, to which Corsi has turned after 40 years of posing, as a model for artists, in more than 1,000 canvases.

LIVING simply in a little, rose-covered bungalow in Southern California is a man who has had his remarkable, changeable face and pliant figure painted and sculptured more times than any other person. His name is Antonio Corsi, and he is the world's most famous artist's model; indeed, it is doubtful if any other character, either mythological or real, ever has been painted so many times as this dignified yet companionable son of Italy, who, for more than 40 years, has been posing for the leading painters and sculptors of the world.

Corsi, then 11 years old, was playing with a band of wandering minstrels—his father, three brothers and sister—in Italy, early in 1882, when his striking face attracted the attention of Felix Moscheles, who carried him to London, and there started the lad on a career of posing which has put his face or figure, or both, into more than 1,000 canvases and pieces of sculpture. Established as an indispensable factor in the studios, Corsi later traveled through Continental Europe, posing for many of the world's most celebrated artists, and forming relations of friendship with these painters and sculptors unusual as between artist and model. He had the faculty of study and of adaptability; he studied the eccentricities and the particular demands of each artist, and adapted himself to the needs of each, so that he was called in for all manner of poses, some of them hours in length, one, done a number of years ago, lasting three hours and 20 minutes in one position, and believed to be a record for this sort of work.

Doubtless every one who reads this brief story of Antonio Corsi and his art—for he is no less an artist than the painter or the sculptor who limns or models him—has seen his face in some favorite painting, or in some group of statuary. It is Corsi who appears as the Christ on the cross, in "The Crucifixion," the painting by Princess Louise, then Duchess of Argyle; and it is Corsi who transforms his face into that of the Devil, in Baron Ariald Rosenkratz' painting, "The Tempter."

His piercing black eyes hold your gaze within the white draperies of Hosea, the most widely known of all the many prophets painted by John Singer Sargent; the figure of Sir Galahad, in Watts' painting of the glorious young knight, is Corsi, and again he appears as the St. George of Burne-Jones' famous "St. George and the Dragon." Also, it is Corsi again in the pain-tortured body in the same artist's "Wheel of Fortune." Holman Hunt used the Italian lad for his model in "The Light of the World," and two of Sir John Millais' most celebrated pictures—"The Runner," and "The Order for Release"—show Corsi as the principal figure.

Eleven of Sargent's "Prophets," as painted for the Boston Library, are from posings by Corsi, while he appears in 58 different poses, taking the characters of as many knights, in Abbey's painting, "The Holy Grail," the various suits of armor having been made to fit him by an old armorer in Gloucestershire, where Abbey did most of the work on this masterpiece. Abbey's "Penance of Eleanor, Duchess of Gloucester," made that artist a member of the Royal Academy, and it was Antonio Corsi who posed for all the male figures in that painting.

As a model, Corsi traveled through Italy, France, Switzerland, Germany, Spain, Morocco, Egypt, England, Scotland, Ireland, Canada, Denmark, the West Indies and the United States, and, now, like many artists and sculptors, he finds that the demand for art is not so great as it once was, and, consequently, the calls of his services as a model have decreased. But, unlike most members of the world of art, he took care of a portion of his earnings, and, consequently, can live in comfort in his own flower-bowered home, with only an occasional character engagement in motion pictures, or a semi-occasional call from some studio on the Pacific Coast. He has posed for nearly 150 artists, and has collected 100 different costumes, from the scanty apron of beads and bow and arrow in which he has posed many times as the American Indian, to the all-enveloping brown garment in which he impersonates the revered Padre Junipero Serra, father of the Spanish missions in California. At Carmel-by-the-Sea, he now and again poses for art classes, and of his posing, here and there in the world, he tells a frequent good story, for the memory behind the wide forehead and beneath the great mass of coal-black hair is as brilliant and sparkling as the deep-set black eyes.

"One morning at Carmel," said he, "when I was posing for a picture of Father Serra, several persons, passing, paused to look at me, not seeing the artist, who was half concealed behind a near-by bush, where, as a matter of truth, he could get a little shade, though I had to stand in the doorway of a ruined building where it was all sun. One woman asked, 'Father, when do we have services?' and when I turned my eyes on her to reply, another crossed herself, and drew backward, as if she had at first thought me a statue, and then, seeing my eyes move, concluded I must be the Devil in a monk's garb."

Corsi also posed for Frederick Leighton, Countess Fedora Gleichen, the late Empress Fredrica, of Germany; Jean Leon Gerome, Alma Tadema, Alphonse Le Gros, William Adolphe Bougereau, Hubert von Herkomer, and scores of others, all of whose autographs he has in his "Book of Names," into which is written the name of every artist and sculptor before whom the once wandering Italian minstrel boy has posed since 1882. Corsi came to America in 1901, and, his reputation having followed him from Europe, he was warmly welcomed in the art colonies of the eastern states.

Moving westward, he posed for many of the figures which adorned the buildings and grounds of the Panama-Pacific Exposition in San Francisco in 1915. In "The Nations of the West," "The Court of the Universe," and other groups at this exposition, it is Corsi's face and figure that appeared, while he was the model for the statue of "The Scout," which attracted more attention than any other single piece of similar work at the big fair. Today, he is preparing for more posing, for figures, murals and paintings for the Portola Festival, which is to be made an annual fête in San Francisco, similar to the Mardi Gras of New Orleans, and the Rose Carnival at Portland.

Mr. Lasker Reveals Himself

WHEN the bigger Harding emerges, he will reconsider Mr. Lasker's qualifications to head the Shipping Board, as based upon Mr. Lasker's keen and helpful interest in the debts of the National Republican Committee. Or, if cause for action would be embarrassing, were it to go back so far and so intimately into party affairs, the Chicago speech of Lasker, with its appalling evidence of utter divorcement from the American idea, might serve as sufficient cause. Mr. Lasker has not yet got the atmosphere of this country. Not only that, but true to his type he insists that the rest of us get his atmosphere. He is one with those who would throw America into the international melting pot and broil it until it comes out unrecognizable from the Balkan mess that swarms upon us. Inconvenient as it may be for Mr. Lasker, we cannot consent to make daily exceptions in the Constitution of the United States for his type of immigrant, the type for which he pleads so lustily. We don't want the type of immigrant who demands that we amend the Constitution before he will step ashore, and we don't want that type of mind at the head of the Shipping Board. It cuts American pride to the quick to see that type of individual made free of the White House, even to being the personal escort of the President's family. Certainly no single thing has done more to cheapen the whole *ensemble* of the Harding Administration. And it is the more unfortunate because it was so unnecessary.

At the Chicago banquet table, the President might have seen, had he been there, two men of whom his Administration cannot too soon be rid. One administers the Constitution in a way that gives the impression that it is a most loutish document, and the other regards it as a piece of inconvenient ancient history. These men are not either of them or both of them together strong enough to be a menace; they are simply cheap insults to the nation—and the very dignity they achieve as insults is drawn from their proximity to the confidence and power of the President.

Going Fifty-Fifty on It

A GENTLEMAN from England was in the office the other day, and toward the end of the conversation, so far toward the end of the conversation that for once it seemed that the remark was not to be made, he remarked about "our" having all the money and Europe having all the debt. He was only repeating, of course, what everyone in Europe is saying, and perhaps we ought not to take it too seriously; it is natural for harassed statesmen to seek a scapegoat for their unsolvable problems.

The reply that was made to the gentleman from England was this: If it would mean anything to the *people* of foreign lands for the United States to remit the debts, the probability of its being done would be greatly increased. If the people of the United States felt that their just claims were really the cause of hunger and distress among the peoples of Europe, the impulse of the American people would be to wipe the slate clean at once, or let the account stand indefinitely without interest. But it is perfectly well known that remission of the debt would not make an iota of difference with the people of foreign lands, for the easement would not be passed on to them. The principal effect such remission would have would be merely to release pressure on international bankers, who in turn would see their war claims on the peoples of Europe mount in value, and who would lose no time in pressing for collection. The people would not be benefited in the least. And the American people are instinctively aware that remission is a game proposed by the international financier for his own benefit. The people behind the whole propaganda of remission are the agents of international bankers. And it is these bankers who are turning away scrutiny from themselves by pointing at the "rapacious Americans." The Americans are not "rapacious." The American people will not benefit by the repayment of loans, nor have they greatly suffered from the making of the loans. If some way can be devised to permit the benefit of remission to pass directly to the plain people of Europe, America would be in a much better mood to consider it. This is not a business between peoples, nor even between peoples' governments, but between the various branches of international banking houses.

Senator Ladd has made a proposal which mingles financial honesty with human justice, and is replete also with the element of mercy. He proposes that the international bankers go fifty-fifty with the United States and other governments in this policy of remission. "Let the big bankers cancel an amount of war securities of each of their respective nations equal to the amount their nations cancel of foreign debt. And then let the big bankers of Germany cancel an amount of German war securities held against the German people, equal to the reduction that may be made in the indemnity."

This is sound sense. It at least presents a test of honest intention, a test of desire to share in the work. So far, Mr. Barney Baruch's Williams College Conference and the American Bankers' Association have not felt that much practical sympathy, though they have expressed a great deal of oratorical sympathy, with the plain people of Europe and the world.

Daugherty on the Defense

ATTORNEY-GENERAL DAUGHERTY is on his defense before that greatest of all juries, the American people. He realizes that his most recent acts have been of a character hitherto without the precedent of high official sanction, new in the practice of criminal law, and a challenge to the American spirit of justice. Even among the interests in whose behalf the acts have been committed there is lack of unanimity in their justification. Criticism by those interests ranges from the characterization of "mistake" to "downright stupidity": and this from the class who would like to see the Daugherty actions sustained is pretty serious criticism.

Mr. Daugherty has been speaking in his own defense. In so doing he accepts the arraignment and pleads to the issue. That he will not hesitate to use subterfuge is shown by his claim that the parties against whom action has been brought are in rebellion against the government. This is not the case. *The individuals whom he seeks to prevent exercising rights guaranteed by the Constitution of the United States are a part of the government* as are those with whom they have differences. If Mr. Daugherty believes that the "Government" is the little group of men who sometimes meet at night in the McLean residence at Washington, he is as yet uninstructed in the elementary facts which every lawyer should know.

Yet in his precipitation Mr. Daugherty may accomplish something he has not intended, something of immense benefit to American citizenship—he may have awakened an apathetic public to the necessity of that eternal vigilance which is the price of liberty. The encroachments of privilege on individual rights has made alarming headway in late years, and it may have needed the shock of just such maladministration of government to arouse the people to what will surely happen if such encroachment is not ended and a return made at once to the fundamental principles of the great American democracy.

Another Treasury Juggle

IT WOULD seem that government officials believe the people are so easily deceived that no matter how open their statements to criticism, they will be taken as truth without question.

In the face of the fact that President Harding was compelled, in his veto of the bonus bill, to acknowledge that the roseate view expressed by the Treasury Department in July was unwarranted, the same juggling of accounts is used in the report for September to convey to the public the impression that conditions are better than they really are.

The fact that customs receipts totaled much more than was anticipated for the quarter ending September 30, is made the basis of a statement of debt reduction which is not borne out by facts, for it must be remembered that the increase came because of excessive importations *to avoid the new tariff act*, and must in the end represent a loss to the Treasury. This loss will not affect the prices to the consumer; prices will be the same as if the higher duties were paid under the new tariff law, which the importers evaded.

Premier Plays His Last Card

THE so-called "fall of Lloyd George" is more like the sidestepping of Lloyd George. It might have been a fall, but for his fast foot-work. He is probably the last of an intermediate type of statesmen who are more noted for their movement than for their achievement. Roosevelt was of that type, though Roosevelt left behind more solid accomplishments than Lloyd George can do. It is impossible to connect Lloyd George's name with any great outstanding work of statesmanship—unless, of course, one is willing to forget the Old Contemptibles and say "he won the war." Lloyd George did not lead Britain into war and he did not lead her out—she is still in. In a series of world-thrilling spectacles he has tried this and he has tried that, and his record from Versailles to Geneva has been a record of abject moral failure. It was not the greatness of Lloyd George, it was the Britain behind him, that allowed him to act as ringmaster of Europe as long as he did. A lethargic people, his vigor delighted them; a desperately logical people, his inconsequentiality intoxicated them; a tongue-tied people, his volubility hypnotized them. But when Britons saw the yawning gulf of a Mohammedan war at their very feet, they awoke with a start, the voice of popular authority rang out and broke the spell of Georgian hypnotism. And then the premier played his big card—he resigned. But Britain goes on.

The resignation itself may be only a move in the game. In America, its significance is easily misunderstood. The situation may be stated briefly: Lloyd George owed his supremacy to a coalition between British parties; that is, the British people agreed to forget parties during the war. It was the same spirit which in America dropped partisanship during the war. In the ordinary course, the Coalition would have dissolved immediately the war was ended. But it was just there that Lloyd George's world-thrilling activities began. He shouted far and wide that the kaiser must be tried, and Germany punished, and the persons guilty of starting the war hanged to the highest gibbet. Well, the kaiser wasn't tried. Nobody was found guilty. Nothing, of all the things Lloyd George promised and demanded, was done—nothing. But something else was done. The Jewish Program was put through at Versailles, in India, in Palestine, in Poland and throughout the Balkans with a skill and a precision that worked silently while Lloyd George held the attention of the world with his ballyhooing. Two Jews were put over India, and the India defection is the result. A whole department of Jews was put over Palestine, and the very serious and menacing Arabian defection, approaching world war again, is the result. The British people know this now. The prolongation of the Coalition could not have better served the plans of the International Financiers if it had been mapped out in advance—but, quite probably it was. And because of the group behind him, neither British, nor anti-British, nor anything but Jewish, it will probably be impossible to tell just how able and resourceful a man Lloyd George is in his own right. His footwork is undoubtedly his own; but his head-work was often the suggestion of the inside group.

The British people know this now. Like a rosary of tragedy they tell the blunders of Lloyd George: the alienation of India, the bloody stupidity of Ireland, the separation from France, the breaking of faith with the Mohammedan world—the breaking of Britain's sealed and given word; and, finally, the abject retreat before the Turk and agreement with his humiliating terms. And in the midst of it all, a gross scandal at home regarding the sale of honors. In all this, the historian will search in vain for one moment when Lloyd George rose to the stature of a world statesman, for one act in which Lloyd George served his own Britain or the world, for one word in which he enshrined the thought or the hope of his generation.

His resignation means that, to cover up the toll of his failures, he has allowed the Coalition to lapse; he has allowed Britain to go back to the checks and balances of the party system. It may not mean his elimination from politics, for he is now a candidate—whether for election by one of the old parties, or by a new Third Party, it is impossible at this writing to determine.

It would be pleasant to be able to say more praiseful things of a man who has held the stage so entertainingly and for so long. But what has he done? That is the question which turns the whole show inside out—what has he done? A somewhat bewildering silence follows it. And yet, in the general scheme of things, in the development or chastisement of Britain, in setting the stage of the next world war and allowing The Internationals to foment and regiment the Mohammedan East, Lloyd George may have been the instrument of a Destiny whose outlines are yet to appear. But even that will not make him great nor deserving of praise; Judas also served Destiny.

Mr. Ford's Page

AMERICA today is the most hopeful country in the world because of all countries she has the soundest foundation for hope. Here we have never felt that we were at the end of our rope and have never felt in danger of catastrophic judgment, and the reason for our freedom from incipient despair is this: we have always known that there was a check-rein on our more dangerous evils. Confidence in the self-corrective spirit of American life has not been lost. Elsewhere in the world this spirit has been lost and, with the possible exception of one other nation, Great Britain, the countries of the world are helplessly looking for help from without.

Of course, we have had our discontents and our dire forebodings, but a study of these will serve to illustrate and prove the point just made. Take the story of American discontent and follow its development. At the beginning of the nation the principal discontent was political and hinged upon the relations of the Colonies to the Mother Country.

That matter settled by the country securing its political independence, the next form which the discontent of the people took was moral. Two great questions monopolized between them the public mind previous to 1860, and these questions were Liquor and Slavery. Unless we go back to those times we cannot realize how vivid those questions were. The actual abolition of the liquor business was not nearly so exciting as the campaigns against it previous to the Civil War. But of the two great questions, Slavery became first and was settled first, leaving the other to run for more than 50 years. New lease of life was given the liquor business by reason of its being tied into the taxation system to pay the expenses of the Civil War, which thus made it one of the supports of the Government. But even that partnership with government did not save it in the end. Nor will the law violators' partnership with government officials save the business of bootlegging.

It is characteristic of our country that it is the moral motive that mostly moves it—that is, in those matters where the decision and will of the people are essential.

Only within recent years has the discontent of the people become economic. And to say that is to say more than appears on the surface. There was a time when this nation had surplus attention and energy to give to the moral aspect of things, to regard the condition of a bond people, to measure the morality of the liquor business, to assert itself in behalf of the oppressed on a neighboring island. When was that time?—it was when this nation was comparatively free of economic discontent. But we are now in a time when the world is saying that we have no time or attention or sympathy to give to the oppressed and suffering of the world. And as our people hear the charge and look at themselves, they are half persuaded it is true, they are amazed at their own unlikeness to themselves, they ask themselves whence the change. What is the difference between the time when we had a surplus of attentiveness and helpfulness, and the present time when we are charged with not having even a decent degree of these qualities? The difference is here—this nation, this people, is burdened now by a sense of economic distress which imprisons its natural sympathies.

It is contrary to human nature that the milk of human kindness shall flow freely when fear and pinching calculation become the outlook and occupation of the people. And these economic pressures are not caused by the increase of our population, for production has increased still more amazingly; it is not caused by the higher standard of living, for we are capable of sustaining a much higher standard than we have attained. It is caused by a system of financial drainage and servitude which was fastened upon the people in the period succeeding the Civil War and which is now beginning to show its worst effects. Our financial system is an imported one which was imposed upon this people 50 years ago, superseding the system under which we became and for 80 years remained a free, frank and open-hearted people. That is the explanation. Put a man in fear of his livelihood and in money difficulties and you change the aspect of the man's spirit toward the world: this is what has been done to our nation.

But that is not the end of the story. The development of our economic discontent may be traced with considerable benefit to our thinking. At first it showed itself in an ugly mood, one of jealousy and hatred. The complaint was against those who had anything at all. Whether the root of the possession was cunning or skill, service or speculation, did not matter. The mere fact of possession constituted the crime. There were, of course, many influences which contributed to that thought. Men who had money, simply had money; we heard of the So-and-So fortune, and the This-and-That fortune; it was just money heaped up and glorified. The men who had it did not know what to do with it, it did not occur to them that money was not a private vice to be enjoyed but a public implement to be used.

However, the very ozone of America became fatal to that form of discontent and it speedily changed. It became a discontent of ambition instead of a discontent of jealousy. Instead of complaining that a few had possessions, instead of making possession to be the crime, the complaint became that the many did not have possessions, and non-possession became the crime. There was enough for everybody, everybody should have enough. It was not necessary to take away, but rather to increase the distribution. And this form of discontent was much more wholesome.

Now, it is that form of discontent that is going to rend the present system, for the present system is not founded on the principle of the utmost service to all. It is not the increase of a poor class, but the increase of an economically comfortable working class that is going to work the change. The House of Want is falling into ruins, the House of Have is springing up everywhere, and it takes a different financial system, a different productive system, a different political system to serve a nation of prosperous freemen than it does to serve a nation of downcast and dispossessed people. Not different in form, so much, but different in purpose, different in spirit. The new system will probably work with most of the old tools, but the purpose in it all will be not only more human but more scientific, and not less businesslike but more so.

It is amazing the dislike which some people have for that term "business." They think it is the exact opposite of all the poetry of life. They are wrong—business is the only possible guaranty of the poetry of life. Business is the organization of the material side of life, which heretofore has always been getting into the way of the higher life. Bad business is, of course, not business. It is a fact that many of the fundamental business principles of the day are not business at all, they are bad business. It is bad business that is in ill odor. It is bad business that makes "business life" the ruthless, uncertain thing that it is. It is bad business that throws all the machinery of supply and distribution into confusion every little while. Some day the fools and the criminals are going to get out of business, business principles are going to be allowed to rule in business; that thing called "principle" which most of us are publicly polite to and privately despise is going to have its rightful place, and not only will the rewards of business be great, but added to that will be the honor given it by the whole people whom it will be serving. The function of finance and commerce and manufacture and transportation is to insure the harmony and prosperity of the people's life, and the era of "good business" will not be here until they do.

PEOPLE used to complain because a few possessed the comforts and advantages of life. The enmity was against the comforts and advantages. But that form of discontent has changed: people now complain because everybody does not possess the comforts and advantages of life. And that is the right kind of discontent—to make prosperity and not poverty the standard. Things would be unutterably worse if all were reduced to the same level of poverty, as some have proposed to do. The better way is to elevate all to a high degree of independence and comfort. That is the true function of finance, manufacture, commerce and transportation, and until these do function primarily to such ends, they will be in danger of constant change. The new discontent has the power of a higher civilization behind it.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Myth of Henry Cabot Lodge Exploded

The Icicle of the North Who Ever Has Represented the Established Order

By HAROLD D. CAREW

WHEN Henry Cabot Lodge arrived at his grandfather's house in Boston in 1850, a potential star appeared in the political firmament. It was a star of manifest destiny. Like all scions of Boston's "first families," young Cabot, who was given his mother's family name, was nurtured under the sheltering influence of a stern Puritanism. His people's people had long been known as respectable tradesmen, and by the time the child Cabot came they had risen to affluence.

Henry Cabot Lodge was born into the Established Order, when all New England was divided on the slavery question, and was destined for a career in politics before he was out of his swaddling clothes. As with all sons of aristocratic Boston he was sent to a select private school in his native city to prepare for Harvard. At Harvard he developed a hobby for writing, which was acquired rather than inherited, was graduated at 21 with his bachelor's degree, received his LL.B. four years later, and the next year, at 26, was admitted to practice law and made a doctor of philosophy. While he was at the law school he edited the *North American Review*, lectured on American history from 1876 to 1879, and the following year became a politician by getting himself elected to the Massachusetts house of representatives.

His fondness for the Established Order had led him in his youth to select Alexander Hamilton as his political patron saint, and in 1882 he blossomed out as a biographer of the aforesaid Alexander. At the State House on Beacon Hill he learned his first lessons in practical politics, and it was in those years that the Great Myth, the Infallibility of Lodge, came into being. Understanding Lodge has to do with the Great Myth which is responsible for the fiction that the senior Senator from Massachusetts is the embodiment of her traditions.

To say that Lodge represents the Massachusetts tradition is to say something that is not true. The militant men of Massachusetts who are remembered in history are the liberals of a vanished day—men who put principle above expediency, men who refused to play the game, to pussyfoot, to straddle. Mr. Lodge is not in their class. His training and environment are against him. To understand Lodge you must orient your mind, not to historical fiction, but to historical fact.

Mr. Lodge does not represent the Massachusetts tradition, for to be its representative he must represent Sam Adams and Hancock, Wendell Phillips and William Lloyd Garrison and Charles Sumner and those other political liberals who first put Massachusetts on the map. Mr. Lodge would have blushed with shame to be seen in their company, and the first families of Boston would have shuddered at the spectacle of another good boy gone wrong, just as they did when Phillips, son of Boston's first mayor and heir to a comfortable fortune, threw himself into the abolition crusade. Only birds of a feather flock together, and Mr. Lodge isn't that kind of bird.

Holds Hamilton as Ideal

ENGLAND put a price on the heads of Adams and Hancock in 1775 because they dared to counsel rebellion. Listen to Mr. Lodge, the orator for political effect, speaking in the Old State House at Boston the other day at exercises commemorating the 200th anniversary of the birth of Adams: "Both Adams and Hancock were looked upon as extremists and dangerous men. . . . Adams went to Philadelphia as one of the delegates to the Continental Congress. Think of the atmosphere of suspicion he encountered there!"

By whom were Adams and Hancock looked upon as "dangerous men"? Not by the inhabitants of Boston who enlisted in the patriot cause, but by the Tories, the standpatters of that day, the straddlers who counseled compromise. If they were living today, Adams and Hancock would still be shouted down as "dangerous men," and Henry Cabot Lodge would be on the side lines egging on the shouters. The Lodge complex admits of no other deduction. Mr. Lodge venerates the memory of these "dangerous men," but they look safer to him 147 years away.

As usual, Mr. Lodge let the cat out of the bag. In that same address, he added: "It is true, however, that Adams was not a constructive man of the type of Hamilton." Here Mr. Lodge runs true to form. Hamilton is Lodge's political ideal—Hamilton, the leading standpatter of his day and generation, who stood out against all his colleagues in the first Constitutional Convention for the enthronement of a monarchical form of government for the Colonies!

Wendell Phillips and those other men who made Massachusetts history during the nineteenth century were the political outlaws of their time. They, too, were regarded by the standpatters of their day as "dangerous men."

Phillips and his confreres opposed chattel slavery. Just where would Mr. Lodge have stood on the issue? The Lodges and the Cabots loomed large in the social registers of a bygone generation, but they played no part in the great epochs which have made Massachusetts what she is historically. Their wealth gave them eminent respectability, but eminent respectability in Boston during the last century was not lined up with great causes. They were conservatives sired of the old stock that "viewed with alarm" and "looked forward with apprehension." Their social eminence kept them out of the great political movements of their time, and it is reasonable to suppose that Henry would have followed in the parental footsteps.

Phillips and his friends were ardent prohibitionists. Mr. Lodge is lined up with the crowd in Washington that votes one way and drinks another. Phillips and the rest of the old Boston liberals were pioneers in the fight for equal suffrage. Mr. Lodge was one of the Old Guard die-hards who opposed equal suffrage to the last ditch. He was always consistently inconsistent, and he is now urging the women of Massachusetts to exercise their inherent rights of citizenship by going to the polls and rolling up a big majority for Henry Cabot Lodge, candidate for re-election to the Senate of the United States.

In 1835 a mob made up of the "best people" of Boston dragged William Lloyd Garrison through Washington street in Boston with a rope around his waist, threatening to lynch him. In 1860 another mob in broadcloth led by Boston bluebloods whose fathers' bank accounts had been put in jeopardy by the anti-slavery movement, followed Phillips from old Music Hall, where he had made a ringing speech against Northern mill owners who were growing rich out of slavery, to his humble home in Essex street, threatening to hang him to the nearest lamp-post.

All these episodes are part of the record which embodies the Massachusetts tradition. Henry Cabot Lodge is no rightful heir of these Massachusetts men who are best known to history. They stood up in their boots and fought. Henry Cabot Lodge only pretends to. Politically Lodge is 50 years behind Phillips and Phillips has been dead 38 years. How much of a liberal does that make of Mr. Lodge? He does not represent the Massachusetts tradition as the Great Myth would have us believe. He does not belong genealogically or temperamentally to that race of men, although he has been cashing in on their glory for nearly 40 years.

But He Is a Politician

NO, NO! Make no mistake! The verdict of history stands. Mr. Lodge does not represent Massachusetts tradition. He is the political descendant of New England's rum-and-codfish aristocracy that made its fortunes in the East India booze trade when Boston drank rum as unashamedly as Washington drinks contraband today. He is the political descendant of the old Boston conservatives. He thinks as they thought, feels as they felt, and if anybody thinks he hasn't acted as they would have acted, let him look at Mr. Lodge's record. During his career as a Senator from Massachusetts the voice of Lodge has been the echo of the howling pack that damned every liberal movement of the last century.

Massachusetts is proud of her traditions, and rightly so. Her traditions are America's traditions. The Massachusetts of the fathers was liberal. The faith of the fathers (a phrase Mr. Lodge uses for the political effect he thinks it wields) was a liberal faith. The sleepy conservatives, of whom Lodge is fundamentally a prototype and a counterpart, are not even remembered except as the political obstructionists of their day. Lodge is theirs by training and by thinking. The mantle of the Immortals does not fit him. The vaunted claim that he is their spiritual heir and assign forever is spurious.

Whatever else Mr. Lodge may be, he is a consummate politician. He could not help being one if he tried. The character of the man is so much the character of the politician that it is impossible to separate the one from the other. But like the ghostly procession that paraded through Richard's dream on Boswell's Field, he has been paraded through the public prints for so many years as "the scholar in politics" that people have begun to mistake the politician for a statesman.

Mr. Lodge represents a unique type and he himself is the master specimen. The outward Mr. Lodge is an amiable man, as politicians go, with an ingratiating smile. But it is a cynical smile that somehow doesn't ring true when the subject is politics. He will discuss literary subjects readily enough, but when it comes to politics he crawls into a shell. That is to say, you can't pin him down. He prefers to leave the catechising for smaller fry. There is, however, no more practical adviser when it comes to devising campaign ways and means of putting Henry Cabot Lodge across. And on the stump he has all the political artifices of a clever evader. He never hesitates to employ the tactics of the professional politician. Why should he? He himself is a professional of professionals.

With him abstract political ideals have no place in the category of Things if they conflict with political expediency. This was never better exemplified than when the chief prohibition enforcement officer for Massachusetts swooped down upon a banquet, given one night last November to Governor Cox by a group of party leaders at the historic Quincy House, and seized a large quantity of liquor. The liquor was being served in a private dining room directly over the banquet hall. A prominent Boston attorney and friend of Mr. Lodge was the doorkeeper who admitted the thirsty ones, according to the allegation of the raiding official. The story of the unceremonious raid on the banquet was printed on the front page of every newspaper in the state except the Boston *Herald*, organ of New England standpatism, which makes itself ridiculous every now and then by its editorial contradictions. Massachusetts was thrown into an uproar and when the news reached Washington it created consternation. The prohibition officer, whose appointment only a few months before had been recommended by Mr. Lodge at the behest of the Anti-Saloon League, declared over his signature that he was told by one of Lodge's henchmen the night of the raid that he would be "fired." The raid was made unostentatiously, but the newspapers played up the story in a sea of printer's ink and the fight was on. The political powers that be in Massachusetts declared that the prohibition chief must go.

Great mass meetings were staged all over the state on behalf of the prohibition chief, who appealed to the churches for support, declaring that as an official sworn to enforce the law he intended to enforce it from the top down instead of from the bottom up. Fifty clergymen headed by the Rev. Dr. A. Z. Conrad and the Rev. Frank Kingdom, of People's Methodist Temple, staged a noonday rally in Tremont Temple, one of the largest auditoriums in Boston. Dr. Conrad characterized the Republican banquet as a "bacchanalian orgy" and a disgrace to the party leaders. Resolutions protesting the threatened dismissal of the prohibition chief were adopted by the 3,500 men and women present and telegraphed to Lodge. Hundreds of telegrams and letters poured into Lodge's office at Washington from all parts of the state. One telegram, which was given to the press, called upon Lodge to stand up in his boots in defense of a man who had done his sworn duty, declaring that "a Republican party propped up by whisky barrels and beer kegs cannot survive."

And what did Mr. Lodge do? Did he stand by the man whose nomination he had approved? *He did not. He passed the buck.* He "washed my hands of the whole affair." He had no power to act in the matter! It was something for Internal Revenue Commissioner Blair to settle. Here again we get a glimpse, not of a statesman, but of a past master in the science of practical politics. It was a ticklish matter to be settled, especially when public opinion had become so aroused; for even those who boasted of being "wet" were all with the prohibition chief who had the courage to expose public officials present in a hotel where liquor was being served illegally and in defiance of the Constitution. The question would be settled, and those who know how politics is played in Republican Massachusetts had no misgiving as to how it would be settled. Commissioner Blair stepped in. The political wiseacres advised him to wait until public indignation had died down. He did. It would never do to make a bad mess worse when so many ministers were prodding Lodge to do his plain duty. *But a month later the prohibition chief got his walking papers.* He was dismissed for "insubordination"—whatever that might mean. Lodge, the dictator of Federal patronage in Massachusetts, could have prevented the dismissal with a wave of the hand, but the young prohibition chief had committed an unpardonable sin. He was kicking up too much of a rumpus, and a rumpus, to Mr. Lodge's way of thinking, does not make for party "harmony."

A far-fetched commentary on Mr. Lodge? Not so far-fetched as it might be. It helps to explain Mr. Lodge.

Mystery and Alibi

THERE are two marked elements which, taken together, explain Mr. Lodge: Mystery and Alibi. The first is taken care of by the Great Myth. The second—what shall be said of it? Mr. Lodge has been a Senator for so many years that he has come to regard the office as his by divine right. But for all that he is politically superstitious. He lives on flattery and adulation, but he cringes under criticism, even though the outward Mr. Lodge doesn't betray what is surging within. He has no interest in other men's political fortunes except as they affect his own. His convictions, if he has any, are deep-dyed secrets. Secrecy is one of the attributes of the Lodge complex. Political principles, like party platforms, so far as he is concerned, serve only one practical purpose. They are like the steps of a train—something to get aboard on. As a professional politician he knows their value. He is no theoretical idealist. He has no illusions. The school of politics in which he was trained admits of nothing but practicality.

His political creed may be summed up in one word—Protection. He believes in Protection with a capital P. He believes in it commercially, industrially, politically. He is an Organization man from start to finish. And why shouldn't he be? It is the Organization that has kept him where he is. That is why he bows to the wishes of the Organization, which he regards as the backbone of the party, instead of to the demands of public opinion. He ignores public opinion and trusts in the Organization, the perpetuator of the Great Myth, to explain to the voters that Henry Cabot Lodge is first, last and foremost the world's greatest champion of all that is righteous. And for some unexplainable reason the charm works.

The men of little minds who make up his Organization are ready to do his bidding. To them Lodge is a fetish. They are the official explainers, the alibi disseminators who exalt the scholar in politics. Behind the Organization is an inner circle—the circle of interests that keeps the Organization well oiled. The inner circle is made up entirely of the industrially great of Massachusetts, the Powerful Few who reap their profits and amass their fortunes because Henry Cabot Lodge can always be depended upon to stand without hitching.

Mr. Lodge talks much of the "New England conscience." It is one of his favorite topics, especially when he is bidding for what the clever politicians are pleased to call the "church vote." Here again the Great Myth comes to the rescue. No one knows its value from a political standpoint better than Mr. Lodge. It is a force to be reckoned with. And we find, not a statesman but a politician who knows all the tricks in the game. Not that Mr. Lodge cares for the "church vote" as such, for he doesn't. It helps to swell the total of votes sufficient to keep him at Washington. And so Lodge is heralded by the claquers of the Great Myth who extoll his moral virtues. It makes no difference that he is against prohibition, that he is forever "non-

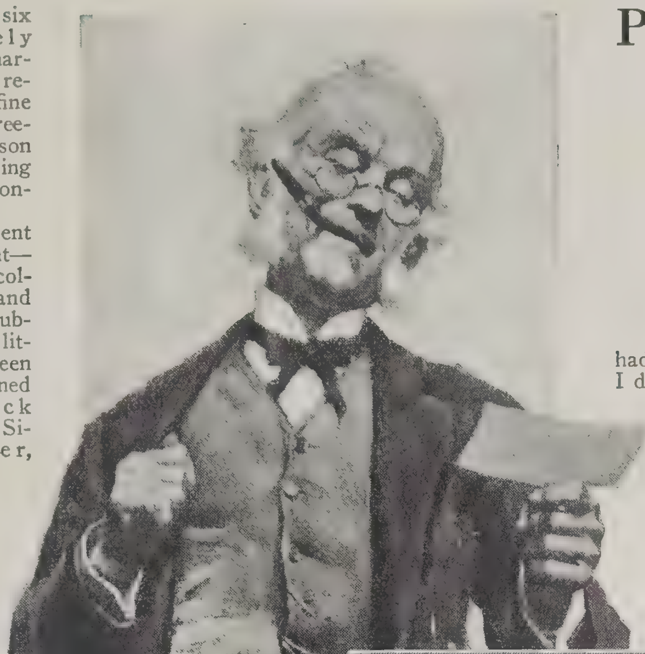
The "Grand Old Man of American Fiction" and the Author Who Brought Him to Life

Peter B. Kyne on Necessity of Earning a Living by Some Other Means While Learning Job That You Love

By LEE D. BROWN



"By the Holy Pink-Toed Prophet — where there's a will there's a lawsuit or a heartache!"

WHO are the six most widely known fiction characters created during recent years? What a fine chance for a rousing free-for-all fight Mr. Edison missed by not including the query in his questionnaire!

To an accompaniment of verbal bombardment—from reviewers and colyumists, professors and preachers, women's clubbists and long-haired literati—there'd have been one grand old-fashioned riot, with Sherlock Holmes, Mark Sabre, Simon nicknamed Peter, Babbitt, the Sheik, and a phalanx of feminists commanded by Carol Kennicott dimly recognizable through the clouds of dust.

But who would have come off with first honors and fewest scars? Well, what six would you pick? Balzac called fiction "the private history of a nation," and if it is that, its best-known character, and his or her author, should be well worth knowing.

It would take a prophet or an election to place the laurel wreath definitely, but, having access to neither, I've recently asked several of the best-known editors of fiction magazines which character *they* think is most famous and their unanimous opinion may at first seem surprising to some readers.

"Just as Charlie Chaplin has become better known throughout the world than Julius Caesar ever dreamed of being," these editors said, in substance, "so has Peter B. Kyne's lovable old character 'Cappy Ricks' reached and gripped the attention of a larger audience, over a longer period of time, than any other character in recent fiction—probably than *any* previous fiction character in the world's history. His circulation has been enormous, running into many millions a year for over a decade—both Cappy and Charlie have enjoyed better circulation than any of the earlier celebrities in their own or any other field. In fact, Cappy has successfully invaded Charlie's field, the movies, as a result of his original success in print and he's still going strong in both. Needless to say, both Cappy and Charlie have had to display a high degree of what movie producers and editors alike call 'drawing power,' to be able to gain and then retain such a gigantic following."

So that's why they're beginning to call Cappy Ricks "The Grand Old Man of American Fiction." He isn't a "highbrow"—he couldn't be so popular if he were—but he has become such a real personality that unless you pause for a moment when you hear the name you're likely to forget he was born in a fountain pen, and you'd hardly be surprised at seeing his name listed as among those present at a business men's annual dinner.

On looking up the man who had been able to create such a personality out of words, pen and ink, and imagination, I found him about as surprising as the unexpected endings for which his Cappy Ricks stories are noted. He isn't a product of any ultra-modern cult or school of thought, and his parents did not, in his infancy, set aside large sums of money to provide their young hopeful with a "literary education." They raised him on a farm.

Kyne is a practical and good-natured California Irishmen who has discovered—more or less accidentally he thinks—that one of the best things on earth not to worry about is the necessity of earning a living by some other means while preparing for the work you love.

If it had not been such an uphill struggle for Kyne, Cappy would probably be less ingenious about getting out of tight places. His author's first "tight place" was a one-room schoolhouse in San Mateo County, California.

"At 15, or perhaps a trifle before that," says Kyne, "I left school because the same room couldn't hold me and algebra, and shortly after my sixteenth birthday I took the country boy's customary step out into the great world. I 'accepted' a position in a general-merchandise store in a neighboring village, worked from six a. m. 'til eight p. m. seven days a week at a variety of things, and received the princely sum of $20 a month and 'found.'

"About the time the Spanish War came along, I had made up my mind that if I didn't get out of that village, the village would get me for life; so I enlisted as a private in a regular infantry regiment. After a year of active service in the Philippines I returned to my home, where it was discovered that soldiering had left its mark upon me. I was a bit fly and worldly and full of self-assurance, so I was sent to a business college to work it off. I stayed six months and acquired a smattering of double-entry bookkeeping and learned to be a fast and capable stenographer and typewriter.

PETER B. KYNE,
Creator of "Cappy Ricks." He's 42—a Californian of Irish descent—and into the hectic career of his famous character, "Cappy Ricks," he has packed the experience and business wisdom that come from years of disappointment.

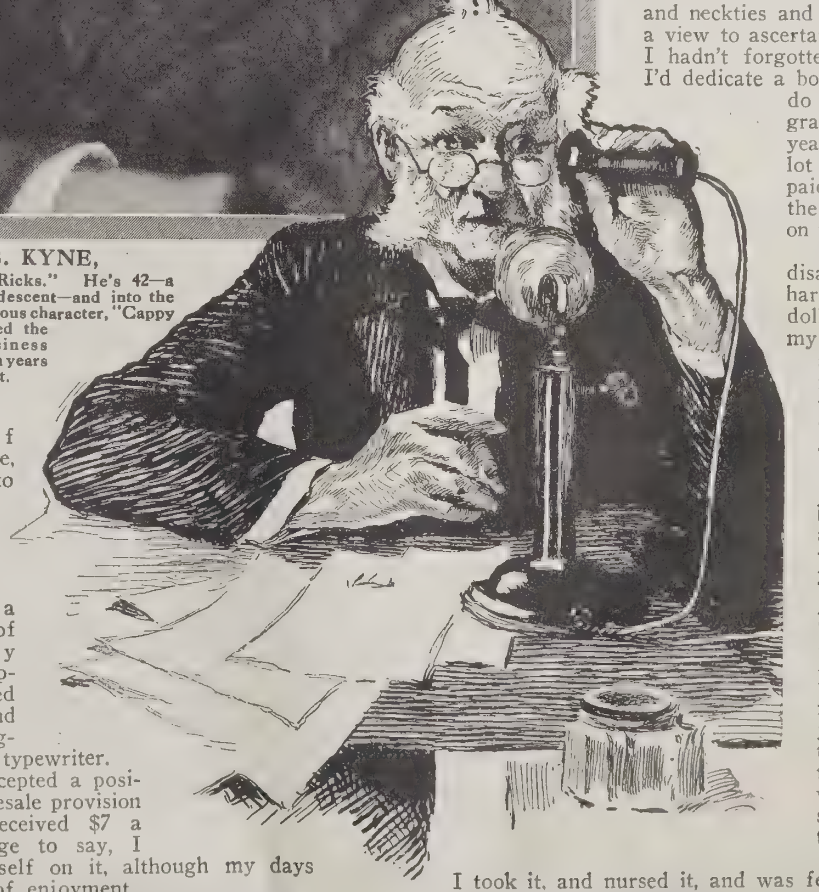
Then I accepted a position in a wholesale provision house and received $7 a week. Strange to say, I supported myself on it, although my days were barren of enjoyment.

"Presently I left that job and entered a wholesale lumber and shipping office at $30 a month. At the end of six years I was worth $250 a month but was making only $90, which discouraged me.

"I was a private in a troop of militia cavalry when the fire and earthquake destroyed a third of my native city. In the afternoon of that memorable day I managed to locate my troop and reported for duty policing the city. With a gun at my hip and a good horse under me, there came over me a feeling that I was free at last. No more double-entry for me. Somewhere in those smouldering ruins lay a better job and a broader future.

"With my job and one-third of the city gone, I decided to go into business for myself. Not having one nickel to rub against the other, I borrowed $250, rented a little store in a temporary shack on the San Francisco water front for $125 a month, hired a manager at $100 a month, wired it, papered it, built a show window and wooden fixtures, put in a meager stock of men's furnishing goods, and was my own man. This is the Arabian Nights period of my life, and I do not like to write about it. I stocked that store on 'jawbone,' as we say in the army. I was absolutely unknown, yet I performed that miracle! The reason? Well, San Francisco is just—San Francisco, and a very tender, tolerant, whole-hearted San Francisco she was in those days of terror and misfortune.

"I lasted 23 months. I think I might have lasted longer, but I didn't want to. I had an idea that all the money I found in the cash register was profit, and spent it accordingly. That business was a side issue, anyhow—the result of a wild impulse. Everybody had those wild impulses after the great disaster. Mining-camp stuff. Three months after I had started that business I hated it, and hoped it would burn up so I could get the insurance, pay my bills, and quit. But I was crippled with rheumatism and couldn't work for anybody else, so I had to stick. As soon as I was able to walk, however, I went back into the lumber and shipping business and let my manager run the store until one day a strange man came and pasted a notice in my window and started sorting my socks and neckties and counting them with a view to ascertaining the assets. If I hadn't forgotten that man's name I'd dedicate a book to him. I could do this with good grace, because some years later I wrote a lot of short stories and paid for that failure at the rate of 100 cents on the dollar.



"Shortly after my disaster in Yiddish hardware, I got a few dollars together, quit my job in the lumber and shipping business, spread $40 worth of gold lettering on two neat offices in California street, and set myself up as a lumber broker. My beer-and-skittles days were over; I was 28 years old and something had to be done about it. How I worked! And how I worried trying to do business on nerve and jawbone! I did it, too. I was making the grade nicely, when I couldn't resist the opportunity to take a little flyer for a big profit. So I took it, and nursed it, and was feeling happy until I got chopped down with pneumonia in the midst of the deal—whereupon, like Cardinal Wolsey, I cried, 'Farewell! a long farewell to all my greatness!' Two months later I returned to my offices to pay the rent, sell my furniture, scrape the gold lettering off the windows and the black lettering off the doors. Then, like the ro-

You Want the Facts About Coal, Don't You?

A Straight Account of the Business That Tips You Over Every Winter

By A. R. PINCI

AMONG the many pastimes devised for self-amusement while traveling by railroad, constant travelers, especially salesmen and actors, play a modified "poker" game by selecting, haphazard, the numbers on the sides of freight cars, jotting each down, and comparing results. The highest or best "poker" hand, of course, wins. As freight-car numerals are often faded or blurred, it requires keen vision to catch them on the fly, especially because they run in sixes. As a result, wise players prefer gondola freight cars—generally coal cars—because the white numerals stand out better against a black background.

Yet that is not the only game that is played on the basis of a car number. What concerns you and me and everybody else in the United States is the sleek player who calls himself a broker and actually sells a coal-laden freight car by number. He buys said number, and turns it over as often as possible, or some other brokers in the same business do it, until it reaches the ultimate consumer. Every time this number is pyramided the price of the coal goes up, on paper.

Selling such a number does not always come within the province of what is known as "back and forth" selling. Back and forth sales mean the reconsignment from one shipper to another after each sale, a practice that is about to be restricted by the Interstate Commerce Commission, and may be restricted by the time this appears in print. To what an extent the Interstate Commerce Commission can impede this inter-brokerage coal peddling remains to be seen, since the brokers themselves are ready to stand on their constitutional rights, as they call them, averring that they deal with coal on rails as the stockbrokers do with certificates or bonds.

The broker who contracts for 1,000 or 100,000 tons of coal at the mine gambles upon his ability to sell said coal at a premium. This varies from a few cents to as much as a dollar a ton. In certain instances a higher premium per ton has been exacted, but that happens in times of "shortage" or in the case of special coal.

As the number of brokerage transactions is sometimes startling, it goes without saying that each involves a premium to gambling middlemen that is paid by the ultimate consumer. The number of brokers who go "broke" in this business is not great—at least the writer found no evidence of high financial mortality among them—because they develop a sixth sense that enables them to predict with marvelous accuracy just what the coal market will stand, where and how. It would be wrong to say that together these brokers dominate the coal market, but they influence it, and this influence is especially noticeable during periods like the present, when the industry is in the throes of disorganization.

Right here we face the extremely complex nature of the coal trade. In general it has been labeled as a seasonal trade. Why it should be seasonal is a mystery, and just about now *the Congress of the United States is officially wondering if this idea is not wrong.* The coal industry is to a large degree the key industry of the nation; it governs industrial prosperity and it governs the operation of our transportation and distribution systems.

The coal-mining industry is run on a haphazard basis. Little seems to be known about it except that there is a great discrepancy between cost at the mine and consumer's price. The operators claim losses, the mine workers claim inadequate wages, and all that seems to be a fact is that the coal industry is at as low level of efficiency and public service as it was 20 years ago, when President Roosevelt took a hand.

Industry Is Overcapitalized

PUBLIC sentiment is hostile to the coal industry. Unfortunately, this sentiment is seasonal. It finds expression or feeling when coal is needed late in the fall, and as promptly subsides with the first summer zephyrs. If the coal bin is full its owner worries not about the situation at the mines. If the coal bin is not full—as happens to be the case right now in millions of homes and modest factories—then follow semi-panicky conditions, state and Federal control, apparent shortage, limited distribution, warnings against careless use, but nothing is done to prevent similar conditions from recurring.

There have been many suggestions about methods of improving our coal situation. Just now the two favorite ones are "government control," mainly by price-fixing and official distribution, and taxing the "brokers" out of existence.

Government control may or may not be good; it is not for the writer to say, while taxation may or may not stamp out the evil practice aimed at. Omnibus legislation of regulatory character is never efficient. The former may lead to the agitation for nationalization of mines, with consequently increased bureaucracy, and the latter may mean eliminating the legitimate broker without actually eliminating the speculator.

Coal is a natural monopoly. *The center of coal resources of continental United States is in the middle of Nebraska,* while the center of *coal production* is in Eastern Ohio. Eastern coal, therefore, is being used faster than are the coal resources of the whole United States. Moreover, the best coal is being used; in some mines as high as 50 per cent of the bed is left underground, the amount depending upon the ease of mining.

It is well known, of course, that the coal industry is heavily overcapitalized, bearing in mind the fact that this means the best-paying companies, because it is current gossip that "coal paper" is not gilt-edged security in the banking world. The best mining properties are closely affiliated with Wall Street, and while bank-railroad-mine interlocking directorates are no longer as evident as a decade ago, the ownership remains virtually the same. Overcapitalization means high prices and low wages.

On the other hand, impartial authorities admit that there are between 150,000 and 200,000 more men in the coal industry than it needs if it were stabilized, of which at least half—and often more—make up the ranks of dissatisfied and striking workers. Put together, overcapitalization, overmanning and inefficiency in general bring on such horrible affairs as the massacre in Herrin, Illinois, and the murders of Mingo County, West Virginia.

According to official data, there are in round numbers about 11,000 coal mines in the United States, 5,000 of which are small, producing less than 10,000 tons a year. About half the total yearly production comes from 800 mines.

In the opinion of Dr. George Otis Smith, director of the United States Geological Survey, the simplest plan to stabilize the coal industry is to store coal and control its distribution by means of a fixed supply. Dr. Smith declares that coal can be stored without danger. Moreover, the proper and adequate storage of coal would mean an even and continual production, obviating the necessity of opening new mines, of which 1,000 were added in one year recently between Altoona and Pittsburgh. In the interest of efficiency, according to Dr. Smith, it is better to work old mines with proper railroad sidings and facilities than to add to the already excessive number of so-called wagon mines, which are not commercial concerns.

There is talk at present of coal costs mounting up to fantastic heights. There is no truth in this. Coal-mining costs have risen, but there are hundreds of companies that sell their coal, f.o.b. mines, at less than $3 a ton, and hundreds more that sell at less than $4 a ton; and these two groups alone deliver about 77 per cent of the total coal output for the given period. During that period, however, 16 companies sold their coal, f.o.b. mines, at $10.98 a ton, but this group's production was about 13 per cent of the total for the country. Thus the companies selling coal at less than $3 averaged 28 cents a ton profit, whereas the last group averaged $6.67 a ton.

Where Money for Coal Goes

THE last group, however, includes producers of special purpose, very high-grade coal, which commands a premium in any coal market, and because of the higher quality of this product, producing costs are relatively higher.

The margin between cost and selling is not net profit. "Sales realization" over mine costs is what determines average profits.

The writer has visited the main anthracite and bituminous mining districts of the East. To hear the operators, coal is being sold at a loss. To hear the miners, they work at a loss. The ultimate consumer, who studies the problem from the standpoint of what he must pay for coal, actually pays the operators for excessive overhead due to unscientific organization and distribution and the miner for more or less enforced idleness. The number of miners that could normally be kept employed every working day in the year need not be as many as are enrolled. The labor of an excessive number of men sporadically employed cannot be stretched to provide liberal living wages for all.

A great deal of the coal sold averages less than $1 gross profit per ton, from which must be deducted Federal and local taxes, borrowed money, investment, materials, supplies, general expense, selling expense, operating charges and wages. Wages is only one of the more than 200 items which the operator must pay to put a ton of coal in a freight car for shipment. Moreover, operators do not own the mines. There is such a thing as the coal landowner (the famous Girard estate is one of the biggest holders) or the mine owner, and not always are the coal landowner and the mine owner one and the same.

The middlemen that the industry must be rid of are of two kinds—speculators and local "dealers."

Before taking up either group a word of explanation is necessary in behalf of the legitimate broker already referred to. A coal mine is a ponderous and unwieldy industry. Its profits depend upon knowing extent of production and marketability. A mining company could not possibly hope to sell to consumers directly, or even to retailers directly. The items would be too fractional and involved. Even wholesalers in the smaller communities would be unable through local orders to make much of a dent in an operator's output unless the latter belonged to the wagon-mine class or in the baby-mine class.

The operator wants to know, as a good business man, how much he can sell and at what price. This knowledge is desirable before production rather than afterward. It is, therefore, the duty of the big wholesalers (distributors) on their part and brokers of a kind on their part to order what they require. The wholesale distributors differ from the brokers in one sense only; that the distributor actually buys the coal and handles it and screens it and delivers it, whereas the broker seldom sees the coal. He buys a given quantity and in turn accepts orders for the same, plus a margin for his trouble.

The evil, however, begins when what may be termed the wholesale or primary broker splits his order and sells to other lesser brokers for resale as the market may absorb, each reconsignment, of course, meaning a heavy commission.

In 1920 the coal production of the United States was: 89,000,000 tons of anthracite and 557,000,000 tons of bituminous coal. Of this, roughly, 48 per cent was used by the industries (coke included), 25 per cent by transportation systems, and the balance for domestic, gas and export purposes.

A large part of this coal is "contract coal," which means a price that was jointly considered fairly reasonable at the time the contract was made, but may be less or more than current market price of coal. Sales price at the mine, and "spot coal" are both higher than contract prices. Railroads and industries take nearly all of the contract coal, and among these there are concerns that under favorable circumstances get coal at less than cost, whereas the small consumer must pay more.

But what happens? Do all contract purchasers get their coal under the terms of their contract? No, especially in times like the present. Important concerns are unable to obtain their contract coal from a given source but can get spot coal—which means a higher price—from the same source, or a source not far removed.

Under the present arrangement, with numberless brokers taking their meed from each transaction, coal prices have skyrocketed, and one thing is evident—that current quotations are out of all proportion when compared to average f.o.b. mine prices. Do brokers get it all?

Let's take the case of John C. L. Ritter, of Washington, D. C. Mr. Ritter, who was a builder of vans and automobile special bodies, decided to go into the coal business a short time ago. Because he sold thousands of tons of coal at almost two dollars less a ton than the price "fixed" by the retail dealers of Washington, he was frozen out of his lucrative business—and lucrative on the basis of reasonable profit.

Mr. Ritter at first bought from local wholesalers, but gradually found his sources of supply being curtailed, all the while checked up by "individual members" of the retail dealers' association, every one of whom urged him to raise his price to the association figure. In due time Mr. Ritter was compelled to go to the mines direct to get his coal but even these failed him, and eventually he was obliged to call on individual small-scale operators whose output was of an inferior quality. The two or three big wholesale and retail dealers of the capital, without actually showing their hand, were enabled to control the situation either by virtue of their influence or their buying power.

If Mr. Ritter in a year was enabled to work up a demand in excess of 50 000 tons of coal for several reputable industries and hotels of Washington and felt that he was amply repaid for his efforts by demanding $6.95 a ton against the association price of $8.75, it is evident that association dealers have been mulcting the public in their city to the extent of $1.80 a ton.

The retail dealers' association is not made up of brokers, but of actual dealers, some very modest dealers among them, who sold coal in fractional parts, even by the bucket or bushel. It is clear that the association price is arrived at by some sort of an agreement, no matter how informal, but certainly very potent if it can "kill" an aggressive dealer like Mr. Ritter with so little ado.

And the People Pay

SOME of Mr. Ritter's testimony was before a Congressional committee, and it looked as if on the face of it evidence of conspiracy and price-fixing in restraint of trade would have justified further proceedings.

It is beyond doubt that similar combines exist in every little and big city in the United States. Of course, the dear public pays.

What Mr. Ritter refused to add to the selling price—$1.80 a ton—represents for the association dealers a superprofit, because the former's profit was included in his rate of $6.95. Upon a business of more than 50,000 tons the difference involved was about $100,000—a no mean sum, which in the pockets of the association members, where it now goes, penalizes the coal industry by so much in the public mind of one city alone! Under the circumstances it would be unfair to assume that all the profiteering in coal is done by brokers. There are brokers who perform legitimate work in this sense; they seek countless orders, and enable the mines to work with a fair degree of security. They are guarantors of sales to the mines. As these brokers—they are very few but they exist nevertheless—consign loaded cars from mine to consumer, they act as wholesalers. Of course, they get a commission, or in most cases sell at the best fair price that which they were enabled to contract for at the mine at lowest cost. If such a broker did not exist, no saving would follow, because either the operator would have to provide a sales organization, or the regular wholesaler would displace the broker. And this much is clear—that *wholesalers without storage facilities are perhaps worse than mere brokers.* The wholesaler with facilities for 1,000 physical tons of coal a year is likely to speculate if he handles 10,000 tons on paper.

Whether it is possible by law to reach the middleman, whether dealer or broker, is conjectural, since there are always ways to operate within the law or devise new systems.

It is, of course, imperative to destroy the profiteer, under either of those guises, who pockets from $1 to $3 a ton for no other work than to order so many cars

The Wicked mans [illegible]

OR

A SERMON

(Preached at the Lecture in Boston in New-England the 18th. day of the 1 Month 1674. when two men were executed, who had murthered their Master.)

Wherein is shewed

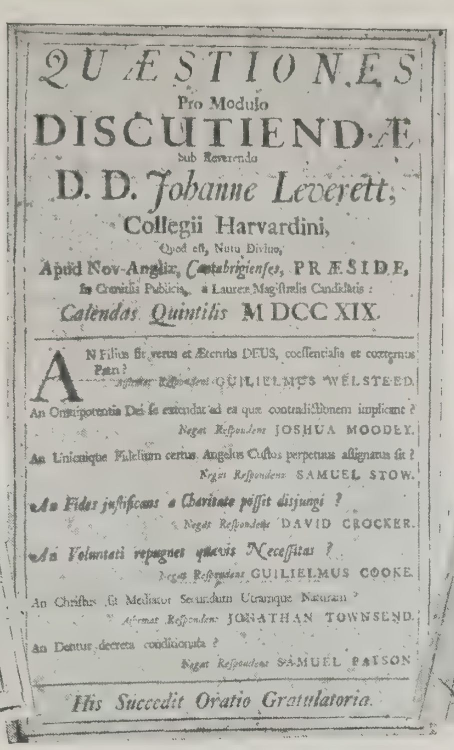
That excesse in wickedness doth bring untimely Death.

[illegible]

BOSTON,

Printed by John F[illegible]. 1675

A sermon by the Rev. Increase Mather, a famous Colonial minister. It was preached at the execution of two indentured men for the murder of their master and was printed in 1675. The subject was, "That Excess in Wickedness Doth Bring Untimely Death."



QUÆSTIONES

Bay State Houses Richest Collection of Americana

By F. N. HOLLINGSWORTH

PROBABLY the greatest and most valuable collection of Americana in existence is housed in the home of the American Antiquarian Society at Worcester, Massachusetts. After more than a century, the Society has a majority of the examples of material printed in America prior to 1824. Many historians have worked from the Worcester collection and George Bancroft, the great American historian, Professors Hart and Channing, of Harvard, James Ford Rhodes and John Bach McMasters found access to the collections greatly to their advantage.

In the collection is a copy of the "Book of the General Lawes and Libertyes," compiled from the records of the General Court, as the Massachusetts legislature was then and still is called; the first book printed in America, a sermon by Increase Mather; and a copy of John Eliot's Indian Bible, one of the first products of the Cambridge Press. Other gems are a copy of America's first newspaper, the Boston *News-Letter* and the first New England primer, "The Protestant Tutor," which is the only known copy in existence of the American edition of this book.

The volumes, broadsides and other material are splendidly housed in a fine, fireproof building with a capacity of nearly 300,000 volumes. Many lines of work are being carried out daily in this building, all directed toward an ultimate realization of the Society's aim that nothing that was printed in America before 1820 shall be absent from its shelves, if it is possible to obtain it.

The date 1820 was selected as the latest date, because in most of the larger towns of the country, printing presses had been established before that time and because it covers a large part of the most important and interesting events in the formative period of the country's history. Estimates seem to warrant that before 1820 there were printed in the United States about 75,000 titles of books.

One great undertaking on which the Society is still at work is a compilation of a list of all the newspapers that were published in America up to 1820. This list will contain an historical sketch of every paper dating between 1690 and 1820, with the title, date, name of the editor or publisher, the frequency of issue and other facts of importance, which are now known by only a few scattered issues. In addition, files of all such papers in libraries will be listed, and a complete check list kept of all copies in the Society's collection. These latter are bound in handsome style and kept in fireproof vaults, but instantly accessible.

The great John Carter Brown Library at Providence, now the property of Brown University, is noted as a great library of Americana, but it is only 50 per cent as complete as that of the American Antiquarian Society. Those of other great institutions, such as the Library of Congress, the New York and Boston public libraries, are below even the percentage of the John Carter Brown collection.

Organized in 1812, the American Antiquarian Society had its birth in the famous old Exchange Coffee House, Boston, and Dr. Isaiah Thomas, a printer, was its first president.

Another part of this collection includes old printed songs and ballads of 1812. Every victory of that war had its song, an elegy on the death of Lawrence and songs on the battle between the *Chesapeake* and the *Shannon*, the story of the *Java*, the *Enterprise*, the *Constitution* and the Battle of Lake Erie. Nearly every broadside of these songs, which were generally printed in that manner, carries a woodcut of the ship.

On a title-page of a bound volume of these broadsides appears an autograph statement by Thomas that his own collection, now owned by the Society, had been purchased from a ballad printer in Boston and bound up to show what "Articles of this kind were in vogue with the Vulgar at this time, 1814."

Among the treasures locked upon screened shelves is a series of Indian tracts of rare value. One little book contains a copy of Thomas Shepard's "Sincere Convert," translated by John Eliot, for which Isaiah Thomas paid 50 cents, but for which collectors would pay almost any price asked, if obtainable now.

The collection of early schoolbooks is unequaled anywhere, approximately 7,000 volumes in all. There is a remarkable shelf of old shorthand books, and the finest collection of old arithmetics in existence. Also, the Society is rich in old almanacs. There are some in German printed by the old Pennsylvania Germans at Philadelphia, Lancaster, Reading and Somerset. There are splendid specimens of early printing with woodcuts, and rubricated titles. These show a high degree of scholarship in both the authorship and the printing.

A few years ago the society acquired a rich collection of early American bookplates, many of them interesting, with Revere & Hurd (Paul Revere) as the chief makers. Almanacs were printed in America even before the "Bay Psalm Book," but no copies of these early almanacs are known to exist, and anyone who can find a copy can get thousands of dollars for it. The earliest extant American almanac is that of Samuel Danforth, printed in 1646, contained in the Henry E. Huntington collection. The earliest almanac owned by the American Antiquarian Society is "An Almanack for the Year of Our Lord 1656, by T. S.," printed by Green of Cambridge in 1655. This is the only known copy of this work.

This library is a storehouse of American life, history and customs, as set forth by the printed page unequaled in America, and impossible of duplication if millions were spent to do so. Yet it is free to the historical student and researcher who wishes to avail himself of the opportunity to work among these treasures.

Proud Cattle Families in the Blue Grass

Herefords Finally Break Into Exclusive Kentucky Breeding Circles

By HARRY E. BARNET

Above—Woodford 61st, of the Kentucky Woodfords, you know. Below—A herd of rising young heifers on the Hereford Farms.

SEVENTY-FIVE years ago, cattle fanciers from everywhere began to seek leaders for their herds from the Blue Grass of Kentucky. At that time it was a pure-bred cattle country, as well as a country of spectacular horses. And it was up in front with numbers and quality. Later, the West took away the advantage of numbers, but quality remained. There has been no let-up to the business of furnishing herd leaders to cattle fanciers.

Glory, and with it constructive economic progression, came into the industry when cattle families were established. The plan was simple. Sires and matrons with rare qualities were assembled on immense estates, and given family names. Their progeny inherited these rare qualities. For this reason, the members of Blue-Grass cattle families are as aristocratic as are the human heirs to the soil. When they are sold and taken into all parts of the world where love for a good animal is uppermost, the qualities of trump ancestors are passed on by their descendants. Moreover, as a romantic fact, it is easy to trace through the histories of these families a sort of a parallel to the handicaps and the triumphs of men and women who made the original Caucasian Blue-Grass record.

The top crust of this progression is the "Woodfords." Any story about them merges all there is to say generally about the manner of origin, the surroundings, and the treatment of cattle families. And, because of Woodford ownership and environment, as well as the history of the breed, there is plenty of individual dash as lagniappe in the story.

To begin: Woodfords are Hereford cattle. They exclusively occupy Hereford Farms, near Versailles, in Woodford County. The owner is Colonel E. H. Taylor, Jr., of Frankfort, himself one of the last of the sturdy and picturesque Blue-Grass Colonels. Whatever he does is planned and finished substantially. When he was well over 80 years old, Colonel Taylor founded the Woodford cattle family, and he has looked after it through a period of nearly 10 years. As for Woodford County, from which the cattle family gets its name, years ago Senator Blackburn said it is the asparagus bed of the garden spot of the world. At any rate, if you can honestly say, "I'm from old Woodford," you can go as far as you like in the Blue Grass. This boast is for animals and human beings.

Herefords had the most trouble getting a foothold in that country. North of the Ohio River they did very well. New England and Illinois, as an example, favored them. Elyria, Ohio, was known as "Herefordshire of America." But for a long time Herefords could not cross the Ohio River to colonize on the south side of it. Tradition and temperament in the Blue Grass favored Shorthorns, which gave other breeds a slim chance to nose their way in. Henry Clay tried to go against this current in 1817. He imported the first Herefords of which there is record, and put them on his Kentucky farms. The herd was crossed with Shorthorns, and lost sight of, because there was no way of keeping it intact, except by inbreeding.

About 50 years later, Cassius M. and Brutus J. Clay, who were Shorthorn enthusiasts, challenged William H. Sothern, a Hereford breeder, to a breed contest. The Clays failed to back their challenge. Nevertheless, Sothern brought 14 Herefords to the fairs at Lexington and Louisville. Special classes were made for the visitors, and some prizes were hung up for them. They won these prizes, because there was no competition. Personally, Sothern received all the courtesies that go with Blue-Grass hospitality. But as a breed, his cattle were merely tolerated at the fairs. They made one dent in the opposition they faced; Robert Wickliff, of Lexington, paid $100 for a yearling bull.

The next big attempt to settle the breed in the Blue Grass was in 1886. Illinois breeders took Herefords to the Shelbyville and Lexington fairs. As a matter of courtesy, a few prizes were offered, and won by the cattle. But the idea that Herefords ever would amount to anything in that country was considered a huge joke. No Kentuckian with enough standing to command respect for the breed would have anything to do with it. In that spirit, a Hereford bull, watch-charm size, was made of silver, and given to one of the exhibitors as a souvenir.

Herefords were back the next year. Fifty of them stayed in the Blue Grass. About the same time, Colonel W. H. Curtice, of Eminence, bought a registered Hereford bull. Colonel Curtice had the prestige that made the breed respected, and for 20 years he upheld it. Other stock raisers came gradually from behind the prejudice against Herefords, until Kentucky became noted for them.

When Colonel Taylor paid $12,400 for Beau Perfection 24th, a bull of the Curtice herd, in 1914, the breed went headlong to notoriety. This was the highest price ever paid for a Hereford on the American continent. The name of the animal was changed to Woodford 500,000, and he was settled on Hereford Farms to be the head of the Woodford cattle family. The matrons were daughters of the greatest sires of modern times. They were assembled from American and foreign herds. During the World War, when ocean travel was most hazardous, Imported Renown, said to be the highest type bull ever produced in Herefordshire, and 41 others, some from the king's herds, were brought to the United States by Colonel Taylor. These cattle were absorbed in the Woodford family.

Hereford Farms and the Woodfords represent an investment of more than $500,000. In the matter of bringing returns, the Woodfords have not been idlers. Four years after he established the family on Hereford Farms, Colonel Taylor held in a circus tent, seating 2,000 cattle fanciers, the largest auction sale of beef cattle on record. At that time, a cow from the family was sold for $13,850, a price yet unmatched; and 62 Woodfords were sold at an average of $3,010 each. A son of Woodford 500,000 has been sold for $15,100. At the sale, hundreds of men who were accustomed to attend auctions of blooded cattle, and to buy sires and matrons to mingle with their herds at what they say are "reasonable prices," sat on the circus seats without uttering a word. The prices were far beyond them. The significance of these figures is this: any cattle family can beat a record price paid for one or all of its members, if the owner has the means to do this, but when that same family tops all selling records you have something entirely different. There is a romance of animals in that

A herd of heifers posing for the camera man on the Hereford Farms, at Versailles, Kentucky. It will be noted all are too well-bred to continue their luncheon while being photographed.

country you'll find in no other region. It comes out of a whim of Nature, when she made the Blue Grass—Nature, in a word, fashioned it to be a roomy animal pattern shop. That is to say, the climate, the water, and the soil there produce a good creature, whether a horse, a cow, a sheep, a hog or a fox hound. This is a point about the Blue Grass that is new to the average visitor, because the prominence of Kentucky horses has overshadowed details about other animals.

In the case of Woodford 500,000, his potential value at the time of his death was estimated to be $200,000. When he died the event was of sufficient importance to be sent as news throughout the world. His body was casketed in a manner appropriate to his qualities and his fame, and buried beneath a big tree in the front lawn of the mansion house on Hereford Farms. A slab of finest marble, big enough to cover the grave, and deeply carved with the name of Woodford 500,000, a list of the prizes he won, followed by the main events in his life, will shortly be erected with ceremonies, and in the presence of dignitaries, similar to those that attend unveiling a monument to any dead.

"Woodford, the admiration of international Herefordom, is dead at seven years of age," the obituary of Woodford 500,000 begins. "Marked even from his very birth for distinction . . . . flying constantly at every step of his career the banners of distinguished individual destiny, he perished in majestic isolation on October 3, 1918, in the dead of the autumn night, enveloped in the giant flames which burned to the ground the magnificent barn Colonel Taylor had recently erected as a fitting home for him.

"Though Woodford is indeed dead at seven years, he passes in the fullness of fame—a fame that reaches from the Blue Grass to the pastures of the Wye and the Severn; from his native country to the land in which the breed first struggled for that type which has come into its own in America, and found in him its noblest expression.

"Bulls are noted for this virtue or that. Woodford seemed beyond faulting. No artist could improve upon his head and neck. His strong back and loins and rump were as smooth as could be produced by the chisel of a sculptor. The white upon his head and crest and bosom were like silk. His horns were perfect, and combined grace and beauty that fascinated with a masculinity that dominated his whole tremendous impressiveness. He was a bovine Apollo, worthy of the honor which has been accorded him by the agricultural colleges of the country that have his picture hanging upon their walls.

"Woodford, the wonderful, is gone. Lord Wilton hails him on the Stygian beach. Anxiety 4th raises his head in the Elysian fields to greet his peer. The Grove 3d and Garfield gaze on his majestic form and feel his brotherhood. Sir Bartle Frere and Fowler and the mighty group make room for him in friendly comfort, for Woodford has joined those marvelous makers of the breed in the untroubled meadows of eternal fame."

Above is a view of Hereford Farms with stone bridge hidden beneath rose blooms. In the circle is Col. Taylor, 88 years old, famous among other things for his fine Hereford cattle.

Homes of cattle families are dramatic contrasts. That is to say, things very old, and characteristically Blue Grass—yet, for the most part dapper—neighbor it with things so modern that the exuberance of their youth beside sedateness hits you a sharp blow in the eye; for instance, the stone fences.

Before the war between the states, the spare time of slaves was taken up by gathering from Blue-Grass fields flat pieces of rock—not bowlders—averaging, if they were exactly squared, a foot to 18 inches on any side, and ranging from an inch to four and five inches in thickness. These pieces of rock were laid flat on one another in a row two or three feet wide, and about waist high to a man of ordinary stature. Surmounting this row, flat rock pieces were piled diagonally, thus making a fence. These fences are typical of the Blue-Grass country. They mark the boundaries of estates there, and divide them into pastures and cultivated lands. Near Danville is a stone fence of this kind that is unbroken, except by gateways, in a distance of seven miles. No binder, such as cement or mortar, was placed between the rock pieces, but so carefully were these fences put together that only within the past few years have they begun to deteriorate. In place of repairing these picturesque boundary lines, a good many farm owners are selling them to road builders, who crush the rock to make fancy thoroughfares. Wire fences replace some or all of the stone structures. This, as passing comment, is one of the details among the many that are doing away with the old-time look of the Blue Grass.

Again, description must come back to the home of the Woodfords.

Hereford Farms is an estate of 2,200 acres, made up of 13 smaller farms purchased from various owners. The stone fences separating and dividing them were preserved in the original wherever this was possible. In other places the fences were rebuilt, the rock pieces bound with cement, and the joints pointed with mortar. The various homes on the farms were repaired where necessary without sacrificing the original outlines and character. The home of the foreman is more than a century old. It is a typical "mansion house" of the Blue Grass.

Entrance to the farms from the pike is between high stone pillars, another Blue-Grass characteristic that is slipping slowly into oblivion. Time was when pillars were at the entrance to every Blue-Grass farm, because they meant its owner and his family were "folks," even though the pillars were insignificant piles of stone. But even on Hereford Farms, stone fences end abruptly, and wire fences pick up the boundary lines, and follow them.

Hereford Farms resemble the skyscrapers, one-story buildings, and all-height structures of a modern city. There are hills, and little rises, and deep valleys, but there are no raw places. Rich blue grass capsules the crudities. Springs are the headwaters of innumerable brooks. Macademized roads ribbon the green surface of the farms. Clumps of wild flowers appear, wave a high-colored welcome, and are gone as you ride along these roads. Where nature is handicapped, what might be unsightliness is masked by the work of Colonel Taylor. An instance: On the boulevard, which is Blue-Grass talk for the roadway leading from the pike to the mansion house on any farm, is a stone bridge over a brook. With the exception of the ends of its stone pillars this bridge is hidden beneath trailing rose bushes, as carefully looked after as if they were on the lawn of "Thistleton," the Colonel's home near Frankfort. Relieving the monotony of green smoothness are little natural forests, and groups of nut-bearing trees, planted to provide shade for the Woodfords. The soft-tone red and white of Hereford groups is the last touch to the panorama.

While the original boundaries and divisions of the 13 farms included in Hereford Farms were practically undisturbed, additional paddocks and pastures of varying acreages are inclosed. Barns are placed in advantageous places. The interiors of these barns are divided into roomy box stalls for the matrons and their calves.

There are concrete bathing tanks near the barns, and each paddock and pasture is provided with water tanks, so that the cattle take no chances drinking from flowing streams. Water is pumped from the springs to these tanks. The principal spring is located beneath a stone house, built in 1819, since put in good shape, and used as the office building. Water flows from this spring through a pipe into a big tank.

This care for Blue-Grass cattle families is not an impulse; neither is it a contest between owners as to which one can build up the showiest spectacle. It is planned in cold blood, simply to raise two pounds of beef where one pound of beef was raised before. Contentment is as much a part of this result as good food or sanitation. Beautiful surroundings are a help. The Woodfords are not dairy cattle. Their members are bought to improve range herds and other herds in this country and abroad. When a calf is born, it is turned over to a nurse cow as soon as possible, and after that time the mother's milk supply is reduced, and soon ceases. In other words, Hereford Farms is devoted exclusively to the production of cattle which upbuild the breed.

Entrance from the pike to the Hereford Farms. No Blue-Grass estate is complete without its stone pillars.

Are the Bankers Reliable Public Educators?

Once Before They Undertook to Mold Public Opinion, and Did It

By W. H. ALLEN

ACCORDING to a statement in the New York *Times* (July 12) a country-wide campaign designed "to warn the American people against the printing-press money theories recently propounded by prominent men" is to be undertaken by the American Bankers' Association. *Though started in Chicago** this movement is really of eastern origin and the principal organizers are New York bankers. These bankers look upon the new plans for currency reform as a menace to our gold standard policy. They hold up the gold act of 1900, which they foisted upon us, as proof of their financial wisdom; and exploit the panic of 1893 as a warning against the evils of silver and currency inflation.

The banker's theory of the cause of that panic was widely exploited at the time and was the chief factor in influencing legislation for the repeal of the Sherman law and the adoption of the single standard. But certain facts which came out later throw a new light on the matter, and prove beyond all controversy that the arguments which the bankers used to discredit the Sherman law were absolutely false.

The campaign of education for the gold standard was really started with the attack on the Sherman law. Gold had been going abroad for several years previous but at first there seemed to be much uncertainty as to the cause of its going. This is shown by the statement in the New York *Advertiser* (March 10, 1893) that "It is probable that 99 men out of 100 have but little idea why gold is being shipped abroad in such vast quantities in these last three months. In the average mind the question, Why is it shipped, and what is given in its place? must naturally arise. As to the theory that foreign liquidation might explain the movement the *Advertiser* states that at that time "not a single American security was being realized upon, and yet every week saw some steamers sail away with millions of our gold." But later on when signs of trouble began to multiply, the theory, that foreign liquidation on account of our silver policy was the disturber, was started on its travels and has been kept going ever since. Foreign bankers started it, financial writers gave it publicity and the scientific economists and university professors added their unqualified indorsement.

Professor J. Laurence Laughlin in his "Principles of Money" says: "Again in 1893 a money and banking panic overtook the United States, due to fears that then existing acts of Congress would bring in the silver standard. Foreigners sent our securities home to be sold to obtain gold if possible before the coming of silver payments. The mere fear of a silver standard caused a rush of liquidation."

To the same effect Alexander D. Noyes says: "It was through these eastern banks that the 'run' began with 1893 on the government's gold reserve for the redemption of legal tender notes. It was on the eastern stock exchanges that foreign investors for two years continuously poured their holdings of American securities."—*Political Science Quarterly,* March, 1894.

Again in his book, "Thirty Years of American Finance," the same writer says: "And back of all the superficial reasoning of the day the unwelcome conclusion began to force itself forward that the gold expulsion was an index as truly as the gold expulsion of 1862, to a disordered and inflated currency."

But They Didn't Look Up Facts!

PROFESSOR LAUCK, of the University of Virginia, who has discussed this question very fully, asserts that the liquidation took place in 1892 and 1893, and that it was due to the Sherman law. The $59,000,000 gold exported in 1892 calendar year went to cancel returned railroad securities.

The general opinion was that this foreign liquidation took place on the New York Stock Exchange and that the bulk of it was for account of English investors. Mr. N. T. Bacon, a recognized authority, writing in the *Yale Review,* November, 1900, in reference to liquidation and losses by English investors, says: "But it is probable that their heaviest loss was in the panic of 1893, which was immensely aggravated by their dumping all manner of securities on the New York Stock Exchange for anything they would bring."

It is a curious fact that while all these experts were so cocksure that there was an immense liquidation in 1892 and 1893, and that it took place on the New York Stock Exchange, not one of them seems to have taken the trouble to look up the facts. Professor Lauck has devoted more space to this question than any other writer, but he does not seem to have the remotest idea of what stocks came back or whether they were sold on or off the Stock Exchange. He frequently refers to the *Financial Chronicle* as his authority; but that publication does not appear to know any more about the matter than the professor does. To my request for information the *Chronicle* replied as follows:

"In answer to your inquiry of the 18th, we beg leave to state that we cannot now give you the names of the banking houses which sold more of our securities for foreign account than they bought during the months preceding the panic of 1893 or what securities came back. It is a well-known fact, however, that European holders of American securities were alarmed at the results of our silver legislation and that they sold these securities freely presumably on and off the Stock Exchange. Sgd., William B. Dana Company, by Geo. B. Shephard."

Professor Lauck also quotes the London *Economist.* But neither does that authority say where the liquidation took place.

Failing to get any exact information from these sources, I decided to do a little investigating on my own account. Messrs. Noyes and Bacon having stated that the liquidation took place on the Stock Exchange, I looked up the reports of such business for foreign account in the *Evening Post* and other New York newspapers. Here are the transactions for foreign account in each month of these two years.

Excess of Purchase Shares

	1892	1893
January	89,000	61,000
February	33,000	97,000
March	11,000	68,500
April	95,000	86,000
May	103,000	140,000
June	34,000	45,500
July	8,000	95,000
August	13,500	107,500
September	31,500	5,000
October	61,000	*15,500
November	69,000	40,000
December	43,500	76,000

Net excess of purchases for 1892 591,500
Net excess of purchases for 1893 821,500
*Shows excess of sales.

These figures of transactions *inside the Stock Exchange* certainly do not indicate a dumping of securities.

Now as to what was transpiring *outside the Stock Exchange,* this is the account of transactions as far as I could find them.

For the year 1892. January—15,000 shares of Louisville securities shipped abroad. February—Foreigners bought $400,000 worth of Atchinson incomes. Kuhn, Loeb & Company, loaned $1,000,000 (foreign money) to Norfolk and Western. "If Europe has been selling this year it has not been done in the open market."—(*Post,* February 10.) April—Heavy buying of bonds for foreign account. Also large blocks of Reading and Atchinson railway bonds. German bankers buy $6,500,000 worth of Ontario and Western bonds. Foreigners buy Philadelphia sugar mills. London buys $2,000,000 worth of Atchinson bonds. June—Bank of Montreal buys 3,000 shares of Lake Shore. August—5,000 shares of Laclede Gas Company sold abroad. September—Heavy buying of bonds for foreign account. Nashville & Chattanooga bonds bought for English account. Heavy buying of Reading Incomes for London. October—*Post* predicts gold imports because foreigners had bought considerable bonds. November—Much Reading and Atchison bonds bought. December—Speyer sells 5,000 shares for foreign account.

For the year 1893—Transactions outside the Stock Exchange. January—Speyer & Company (foreign banker) loan $6,000.000 on Reading Railroad trust bonds. "Foreign houses report a steady demand from abroad for high-class bonds yielding fair returns which are shipped from here as soon as the orders can be filled." February—"Houses with large foreign connections report a brisk movement in bonds and dividend paying stocks for European investment account. It is said that they have shipped from $500,000 to $1,000,000 worth of bonds, on each of the steamers leaving last week."—*Post,* February 1. "One gold exporting house reports that it would ship $2,000,000 worth of stocks instead of gold."—*Post,* February 16. "Foreign houses continue their purchases of bonds." April—Panama railroad stock offered in Paris at $50 a share. May—Speyer & Company buy $4,000,000 worth of Pennsylvania Railroad bonds. July—"Large amounts of stocks and bonds are known to have been bought within the last few days for foreign account."—*Tribune,* July 28. "The only elements of strength to the market was the buying of London."—*Tribune,* July 27. "A large amount of stocks estimated at 100,000 shares will be shipped to London by Saturday's steamers."—*Post,* July 27. "On the Stock Exchange foreigners bought everything in sight."—*Press,* July 27. There is not one report of foreign liquidation in such volume.

The panic came on July 26.

There was still heavier outside buying after the panic but I am only concerned with what happened before.

In view of this showing the question suggests itself, Where did these parties get this theory of foreign liquidation? Professors Lauck and Laughlin and the *Financial Chronicle,* as we have seen, got their authority from the foreign bankers. But Mr. Noyes also quotes W. C. Ford, Chief of the Bureau of Statistics, who in his annual report estimates the net purchases of stocks for foreign account in the fiscal year ended June 30, 1893, at $100,000,000. Where this liquidation took place is not stated. But my reports show that in this same fiscal year the net foreign purchases totaled 743,000 shares, nearly 600,000 of which were taken in the latter half of the period, that is, from January 1, to June 30, 1893, and the biggest amount, 140,000 shares, was taken in May when matters were beginning to look serious.

Where the Gold Really Went

IF THE above named economists had studied the directions of the gold movement they might have found reasons enough to shake their faith in this liquidation theory. The banker's theory had it that most of the securities were returned by British investors. If this were so *the bulk of this gold should have gone to England.* But such was not the case. *The bulk of it went to Austria via France and Germany.* And yet Austria held none of our securities, but she did have a vast army of Hungarian immigrants here who were hoarding up millions and sending them home every year.

"The learned," says Elbert Hubbard, "can see everything but the obvious." Especially is this the case when they don't want to see it. Financial writers, public officials and others shut their eyes to plain facts and accepted the theory that silver and paper money inflation was the cause of all our woes! The big bankers, who are supposed to know it all (and to tell all they know), had originated this theory and the aforesaid financial writers and others accepted it as gospel.

In exploiting this theory the bankers had several objects in view. The first object was to hide the fact that the chief cause of the trouble in 1893 was these invisible foreign debts for alien hoards, tourists' expenses, interest dues, and cost of ocean freight in foreign vessels. The second object was to make silver and paper currency inflation the bogie and thus pave the way for the demonetization of silver and the establishment of the gold standard.

But the facts herein set forth prove that it is a brazenly false theory. It is refuted by these reports of foreign business in our stocks and also by the directions of the gold movement.

I have given a brief history of this matter in several magazine articles and its correctness has never been questioned, and it cannot be questioned. It is very essential that these facts of financial history should be recalled. For it is the same group that is now leading this new campaign of education to discredit financial policies which do not originate in Wall Street. Their campaign involves the same misrepresentation of facts. They proceed on the theory that "a lie well stuck to is better than the truth half told." And they will continue to hold up the crisis of 30 years ago as a financial bogie, and a warning against any plan of currency reform that may seem like a departure from the gold-standard policy as defined by the money brokers.

---

*Note:—This is a well-worn strategy and it indicates Wall Street's recognition of the distrust in which it is held by the country. It is common for a Wall Street scheme to be handled from rented offices in Chicago. The House of Warburg, for example, could tell several interesting stories of New York interests working out of Chicago to influence legislation at Washington—especially Federal Reserve legislation. It is proper to inquire how long Chicago will enjoy being a stool pigeon for a certain section of Wall Street.—Editorial Note.

You Want the Facts About Coal, Don't You?

Concluded from page 8

of coal at the mine and sell them to the highest bidder. It is a silent auction, because these profiteers receive orders by mail or telegraph, and they in turn can select the best offers.

An investigation throughout the eastern mine district, no matter how superficial, will convince any one that a *coal shortage is an impossibility.* Whatever of it exists is imaginary or geographical. I have traversed three or four coal states, and the most frequent landscape before my eyes was a vista of coal-laden cars on sidings that could not have been used very recently, if one judged by the rusty rails on which they reposed. It would be a good guess—and a better gamble perhaps—to say that for every moving coal-laden car there were twenty—

Yes, what are all these stationary cars of coal doing? How many are standing still for lack of motive power to move them? And how many are standing still because they are cars containing contract or option coal in the name of speculators who are waiting for the "right order" to move them along?

One hears the old singsong about car shortage, but is that as real an evil as it is made out to be? There are many idle empty coal cars on every line. Is normal traffic impeding their movement? Who owns or leases them—and who controls their destiny? There are not so many such empty cars now as in the spring or early summer—but there are certainly enough to make these questions pertinent.

When this follows then the "snowbird" mine is developed—small mines making a profit under these favorable conditions which in turn breed a flock of "snowbird" brokers.

If so conservative an authority as Dr. Smith declares it to be his opinion that too many mines and too many miners are operating today, it is to be concluded that *there can be no coal shortage.*

It is my belief that much of this surplusage of "speculation coal" is on the rails. "Dealers' bins" are empty or almost so. In a few cases they are empty because coal has been moved, but in not a few cases *they are empty because they were never intended to be full.* These "dealers' bins" are for effect.

The President in a recent letter to Conrad E. Spens, Federal fuel distributor, considers the coal problem as one of transportation rather than production. It is to be doubted if it is a problem of transportation. It is possible and probable that at given points given systems may have been unable to move all the coal in sight, but it is too much to ask one to believe that every railroad has failed in this, and that said failure, where it has occurred, was not based upon preference, profit or premeditation. It is part of a vicious circle, in which not everyone concerned is responsible—that is, operator, railroad, wholesaler, retailer—*but somehow somewhere somebody is responsible.* The condition is not one that "just happens" because it happens too frequently, too regularly, and always bears the same earmarks.

De-inking Newspapers to Save Our Forests

Salvaging of Print Stock by New Process to Relieve Paper Shortage

By FRED L. HOLMES

OLD newspapers will soon be used for other purposes than starting the fires in the country homes each morning, or filling office waste baskets which city janitors must lug to the paper press in the basement.

By a new discovery made at the Federal Forest Products laboratory at Madison, Wisconsin, old newspapers can be de-inked. Their preservation for sale will soon check the annual denuding of the forests of 5,000,000 cords of wood annually which when manufactured produces 2,200,000 tons of print paper to supply the news presses of the nation. The salvaging of old newsprints is expected to furnish relief to the present paper shortage.

The main building of the Forest Products laboratory. This and five other buildings are needed to house the experimental equipment of the laboratory, and its staff of 100 technical men and assistants.

Every year the pulp and paper situation in the United States has become more acute. Its products weave into every other industry and almost every other activity of the nation. Only a few species of trees are adapted to pulp manufacture. Discovery of new trees that can be utilized must be made and strong-arm methods of conservation must be adopted or peril lurks in the future.

Into this large vat newspapers are placed for the de-inking. Sidney D. Wells, the discoverer, is shown standing near the tub.

"Under present methods of converting trees into pulp this industry is dependent for its raw supplies upon three per cent of the standing timber remaining," says C. P. Winslow, director of the Federal laboratory, in the official records of the forestry department of the government. "This is due to the fact that present processes are commercially adopted to a very few species only. This accounts, in part, for the fact that the paper mill industry in the East and lake states faces exhaustion of local timber, and the future of the industry as a whole rests with new methods to conserve the supply of pulp by re-using old print papers and upon the development of processes which will make it commercially practical to use species other than those now being used, especially western woods which comprise more than 60 per cent of our remaining timber."

That authoritative statement summarizes the pulp-paper situation. It emphasizes the importance of any discovery which will make possible the reworking of present discarded paper stocks and wastes.

The process of de-inking is so simple that it can be utilized by every commercial newsprint plant in the country without the installation of a dollar's worth of new machinery. The old papers are soaked in water, run through a beater, like that operated in every paper mill, and then bentonite, the new American clay, is introduced. This clay acts on ink particles like a magnet on a horseshoe nail. It loads a particle on its back and floats it off through the waste pipe leaving the mushy pulp, restrained by sieves, white and clean. It gives at once an exemplification of the Biblical phrase "old wine in new bottles."

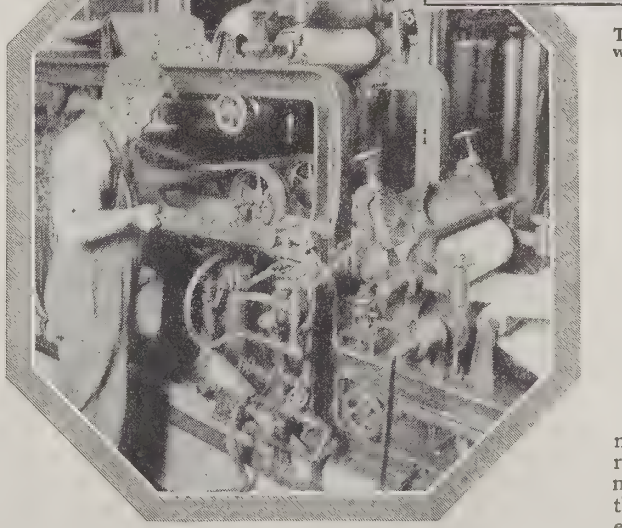
Bentonite is the new American clay which the laboratory heralded a year ago as a substance to give a fine enamel to book paper. It exists in large deposits. When this clay is used with English China clay, the retention of the English clay is materially increased, and the paper produced has a superior finish and appearance, and a more velvety feel. The admixture of this clay similarly improves the retention of other fillers, and is especially desirable with some which have a low retention.

For two centuries scientists have been attempting to find some process for de-inking newspapers. First mention of a process to accomplish this is made by George Balthasar Illy in Denmark as early as 1695. In 1765, Dr. Jacob Christian Schaffer mentions its use in his "Papier Versuchen."

"How did you come to make the discovery and what is bentonite," I asked Sidney D. Wells, engineer of the laboratory.

"We were making use of bentonite in experiments on book-paper enamel," he replied. "One day when some old newspapers around the office were being turned back into pulp I dropped some of this clay into the vat. This clay remains in solution a long time and seems to have affinity for ink particles. I noticed that clay particles would fasten to ink particles and when the pulp would strike the sieves, or skimmers, the clay and ink particles would float through, leaving the pulp behind. Down the waste pipe went the old ink. Here was the very process we had been attempting to discover for years.

"In de-inking printed paper, and especially newspaper, it is comparatively easy to loosen the carbon black by dissolving the varnish of the printing ink by means of alkalies such as sodium carbonate or caustic soda, using as little as 40 pounds of sodium carbonate to a ton of paper and temperatures as low as 120 degrees Fahrenheit. Such treatment will not injure groundwood pulp and if the carbon black could be completely washed out after liberation a satisfactory material would be obtained. Unfortunately, the fibers of the paper stock serve as a very effective filter to mesh the particles of carbon and there is no method that permits their complete removal without excessive losses of pulp or expenditures of time, power and water that are prohibitive. In fact, a point seems to be reached beyond which it is impossible to remove the remaining traces of ink. The problem is entirely different from the removal of solution impurities such as cooking liquor or bleach residues, and the successful methods for handling impurities do not answer the purpose. With bentonite, however, we have a substance that will pass through ordinary filters and carry the carbon black with it."



Paper mill at Forest Products laboratory used for experimental purposes. Old newspapers, de-inked, are being run off.

Before he went on with his story, Mr. Wells showed me a pile of creamy-white clay. That was bentonite from the beds of Montana and Wyoming. It is cheap, selling for $20 a ton. One ton of bentonite in solution will clean up ten tons of discarded and pulped newspapers.

"What kind of clay is it?" I asked.

"Bentonite is defined by the United States Geological Survey as a transported, stratified, volcanic ash that has been altered shortly after deposition," came the reply. "It is very fine-grained and has the property of swelling in contact with water to several times its original volume into a jelly-like mass which on further dilution forms colloidal solutions which will remain in suspension indefinitely in mixtures as dilute as one part of bentonite to 50 parts of water. It is a mineral akin to kaolin although generally yielding on analysis more silica, less alumina, and more magnesia, and has been found to be an excellent filler for paper. Its physical properties render it of most value in de-inking paper."

Comparative tests with an excellent deposit of Wyoming bentonite, English China clay, and Georgia China clay, in which one part of each was mixed in 100 parts of water, gave the following results on standing 24 hours:

	Parts remaining in suspension
Wyoming bentonite	.78
English China clay	.001
Georgia China clay	.01

This shows that bentonite remains in solution, while heavier clays settle quickly to the bottom, like sediment in an inactive pool.

The Forest Products laboratory, where these official experiments were conducted, is an arm of the Department of Agriculture. It was founded 12 years ago to devise means to check the wood waste of the nation. Forests were being denuded and the lumber supply was being rapidly exhausted.

"All told, we demand of our forests about fifty-six billion feet of timber annually, aside from more than one hundred million cords of small material for fuel and various chemical products," declared William B. Greeley, national forester, in an official statement at the laboratory recently. "There is nothing comparable to this enormous use of wood in the history of the world. We are pre-eminently a wood-using nation. It is wood that has developed our farm lands, that has largely built and equipped our railroads, and that supports many of our most valuable and distinctive manufacturing industries.

"We use from two to four times as much wood—for every member of our population—as the most highly developed countries of Europe. We cannot face the future without a sober and intelligent consideration of that fact. Three-fifths of the timber originally in the United States is gone. We are taking about four times the amount of wood out of our forests every year that we are growing in them. We are cutting more of every class of timber than we are growing. We are even using up the trees too small for the sawmills, upon which our future lumber supply depends, three and one-half times as fast as they are being produced."

Two handfuls of bentonite clay, creamy-white and porous, is the magic ingredient used in de-inking.

The Forest Products laboratory is the nation's scientific wood conservationist. For several years it was the only institution of its kind in the world. At the institution a corps of experts devotes its efforts to discover every possible use to which wood waste can be put. It has discovered that sawdust, when subjected to scientific cooking processes, can be utilized as an edible cattle food; that woods when properly seasoned have a longer livelihood; that certain treatments of creosote will preserve telephone poles and railroad ties and that packing boxes when correctly constructed stand up longer under the strain of shipments. Hundreds of similar discoveries, all tending to save the wood of the nation, have been made. The de-inking of old newspapers is the most important conservation innovation to be made.

Rising prices of print paper have been a nightmare to publishers. The discovery of de-inking will relieve much of the tension. Thousands of tons of old newspapers can be gathered in cities each month under the stimulus of a reasonable price. More efficient gathering channels of the waste product must be developed.

"The possibilities of a process for the recovery of old newspaper stock such as had been described are apparent to any one familiar with the paper industry," continued Mr. Wells. "When the price paid for old paper stimulated collection it is reported that about twenty-five thousand tons a month were collected in Chicago of which 40 per cent was news. In our metropolitan centers probably twenty-five hundred tons a day were collected which would furnish a very considerable portion of our daily consumption of approximately seven thousand tons of newsprint. The source is furthermore at the place of consumption and the saving in freight is a very important item. The color requirements of the publishers at the present time are very severe and any process that does not thoroughly remove the ink cannot be successful. While considerable difficulty was encountered in meeting these requirements the results obtained as the process has been finally worked out seem to justify our belief that they can be met."

A Sales Manager Said—"Work on Sundays"!

Concluded from page 2

Rt. Rev. Francis J. McConnell,
Bishop Methodist Episcopal Church, Pittsburgh, Pennsylvania.

Replying to your inquiry as to the social effect of Sunday business, may I say that in general I consider such business anti-social. I cannot satisfactorily define *necessary* business, but nothing is necessary which tends to rob the laborer of one day's rest in seven. The extension of Sunday work certainly tends to do that. My primary interest is in the extension of humanizing principles to industry, and the general extension of business to Sunday certainly would make for the de-humanizing of industry. In the essential tasks of communication and furnishing of food supply, the work of the laborer can be so adjusted as to give him one day a week, not so if everything is to be construed as necessary.

CHARLES E. LEE,
Consulting Engineer, New York City. Formerly General Superintendent of Boston & Maine Railroad.

Having been all my life engaged in conducting transportation, it is somewhat embarrassing for me to express an opinion on the subject of your letter. I have worked Sundays much of my business life. I do think there is more work done on this day than is necessary for the well-being of the nation, and am also firmly of the opinion that no good purpose is served by doing this unnecessary work.

1. I know of no specific instance where concerns are advising their salesmen to do business on Sunday.
2. I do not think unnecessary Sunday work pays in the long run, and the effect on society would be bad if this were to become a policy in business.
3. Necessary business is that work necessary to enable the masses to enjoy rest, recreation, and facilities for study on that day.

JAMES C. WILSON,
Vice-President, James S. Kemper & Company, Mutual Class Insurance, Chicago, Illinois.

It appears to the writer that this question, as well as all others on which business hinges, resolves itself into one of satisfying the buying public.

There are innumerable lines in which it seems necessary to serve the public on Sunday. None of these lines were in existence when the Bible was written, hence they could not foresee the necessity of electric lights, telephones, gas, transportation, and so on.

1. We know several business firms training men especially to handle Sunday business.
2. Our opinion of the effect on society in general of Sunday selling is that it is in keeping with the times, is beneficial to all, and that it pays.
3. Necessary business on Sunday means to us serving the general demand in whatever it requires.

MARSHALL N. DANA,
Editor, Oregon *Journal,* Portland, Oregon.

1. I do not know of firms that advise their salesmen to do business on Sunday.
2. "The Sabbath was made for man, and not man for the Sabbath." I think it would have an injurious effect on society to turn the seventh day over to business solicitation. I do not think that Sunday business in the long run pays.
3. My definition of necessary business on Sunday is transportation, communication and recreational operation. I believe that everybody ought to have at least one day's complete break from work in every seven.

L. S. GILLETTE,
President, Plymouth Investment Company, Minneapolis, Minnesota.

1. No.
2. Effect on society is bad, and the habit of making golf a business all day Sunday is bad. Its effect upon church attendance is particularly noticeable. Its influence upon the young is bad. It has resulted in disrespect of the Sabbath. Unnecessary violation of the Sabbath cannot be justified.
3. Necessary business on Sunday may be defined as such as could not have been done some time during the preceding week and cannot possibly be postponed until the coming week.

FREDERICK W. TAYLOR,
Agriculturist, Los Angeles, California. Chief Departments of Agriculture and Horticulture, Louisiana Purchase Exposition.

In the first place, I am not a preacher, nor the descendant of a preacher, so far as I know, in the more than a hundred lines that come into my nine generations of American ancestry.

All my ancestors are of New England, but I was born in the far West, as it was then, and have lived most of my life in the West, with a few years in the Asiatic Far East. So I have had a good deal of opportunity to observe.

Answering your first question, a great part of the sale in real estate, in and about Los Angeles, is pushed specially hard on Sundays, and I note a disposition to do the same in many other places, not only as to real estate, but in the case of almost any business with those who are engaged, regularly, during the week.

Second. My feeling, based on many years of observation and study of the question, is that the business use of Sunday is a mistake, from the standpoint of the seller, as well as of the buyer. And, in the long run, I cannot recall a single person or firm, following this particular form of hustling, who has benefited noticeably, if at all, by the practice.

They lose, without knowing it, much business from those who are not in harmony with the practice, their salesmen cannot keep in good trim without a day of rest, and the deadly and continuous grind dulls their faculties, and reduces their business acumen.

Third. I have not a specially clear idea as to exactly what is "necessary business," but I think that there is very little of it. Certain transportation, passenger and freight, as well as mail, may come under that heading, but I doubt whether a quarter of that used is really very necessary.

Newspapers are somewhat a necessity, but the hundred-page nightmares that we so often get, are certainly not a necessity on Sunday or, for that matter, on any other day of the week.

Hotels, restaurants and household activities are necessary to a proper extent, as probably is street car transportation.

I personally believe that practically all business should stop on Sunday, looking at it simply from the human standpoint, leaving out the religious question entirely. . . .

We all need more poise, more thoughtfulness, more of many qualities that can be got best, if not only from adherence to some religious teachings, and these things are not compatible with the rush and hurlyburly of seven days a week work. And the substitute of a rest day, other than a Sunday, does not fill the necessity.

WILMER W. SALMON,
President, General Railway Signal Company, Rochester, New York.

1. No.
2. Generally bad. Not enough data to warrant an opinion.
3. Transportation, hotels, drug stores, and so on.

JOHN H. GRAY,
Department of Economics, Carleton College, Northfield, Minnesota.

Any one who has studied the industrial and commercial life of this country since the cruel war, must have reached the conclusion that what is vainly called Commercialism has run riot. The human race cannot stand the pace for another fifty years. We must reform industry or industry will do our civilization away. It has destroyed family life, set up false ideas in the minds of the young, lowered the moral tone of business, and abolished Sunday. Sunday labor is merely one phase of this orgy. At the point we have now reached, unless one has some special privilege or monopoly power, he is driven out of business if he does not descend to all the tricks and wickedness of his worst competitor. This necessarily means Sunday labor, adulteration of quality, false representations, and other untold evils, including nerve-breaking stress.

You cannot say what is necessary Sunday labor for one man until you know what his competitor does on Sunday. But you may be very sure that we do more business on Sunday than is good for mind, body or soul—more than any civilized or Christian nation can do if it wishes to survive. Read the chapter in Sydney and Beatrice Webb's "Industrial Democracy" on the "Higgling of the Market."

H. A. WHEELER,
Vice-President, Union Trust Company, Chicago, Illinois.

1. No.
2. A business policy which advocates or requires Sunday selling lowers the moral standard of citizens. I do not think Sunday business pays in the long run.
3. Necessary business on Sunday embraces Transportation, Public Utilities, Food Services and perishable commodities.

H. E. HACKENBERG,
Assistant General Manager, Western Clock Company, La Salle, Illinois.

1. We know of no instances where firms are advising their salesmen to do business on Sunday.
2. The effect on society in general of a business policy that requires Sunday selling would, in our opinion, be harmful for moral and religious reasons. We think decidedly that Sunday business does not pay in the long run, not only because the human machine requires rest and repair and would, therefore, not render as good service if worked continuously, but also because Sunday solicitation would be resented by the buyers as soon as it became prevalent enough to amount to anything.
3. Our definition of necessary business on Sunday is business which, if not done, would result in a disproportionate loss. We might add that we do not work Saturday afternoons nor on holidays. We close our plant for two weeks in July and all employes who have been with us 10 years get paid for these two weeks. Those who have been with us five years are paid for one week. All salaried employes get two weeks vacation with pay.

The Myth of Henry Cabot Lodge Exploded

Concluded from page 6

committal" on great issues, that he is habitually trying to play both ends and the middle in his clamor for votes, that he refused to stand by the prohibition chief who did his duty as the law required. The purveyors of the Great Myth hail him as a modern Daniel fighting corruption in a lions' den. They acclaim him the living embodiment of the New England spirit of stern virtue, the defender of the Massachusetts tradition. And straightway his erstwhile opponents bow in obeisance. Verily, the Great Myth is mighty!

Like all well-trained politicians Lodge poses as a friend of Labor, but his long record in Washington does not disclose a single instance where he championed Labor's cause unless Labor's cause chanced by some twist of fate to be linked by a business boom with big profits and dividends for the Chosen Few of New England industry. He prates much on "international policies"—an abstract subject for a state campaign—but he is ominously silent on the coal situation, a vital question just now with those who labor. But that doesn't faze Mr. Lodge. What, anyway, are specific issues to a mental gymnast who is capable of jumping from generality to generality as a Cape Cod sand flea jumps from pebble to pebble? Verily, the Myth is mighty!

It has been said that Mr. Lodge has an inherited dislike for England. New England, being provincial, is slow to forget some things. Among them is England's attitude toward the Northern cause during the Civil War. She has never been fully forgiven for what she did nearly 60 years ago. The memory of it still rankles in the old boys who fought under Lincoln, although it doesn't much affect the younger generation. But the population of Massachusetts is represented heavily by Americans of Irish ancestry. This racial element is today essentially the Democratic party in Massachusetts. Wherefore Henry Cabot Lodge's dislike of England is not so much because he cherishes a spirit of antipathy but because the pretense of it is politically beneficial. It is his trump card, and he always has one up his sleeve. That is why he signed the protest to Lloyd George on behalf of the Irish people, the protest which Lloyd George replied to by telling the signers to mind their own business. His signing the protest could be easily explained to those who might object to his insolent interference or unwarranted meddling, or whatever you choose to call it, by the senior Senator from Massachusetts. The Great Myth would take care of it. The old war vets wouldn't be upset by it and it would please the friends of Irish freedom. Wherefore Lodge's heralded dislike of England. It helps to attract votes and votes for Lodge are what are needed every six years. The claquers are in a position to tell the Democrats how warmly Mr. Lodge's heart beats for Ireland, when if the truth were known Lodge wouldn't give a rap if England towed Ireland out to sea and sank her.

Lodge, the poseur, understands the power of suggestion. He knows the psychology of crowds. He knows that in our voting, for instance, we are moved as a nation by slogans. Lodge is cold and calculating. Indeed, some wag has described him as the Icicle of the North. He has no sense of humor but he has been taught by other men what most pleases and catches the popular imagination. He cannot sway great masses like a Borah or a Beveridge except when he is pleading for personal political sympathy. Anybody who tugs long enough on the heartstrings of human folks like New Englanders is sure of a response, and Henry knows how to make a 100 per cent plea for sympathy. When he talks straight politics he talks a language not so understandable, but he usually manages to throw a scare into his audience by ringing in the ancient full-dinner-pail argument so popular and effective in the national campaign 26 years ago. He cannot move large gatherings unless a brass band has first crashed down upon the audience and let loose the spirit of the bleachers. Getting ready for Lodge to speak is a work for cheer leaders and claquers. Mob psychology is always needed, and someone is sure to tell the story of the Great Myth.

It is not by the stature of a statesman that Lodge's political success may be gauged but by the subtle power of a fiction repeated often enough. That is why Lodge could vote to seat Newberry without qualms of conscience. The senatorial declaration that the spending of huge sums of money would in future be dangerous to the perpetuity of free government was intended as a sop for people who think. It makes no difference apparently to Mr. Lodge that the public sense of decency and honor has been outraged. The Great Myth will take care of that when the time comes. In this instance, as in many others, he has overlooked the fact that every political wrong is a social wrong and, therefore, a moral wrong. And he seems contentedly oblivious of the fact that responsibility for a political wrong cannot be evaded by a technicality. But that doesn't matter, for it will be taken care of by the all-powerful Myth, the Infallibility of Lodge. It was taken care of in the Republican primary campaign when Lodge's opponent, former Speaker Joseph Walker, of the Massachusetts house of representatives, called for an explanation. Lodge's vote on the seating of Newberry was all explained by Secretary Hughes, counsel in the case, and the pamphlet was sent broadcast throughout Massachusetts with Senator Lodge's frank upon it. Then, when the time came for filing primary campaign expenses, Henry Cabot Lodge reported that he had "spent nothing." This, too, helps us to understand Mr. Lodge's moral values as applied to practical politics. It helps us to understand Lodge.

So much in evidence to explode the Great Myth which paints Lodge in the mantle of the Immortals. Lodge is a product of a peculiar environment. He lives in the heart of New England, and New England, you must understand, to understand Lodge, is the healthiest country in the world for standpatters. It always was and probably always will be. But her prophets and not her standpatters are remembered. Her standpatters succeed because New England, unfortunately, is slow to move. She wakes up to honor her prophets long after they have gone, and not until the rest of the world has discovered their greatness. Massachusetts erects statues to her "dangerous men." Her standpatters creep into nameless graves and are remembered no more except for the evils they have done. When we recall that history has a way of repeating itself, we wonder what the verdict will be a century hence. And, too, we wonder what chance of immortality Henry Cabot Lodge will have in the shuffle.

The "Grand Old Man of American Fiction"

Concluded from page 7

mantic Arab, 'I silently faded away.' I had resigned my job and made a splurge on my own in California street, and while scarcely anybody knew anything about it, I was young enough to think they did. And I was too proud to accept the good jobs that were offered me; I was sore from soul to suspenders, and my bruised spirit sought surcease from woe by reviving my old boyhood ambition, to wit, authorship. There had never been any authors in our tribe, there had never been any soldiers, and there had never been any business men. I had tried soldiering and business, so why not try writing?

"I was still ill. I had a temperature. Perhaps I was excited. At any rate, I went home and, using an incident that had come under my notice in the shipping business, I wrote my first short story and called it, 'A Little Matter of Salvage.'

"I enjoyed writing it; to me it was almost real. But when I had typed it I knew it was a failure, because I was a failure, and nothing profitable could come out of my crazy head. So I tucked it away and took a job as assistant business manager to a syndicate of half-wits who purposed establishing a morning newspaper in San Francisco. They didn't have money enough to pay me my first week's salary! It's a fact. But they had youth and imagination and energy and courage, sans business ability, so they put it over, and we lived a dog's life for nearly four months. I worked in the business office by day and in the local room by night, for our reportorial staff was limited. With the glad abandon of idiots, we got behind a political cripple for governor and perished miserably with him. I remember that my first assignment as a cub reporter was to cover the Republican state convention that nominated his opponent. The other morning papers had four men each on the job, with automobiles and messenger boys; I played a lone hand and shorthand and used the telephone, and if my story suffered by comparison with those of my competitors, I never heard about it.

"In the meantime, however, owing to the difficulty of collecting my weekly stipend, I had resurrected my salvage story, rewritten it, and, with a sigh for the wasted postage, had mailed it to the *Saturday Evening Post*, which promptly accepted it and mailed me a check for $250 in payment of same. Inasmuch as I have always required more money than I have possessed, I soon wrote another story for the *Post*, and when they accepted that and still another, I concluded I was fixed for life. So I married and have lived happy ever afterward.

"When I lost my newspaper job I hadn't a penny in the world. That was the night of November 29, 1910—and our rent was due on December 1. We had a landlord who could be depended upon to call on the morning of that day. I had come home from the deathbed of the newspaper at seven p. m. and desired, above all things, a quiet spot in which I might weep, for I had been working 18 hours a day for four months and I was nervously exhausted. My good wife fed me well, however, and appeared to consider our plight in the light of something less than nothing. So I set my typewriter on the dining-room table after dinner and hopped to it. That night I wrote an 8,000-word newspaper story entitled, 'The Failures,' and it looked good to me. After breakfast I walked 40 blocks to the office of *Sunset Magazine* to sell it, and after delivering it I walked 10 blocks more to a friend of mine and borrowed $5.

"I did not sell that manuscript to *Sunset Magazine*. It didn't appeal to them at all, and when they told me so next day, I thought I'd die. I had banked on that story. It appeared that what they wanted was a humorous sea-story. Well, I needed the money, so that night I wrote them a humorous sea-story—and I felt as humorous as a funeral. But the editor laughed at it next day and gave me $200 for it, so we faced the landlord on the morning of December 1. Afterward I wrote that good man 10 more stories, all dealing with those same alleged humorous characters.

"Since that day I haven't tried to do anything except write for a living. I'm happy at it, so why change? Between times, just to prove myself a human being, I have wooed fortune via the oil-well and mining-stock route, endorsed a few promissory notes, and been sued for plagiarism. Once I so far forgot myself as to write a motion-picture scenario, but it was a poor thing and the director rewrote it. Moreover, I have lived that down. At the end of the war I emerged from a year and a half of service as a captain of field artillery, and about the only effect that has had on me is to make me a little careful where I throw my cigar butts and burnt matches."

But one of the most significant facts about this instinctive story-teller's career is that, seemingly, not a single atom of his varied experience has proved to be wastage. All of these experiences have found an important place in the stories which have brought him the fame and fortune that his original business efforts failed to produce.

The secret of his popularity is the downright "averageness" of the people he paints in words, and of their lives, and ambitions, and whimsical inconsistencies. They inherit a good deal of their author's quick Irish wit, but their experiences are the same as their readers either have met or would like to meet.

"Ah, but that fellow Kyne would make a great business man I'll bet!" I recently heard one of Cappy Ricks' admirers exclaim.

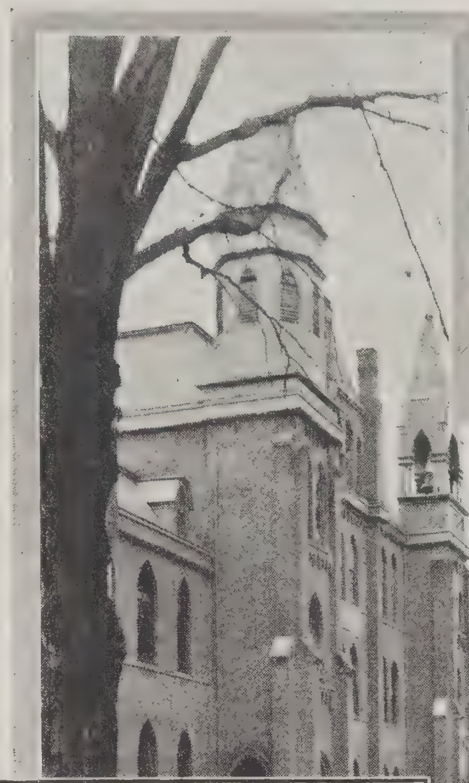
And Peter Kyne's personal estimate is that, when he tried it, he made the worst business man in California. If pressed on the subject, he'd probably admit that he didn't include enough territory.

"Little Hub of the Universe"

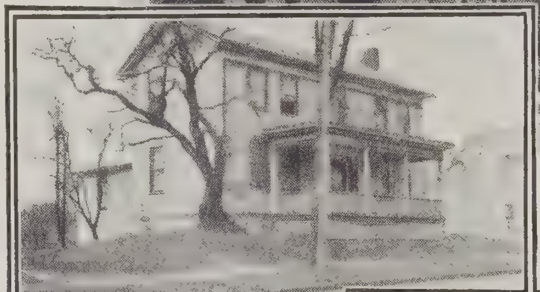
That's What Some Call Westerville, Ohio

By ED. J. RICHARDSON

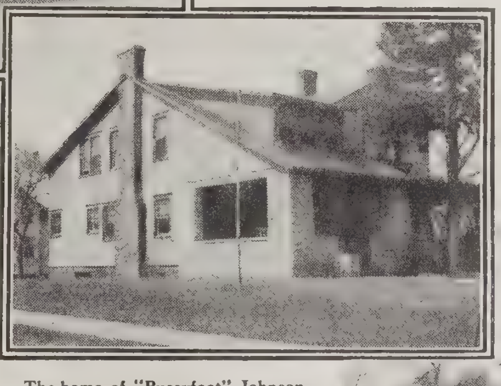
Right—Residence of Ernest H. Cherrington, LL.D., General Secretary of the World League Against Alcoholism and General Manager of the American Issue Publishing Company.



Administration Building Otterbein College.



The residence of Peter Westervelt, one of the founders of Westerville. It is about the only "original" house remaining in the village.



The home of "Pussyfoot" Johnson, the noted prohibition crusader.

The offices of the Anti-Saloon League of America.

WHEN that sturdy family of Westervelts came from New York in 1818 and one of them, Matthew Westervelt, founded the village of Westerville in July, 1839, doubtless no one prophesied that the village would become almost as well known 'round the world as New York or London.

Nevertheless such fame has come to the little Ohio town of a few less than three thousand souls. The chamber of commerce calls it "The biggest little city in Ohio"—partly because it has more miles of paved streets in proportion to population than any other municipality.

A great reform has put Westerville on the world map and it is a shrine for those who rejoice when anything happens further to mar the visage of King Alcohol. But even a great reform cannot eclipse other notable items of interest connected with the history of the community.

To the visitor there is pointed out the old Stoner House which was erected quite a while before the Civil War. It stands very close to the site of the old mill, and is on State street about midway between Plum and Walnut streets. It is a two-story brick building containing about 16 rooms, the main portion fronting 40 feet on State street, while an "L" extends in the rear.

The Stoner House was one of the links in the old chain of taverns between Columbus and Cleveland. Many notables have slept under its roof, yet its chief claim for a place in the public eye is in the fact that it was a part of the famous "Underground Railway" by which Negro slaves escaped from the South into Canada before the Civil War. Many a Negro found safety within its walls, and it used to be said of Westerville, and Oberlin, farther north, "If a slave ever gets into Westerville or Oberlin even the devil can't get him."

Before the sixties, the Stoner House thus figured in efforts to free the black man; in these latter days it has become the property of the Anti-Saloon League of America, and has been used as a part of the equipment of the prohibition forces of the United States for freeing the nation from alcohol. In this connection it is of special interest to note that on the walls of the Stoner House there have been hanging combined pictures of Abraham Lincoln and Robert E. Lee whose names supply the title of the total abstinence department of the Anti-Saloon League, namely, the Lincoln-Lee Legion—for both Lincoln and Lee were total abstainers.

From the earliest days of the town there had been a strong sentiment against both slavery and liquor. So when one day a man came to town, armed with a license to sell "red-eye," it can be well imagined that the community was dumbfounded.

Moral suasion, petitions and entreaties were all applied to the saloon man, but he was unshaken. Then he was insistently given to understand that he and his institution were quite undesirable. Very strong and pointed suggestions to "move on" were offered, and various attempts through court proceedings made the liquor seller more obdurate. At about this juncture an explosion occurred one night immediately beneath the offending barroom, and the next morning citizens viewed with more or less equanimity a hole in the ground and considerable debris on the site. To this day no one has been found to declare that the destruction was not due to spontaneous combustion.

Westerville is pre-eminently a "home town," but it has a number of worth-while industries, including one of the pioneer "novelty" establishments of the country. The village is 12 miles northeast of Columbus and is the center of one of the best auto road systems in the state.

In addition to the old high school building, which will be later used for grades, a junior high school building, costing about $150,000, is under construction. It will be modern in every particular, and is prominently located on the principal street of the village.

Westerville is becoming more and more the center of world prohibition activities. By correspondence and through representatives, the World League Against Alcoholism keeps in close touch with the temperance situation in practically every country.

BRIEFLY TOLD

The first woman Senator is from Georgia. Governor Hardwick named Mrs. W. H. Felton as Senator to succeed the late Thomas E. Watson, until the November elections, when a successor will be chosen at the polls. Simultaneously, in announcing the appointment of Mrs. Felton, Governor Hardwick announced himself a candidate for the unexpired term of the late Mr. Watson. Mrs. Felton is an exponent of woman suffrage and an active member of the Daughters of the American Revolution.

It is reported that the Stinnes group of Germany has received a concession to repair the wharves and houses of Petrograd—a task requiring several years' work. A shipbuilding firm of Germany is rebuilding the Volga merchant-fleet for Russia.

A large deposit of a volcanic ash, suitable to manufacture cleaning compounds, has been found in British Columbia. Experiments prove that it can be used to polish gold and silver plate.

A high-grade oil is to be manufactured from dogfish which swarm in Pacific waters. A newly formed company in the Queen Charlotte Islands, off the mainland of British Columbia, will catch the fish in traps and extract the oil by a new and patented process. The traps will not interfere with the salmon and other food fish.

A Chinese junk, the *Amoy*, recently crossed the Pacific Ocean from Shanghai to Victoria, British Columbia. As far as is known this is the first time in history that a junk ever crossed the Pacific. The *Amoy* has three masts, without auxiliary power, is 69 feet over all and 48 feet on the water line. The *Amoy's* master is a Dutch-Canadian who married a Chinese woman. His wife operated the ship during the 91 days it took to make Victoria.

Short skirts, short sleeves, low necks and high heels in feminine apparel have caused several Swiss insurance companies, which insure against illness, to raise their premiums 15 per cent for women.

Carriages fitted out in silk, velvet and leather, with ivory and nickled fittings, costing at one time $15,000, were auctioned off in Knoxville, Tennessee, recently, for $20. The carriages once belonged to Tim Sullivan, Anthony J. Drexel and other distinguished citizens. Several horses sold for from $5 to $51 each.

The finger printing of every person in the United States is recommended by the New York State Chamber of Commerce as a protective measure to make difficult "the evasion of clever and dangerous aliens sent here for the purpose of spreading discontent among the unassimilated portions of our population."

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

No point in Scotland is more than 40 miles from sea water.

The president of Dartmouth College has asserted that too many men go to college. He deems it necessary "to define the individuals to whom in justice to the public good the privilege shall be extended, and to specify those from whom the privilege should be withheld." He believes there is "such a thing as an aristocracy of brains made up of men intellectually alert and intellectually eager, to whom, increasingly, the opportunities of higher education ought to be restricted."

During the administration of Evangeline Booth as head of the Salvation Army in the United States, nearly 20 years, the students in the Army's training school have increased from approximately 70 a year to 500, while the assets of the organization have risen from $1,500,000 to $23,000,000.

A spoken newspaper is the latest innovation in France. The *Parole Libre,* formerly the *Libre Parole,* has given up its type and presses and will present its news orally instead of typographically. Subscribers are welcome to semi-weekly lectures where current events are read off by the editors. Experts and men in the public eye discuss questions of moment. This discussion is considered a substitute for the editorial page. The staff is paid on a time basis.

A college for domestic service and the useful arts has been established in England. A graduate will know all about cooking, needlework, laundry work and general housework. Attention is also given to singing and piano playing. A sum of $250,000 has been set aside for the establishment.

Japan says it will restore the leasehold of Kiaochow to China December 2. On that date the Chinese flag is scheduled to be raised over the district for the first time since Germany acquired the territory in 1898. At that time Germany was given a 99-year lease of Kiaochow and the territory surrounding it when two of her missionaries were killed in Shantung. The lease ceased to operate when the war broke out and Japan occupied the property. The territory comprises 250 square miles and possesses an excellent harbor.

The Rockland Lake lighthouse on the Hudson River began to lean shortly after it was built. It was caused probably by the washing out of an old oyster bed. The lighting machinery has been adjusted so that it functions properly.

The French Ministry of Foreign Affairs has refused to allow the manuscript of Goethe's "Faust" to be sold at public auction. The manuscript will be returned to Germany. This manuscript was on exhibition at the Lyons Exposition when the war broke out, having been loaned by the German Museum at Frankfurt. Later it was sequestered by the French Government as enemy property.

The $15,000 bond of William D. Haywood, convicted I. W. W. leader, has been ordered forfeited and deputies ordered to collect the bonds. Haywood fled to Russia and has never returned.

The delay of the French and Italian governments to ratify the documents of the Washington Arms Conference treaties has been a matter of discussion in Japan, and informally her representatives have talked with American officials regarding the desirability of rewriting the treaty and the so-called Four-Power Pacific Pact so as to make them applicable to the three countries which have ratified, leaving Italy and France out of the naval treaty and dropping France from the Four-Power Treaty.

The old battleship *Kearsarge* has been cut down and made into a crane ship, the only one in the world. The massive crane has a lifting capacity of 250 tons and is capable of tugging from its moorings an object weighing 500,000 pounds.

Coal prescriptions, signed by physicians, are deluging Chicago coal dealers. These prescriptions urge that certain consumers, because of illness or other emergencies, be preferred in coal distribution. In the belief that each instance must be one that demands special consideration the dealers are complying with the demand and furnishing the coal on prescription.

Large deposits of coal have been discovered on Lake Tanganyika in Belgian Congo.

"BEER AND WINE" NEVER AMERICAN

Old-time Feud of Distillers and Brewers Recalled by Those Watching Efforts of the Group Seeking to End Prohibition

Misery of Real Poverty Stalking Educators Brings Wives' Protest

CHRONICLER OF THE NEGLECTED TRUTH

"Beer and Wine" Are Not American Tipples

Political Ignorance of Persons Advocating Dry Modification Amazes Those Who Recall Feud of Brewers and Distillers

By LEWIS HARPER

THE political ignorance of the neo wets now being ranged under the "beer and wine" banner is at once profound and amusing. They evidently do not understand that in adopting the slogan of "beer and light wine" they are reviving a feud which was largely responsible for the early advent of prohibition, and at the same time are running counter to a profound prejudice—almost an instinct—of the American breed—the folk of the small towns and the country who after all still rule this nation.

It will probably be news to the "moists" that it was the internal strife in the liquor trade between the distillers and the brewers that brought about the enactment of prohibition in state after state. This bitter feud—based on irreconcilable differences in economic interest and racial temperament—caused the enactment of "war time" prohibition which was the prelude of the Eighteenth Amendment. By their championship of "beer and wine" they are renewing this old chasm. By their avowed preference for "beer and wine" and vociferous repudiation of whisky and distilled liquors they are not only alienating a very large segment of wet strength but are emphasizing *the ALIEN character of the wet movement.*

The merest political tyro, it would seem, ought to know that even 10 years ago the fight for prohibition was taking form as a battle between the American and alien elements of our population. There were many reasons for this—some historical, some biological. It is pretty well understood today that the Nordic races are subjected to a more rigid selective process by the use of alcohol than are the less highly developed races whose low nervous organization gives them apparently a relative immunity to the vice. The enactment of the prohibition amendment was the greatest political victory scored by conscious American nativism in half a century. American dry sentiment was always just as hostile to "beer and wine" as to whisky. Probably more so, for whether it be more or less pernicious than the undistilled forms of alcoholic liquors, whisky was the native drink and the saloon was an American institution.

Wine and Beer Not American

WINE is not now and never was an American drink. Beer was an alien importation and a recent one at that. The brewing industry was only an insignificant exotic up to 1876. Following the development and commercial adaptation of artificial refrigeration about that time it began to grow, taking enormous strides year by year. For a long time, however, it was confined to the alien population and despite its rapid conquests in the nineties it never attained a firm foothold outside the towns. There was always something foreign, something suggestive of a cultivated taste, about beer to the American, especially the country boy who came to the city to live. Whisky was the native tipple and there long survived among drinkers the feeling that it after all was the real he-man's drink. Bourbon in most of the South, rye in Maryland and the North, were felt to be the natural heritage of the sons of the soil. It is interesting to note that the immigrants from the British Isles also took to the native whisky and, except on the Atlantic seaboard, did not generally introduce their ale, stout and porter.

Even the second-generation German was fast becoming a hard liquor consumer as any one who ever sat around a "Dutch" saloon until late in the evening could readily see. Starting out on beer it was becoming the regular thing for the second-crop Teutons to wind up on high balls, until Mr. Volstead put out the lights forever.

Although the champion whisky drinker of the United States is supposed to have been a gentleman who lived at Guthrie, Kentucky—his name was long celebrated in barroom lore—the best hooch hoister I ever saw hailed from St. Louis and bore a name that would not have been out of place on the Wilhelmstrasse. Incidentally, the Kentuckian eventually died of acute alcoholism but the St. Louisian survived, reformed, and is today the father of an interesting family.

Before the Beer Age

IT IS not merely a coincidence that the rise of the saloon as a social institution and its alliance with the city politics, which rested on the slum power, was closely connected with the growth of the brewing industry. Before the Beer Age, which was also before the steerage, the dramshop, while distinctively American in tone, was insignificant, politically and economically. Whisky was mostly sold in groceries like molasses or kerosene and consumed at home. With beer came the expansion of the social saloon, also its transformation from a simple dramshop to an institution linked with many side lines—usually in the way of illegal privilege. Also came the variants of the saloon—all un-American—the rathskeller, the beer garden, the dance hall, the "family entrance" and finally the close interlocking of liquor vending and commercialized vice.

It was not long before the brewers, who were making more money than they knew what to do with, were reaching out and syndicating the saloon business. It is not worth while to recount this evolution—or rather degeneration. Every American over 35 years old who ever lived in a city knows or should know all about it. Suffice it to say that the chain saloon antedated the chain store or the chain newspaper. The saloons became fiefs of the brewer. The big brewing barons soon occupied a relation to the city and state governments similar to that of the feudal barons of medieval Europe to the puppet kings of that age. They early began to install foreigners in the saloons and were hard at it up to the day that the saloon was outlawed. They displaced saloon keepers of their own race for the more pliable breeds from the Mediterranean littoral. The Irish were the first to go, the Germans followed fast and by the time prohibition came, it was only a few expensive rathskellers and some neighborhood places in pinochle neighborhoods that remained in German hands.

Whisky had become a side line to beer—then the Jews gained control of it, first of the wholesale liquor business and then of the distilleries. Whether they would have pushed their conquests into the brewing field and thence into control of the chain saloons must remain a moot speculation as their first essays into brewery finance came too late in the day to affect the line-up at the booze Armageddon.

War Brings Taps for Booze

BUT their control of whisky was fast becoming absolute in the closing days of the trade. Here and there an American, Scotchman or Irishman held out as a high-grade liquor merchant or importer, and in Maryland and Kentucky a few of the older stock continued to distill whisky—that is, pot-still whisky. But the alien manufacturer and his compatriot rectifiers were driving "straight" whisky off the market. The makers and vendors of "blends," using the neutral spirit manufactured in the murderously scientific fractional still, had taken more than 85 per cent of the spirit trade by 1909 and American drinkers were tippling a counterfeit—chemically equivalent, but with the natural "velvet," "boquet" and physiological adaptability of the straight product gone.

Then came the war—the bugles which sounded assembly for the national armies were sounding taps for booze.

The Anti-Saloon League, the most realistic and effective political machine that ever functioned in America, was quick to seize upon the value of the war in crystallizing American nationalism against the liquor element. The latter did nothing to meet the new attack and continued to send lobbyists with German names to appear before Congressional committees, and to encourage leaders of the Brewery Workers' Union from Milwaukee to make threats of strikes and labor shirking, if beer were interfered with. The old breed of clergymen, from whom the league recruited most of its leaders, were shrewd men educated in an iron man-making school, far different from the seminaries that are turning out so many flabby parsons today.

Mr. Arthur Brisbane, America's most highly paid journalistic pretender, was the author of the crowning *faux pas* which gave the Anti-Saloon League such deadly ammunition in the early days of the war. It was in connection with the discovery that a brewing syndicate, headed by Christian Feigenspan, of Newark, New Jersey, had bought the Washington *Times* for Brisbane, paying out $800,000 for it, that the Anti-Saloon League received and adopted the suggestion that it would be a good plan to link up beer and anti-patriotism.

Brisbane Helped Prohibition

BRISBANE, of course, unthoughtfully, gave an excellent background for this Anti-Saloon League propaganda by using the *Times*, which the brewers had bought for him, to propagate subtle anti-ally sentiments throughout the summer of 1917. Although Mr. Brisbane evidently did not appreciate the fact or did not hear of it, this was the very period in which the tide of war sentiment among the American people was rising fast.

By the next spring even Mr. Brisbane understood that the American people were roused to the fighting pitch and changed the tune of the *Times*, but the damage had been done—right under the eyes of Congress at that. The brewers' investment of $800,000 in Brisbane's beer and wine *Times* at the capital in 1917 was thus in effect an investment of $800,000 of beer money in first-class dry propaganda. For this they can thank Brisbane's egregious underestimate of the spirit of the American people. However, this is not the first time he has failed to gauge what Americans think. There are so few Americans in his circle that the mistake is every now and then inevitable.

While thus engaged in giving the wet cause a knockout blow, Mr. Brisbane had also been denouncing whisky and crying for a national policy of light wines and beer, with the elimination of distilled liquor. In connection with this phase, Mr. Brisbane belabored the Demon Rum right manfully and used his imitative vocabulary and endless volubility in painting pictures that made Ten Nights in a Bar Room pale by contrast.

However, this was an old brewer policy—whenever they believed they could get away with it—and this brings us to the heart of our story. Brisbane and the brewers' course were watched with supreme disgust and resentment by the whisky lobbyists then stationed at Washington. The natural ill-feeling between the distillers and the brewers, the contempt of the whisky men for what they had long felt was the treacherous and "yellow" tactics of the beer magnates, was heightened by what they saw was the very climax of stupidity. They saw their own cause imperiled by this dangerous trifling with the patriotic sentiment of the people, and indeed there was a patriotic resentment on the part of many distillers—Americans who survived in the business and whose Americanism survived the business.

It is one of the curious facts of American history, one unexplainable on the theory of economic determinism, that most of the heavy fighting against prohibition was done by the whisky distillers and dealers—NOT by the brewers. This, despite the fact that the brewers had the greater investment, and were in control of the saloons through which the whisky men had to dispose of their product. Through their control of the saloons the brewers were also in more immediate contact with the voting masses and nearer to the impact of public opinion on the trade. But nevertheless it was the whisky men who maintained the more alert and aggressive political and publicity organizations. For years before the final prohibition crash, the brewers were heartily cursed at every gathering of whisky men, first for creating the conditions in the saloons which were turning the people against the whole liquor industry, second for "laying down" and "quitting cold" whenever the conditions they had created resulted in a political battle to eliminate the trade.

Double-Cross Brothers-in-Arms

IN SEVERAL states, Tennessee for instance, the brewers practically double-crossed the wet cause and left the whisky men to do practically all the fighting. Even when the two forces were apparently fighting side by side, the whisky men always had the uneasy feeling that their allies were always ready to quit or betray them to the enemy. More than a quarter of a century ago, the whisky people became aware that the brewers cherished the hope that they would some day be able to drop their whisky associates and to secure legislation eliminating distilled liquors. Two purposes were back of this. The brewers desired to acquire a monopoly of the alcohol trade. They believed that the danger of ultimate prohibition would be avoided forever if the nation could be put on a beer and wine basis. They believed that whisky, not beer, was the cause of prohibition sentiment and figured that if they were rid of whisky, there would be an end of dry sentiment.

Undoubtedly, the propaganda of the brewers for their product, which was so often connected with propaganda against whisky, contributed greatly to the sentiment against all alcoholic liquors. It is interesting to recall that the brewers never did in fact secure in any American state a law limiting the alcoholic content of potable liquors—all their propaganda for such beer laws went for less than nothing so far as their own purposes were concerned. What they did was to create prohibition sentiment and earn the distrust and hatred of the hard-liquor men—their unwilling allies in many a hard-fought battle.

As the drys advanced their lines, the brewers instead of perfecting their alliance with the whisky men, were more and more disposed to strike out for themselves and to attempt to get beer laws passed. After the revival of the prohibition campaign in 1907 when Georgia went dry and started a chain of state dry victories, Mr. Hearst began an intensive campaign in his newspapers against whisky—with the intent of aiding the brewers to put over a wine and beer program. Like his man Brisbane, Hearst saw his efforts produce results which were the reverse of his intention. The American people NEVER DID and probably never will "fall" for the beer and light wine fallacy. *Science as usual is confirming popular instincts, and is about ready to indorse the old American prejudice against beer.*

Distillers Came Out All Right

THE Congressional roll calls will show that at the critical points in the fight for "war time" prohibition—which made the Eighteenth Amendment inevitable—the votes of the representatives from the distilling districts of Maryland and Kentucky were cast so as to put the brewers out of business in the name of grain conservation. Whisky went too. But, Oh, what a joyous departure! It was a gorgeous, gilded leave-taking for the distillers. Cached in the bonded warehouses they had something like 250,000,000 gallons of ripening booze and the law gave them time in which to sell at least two-thirds of it—AT THEIR OWN PANIC FAMINE PRICE.

But the poor brewers. Alas! they had only about six months' supply on hand when the law cut off their supply of grain.

Needless to say the feud is not dead, as the neo wets now crying for "beer and wine" will find out in due time.

How popular that "beer and wine" thing will find itself in the distilling sections—in Peoria, for instance, or Nelson County, Kentucky!

Politically, "beer and wine" is not even a good joke—there is nothing very entertaining in a gab fest of amateur statesmen over a dead issue.

Wall Street Control of Cotton Prices Costs Southern Planters Millions Yearly

Speculators, Who Never See Staple, and Never Buy It, "Deal" in Futures

By WM. BUTLER

FEW understand the technical operations of cotton exchanges, and the inside machinery conducive to the manipulation of prices. To this lack of knowledge may be partly attributed the deficient legislation that has from time to time been enacted against cotton exchanges.

Exchanges in general, and the New York Stock and Cotton Exchanges in particular, are like giant spiders spinning an interminable web over the commercial economy of the nation, catching the unsuspecting adventurer in business. The spinning has been carried on so long, and has so many ramifications of political strength, that the threads of the web have become like cables of steel, which can be cut and destroyed only by the steel-saw of public opinion sharpened to the actual truth of the case.

The mystery of cotton exchanges—their history, function, use and abuse, and how these giant gambling palaces keep within the law and thrive, constitute a story well worth the relating.

At the feast of the New York Cotton Exchange in 1920, in celebration of the fiftieth anniversary of its organization, a pioneer member told how cotton exchanges came into existence. He said that back in the fifties and sixties, cotton merchants traded in a more primitive way, more from hand to mouth, and had not developed the great modern system of buying and selling for future delivery, of contracting for heavy deliveries far ahead, which system, as we know, gives a tremendous expansion to business, and, furthermore, instills into it a high sense of honor and trust, and develops business acumen. Their trading was on a narrow scale because they lacked the protective facilities for large-scale trading, such as highly organized insurance companies to assume the risks on their stocks.

As the demands of trade grew, however, one New York merchant took the initiative by offering to deliver cotton to a foreign buyer, at a fixed price on a future date several months ahead. That transaction was the forerunner of the establishment of the New York Cotton Exchange. A few years later, in 1870, the Exchange was established. Thus, the cotton world was given a liquid trading center for dealing in cotton for future delivery.

There are two official cotton exchanges, the New York Cotton Exchange, which is the leader, and the New Orleans Cotton Exchange. These are known as cotton-future exchanges, since they are markets for trading in "futures," that is, cotton for future delivery.

There are four great cotton-future exchanges in the world, the two in America, one in Liverpool and one at Alexandria, Egypt. Cotton-future exchanges have also been established at Havre, France, Sao Paulo, Brazil, Yokohama, Japan, and at New Bedford, Massachusetts, the latter for trading in cotton of long staple variety, such as the fancy varieties grown in the far West and off the coast of the Carolinas. These exchanges are of minor significance as speculative markets when compared to the four first named.

Cotton Futures and Market

A SEAT on the New York or New Orleans Cotton Exchange sells as high as $18,000. The New Orleans Cotton Exchange occupies a magnificent new structure, a show-place of that city. The New York Cotton Exchange is constructing a two-million-dollar building for its future home. Thus, the official exchanges are preparing for an expansion of speculative trading, and are apparently confident of the future.

There is a distinction between a cotton-future exchange and a regular cotton market where the world buys supplies of cotton. Cotton markets are located principally in the southern states, near the heart of cotton-growing sections, in cities such as Galveston and Houston, Savannah, Montgomery, Memphis, and so on, and are called "spot markets." Great quantities of cotton are shipped to these markets, where it is sold to street buyers and merchants, or stored in warehouses to be sold to factors and mills. The lifeblood of the cotton-growing world flows through these big spot markets, where transactions for actual cotton take place.

On the future exchange, however, cotton is never seen. A visitor to one of the exchanges has the impression at first, that he is entering bedlam, or perhaps a wild animal show. A dense crowd of 50 or 60 men are hovered over a sunken pit, waving arms and yelling in hoarse voices, loud enough to awaken the Seven Sleepers. Their yelling is wholly unintelligible to the visitor. The uproar continues from 10 a. m. to 3 p. m. They are the brokers of the Exchange *and are trading in cotton on paper,* that is to say, are auctioning off contracts, which represent one hundred bales of cotton each, 500 pounds to a bale, *the cotton supposedly to be delivered at some future date. But owing to the elasticity of the contract, only a very small portion of it is ever delivered.*

When a contract is sold over the official trading pit, the price per pound and month of delivery named in the contract are immediately marked on the blackboard of the Exchange, and this quotation is then flashed by wire to all parts of the cotton world, as the latest official price paid for cotton for future delivery. Contracts thus bought and sold are called "futures."

"Futures" excite in man the passion to gamble on the outcome of the future. The majority of traders, and in fact brokers themselves, see so little of raw cotton that they lose appreciation of its merits, and do not seem to know or care whether they are trading in cotton or chalk-marks. *Their consuming purpose is to grab profits on contracts as quickly as possible.*

The future exchange, as we see, is the gambling side of the cotton business, and, therefore, the rotten side. It is more of a sham than an essential cotton market, a clearing house for gambling in fictitious cotton. It has certain beneficial features which will be shown later.

As an illustration of how some business men regard the vocation of broker and speculator, a story comes to my mind about a cotton broker who went to considerable effort to compile and print an elaborate booklet on cotton speculation and prices, endeavoring to show his clients what he knew on the subject. He mailed several thousand copies to them, and then waited to receive their complimentary remarks. The first reply was from a business man in Texas, who returned the booklet with the following words written across the title-page: "Why don't you go to work?" Although the broker would laugh when telling this story, he confessed that the words aroused in him deep chagrin.

Markets, like individuals, cannot move in an orderly way without a recognized leader, some leading market to guide the smaller markets in quoting prices. The New York Cotton Exchange, although from 1,000 to 3,000 miles from the eastern and western sections of the cotton belt, *and handling less than five per cent of the whole crop,* holds the distinction of being the all-powerful leader of cotton prices. *Its sway over the southern spot markets is so far-reaching and inexorable, that cotton merchants in those markets cannot afford to buck this influence and keep solvent. Consequently, when prices at New York decline, prices in the southern spot markets invariably decline.*

Accept New York Prices

WHY this power? Because the commercial world accepts the New York Cotton Exchange as the head of operations, the official trading center of the cotton world, the index of supply and demand. And the powers behind the Exchange have the money and organization to hold this recognition, in spite of the fact that it is an ignorant delusion.

The Liverpool Cotton Association was the mighty leader of prices until the outbreak of the World War. This leadership resulted from the fact that three-fourths of the cotton raised in America was exported to Europe, chiefly to England, and also because London was the money and trade-acceptance market of the world. Liverpool was more or less the dictator of prices. If prices at Liverpool declined, but American markets failed to follow, London financiers, who were the source of most of the loans on cotton stocks, would often get busy by calling the loans, *forcing up rates on money,* and in this way compelling American holders to dump cotton and break the American market. The financial powers of England employed every means to wrest cotton from American growers as cheaply as human ingenuity could get it. Southern planters received 20 cents a pound, as an average, for their products for 30 years after the organization of this association. Thus, kept in poverty, they were forced to sell the greater portion of their crop in the autumn, at or below the cost of production. Naturally, they were slaves of perennial debt.

The war changed this monopoly and shifted the balance of power from London to New York, the present money market of the world. American consumption of cotton has increased 50 per cent in five years. American mills now consume as much of the southern crop as foreign mills combined.

If English interests attempt a conspiracy to force down prices, they can no longer effectively employ the machinery of Liverpool and the aid of London bankers to do the trick, but must secure the support of New York interests and manipulate the New York Cotton Exchange by wholesale short selling, a nefarious method of trading with evils that are not fully understood.

The fluctuation of prices offers a strong temptation for easy money. Fluctuation invites speculation, which in turn creates greater fluctuation. Both the fluctuation of prices and speculation have increased in recent years, aided by the elaborate wire and cable systems which make the world a homogeneous unit. As an illustration of how quickly inhabitants of remote regions can trade on New York and Chicago Exchanges, the following occurrence is given from my personal experience: I purchased corn "futures" on the Chicago Board of Trade, through a broker of Birmingham, Alabama. I then went for an outing in the southern part of the state, about 100 miles from Birmingham. On Saturday, a few minutes before the close of trading on the Chicago Board of Trade, I called over long-distance telephone and asked the Birmingham broker about the market. He informed me that a jump had occurred in corn prices. Thereupon, I directed him to rush an order to Chicago to sell my purchase before the close of trading, if possible. The time was then one minute before the close. He had a direct private wire to New York, but none to Chicago. So, he had to send the order via New York. It reached the floor of the Chicago Board of Trade and was executed before the close of trading, while I, 1,500 miles from Chicago, was holding the telephone receiver.

A trader may either buy or sell, play the market either way, whether or not he owns a bale of cotton. This form of speculative selling is certainly abusive to the interests of the cotton grower. The trader may "short sell" any amount of cotton he so desires, provided he has sufficient funds to margin the sale. For instance, Mr. A requests a broker to sell 1,000 bales for December delivery at 20½ cents a pound. The broker makes the sale on the Exchange, and then gives Mr. A a statement, reading: "We have this day sold for your account 1,000 bales, December delivery, 20½c." On the back of the statement, the following condition is printed: "All orders for the purchase or sale of any article are received and executed with the distinct understanding that ACTUAL DELIVERY is contemplated . . . ." Thus, the transaction is given the flavor of a legitimate trade and is made within the law.

Although Mr. A has made a tentative pledge to deliver 1,000 bales in December, he has no intention whatsoever of doing so, as he probably never owned a bale in his life. Any moment during trading hours, before the month of December arrives, he can close his trade, take his profit or loss, and be relieved of the obligation to deliver in December, simply by buying back as many bales as he sold.

Short selling, although conducted on paper, has as much weight in depressing prices as though actual cotton were being sold. Mr. A exercises as much weight upon the price level when he "short sells" 1,000 bales as a farmer does when he sells 1,000 bales that he has produced by the sweat of his brow, on 5,000 acres at a cost of some $75,000. Mr. A is allowed to "short sell" 1,000 bales on a capital of $7,500, which is the usual margin required by brokers, and which is exactly one-tenth of the amount the planter has to pay to produce and sell 1,000 bales. No wonder the planter is discouraged, when the whole world can sell cotton, speculatively, at one-tenth the cost of production.

That is the serious reason why short selling distorts the basis of supply and demand. The cotton world looks to future exchanges to register prices that truly reflect supply and demand, but when nine-tenths of the turnover on these exchanges are paper sales, fictitious cotton, supply and demand become a mockery, since a spurious price prevails that falsifies true values.

If a crop of 10,000,000 bales is raised, how may planters receive a legitimate price for it, when speculators are allowed to "short sell" 25,000,000 bales, and paralyze the price and demand?

Selling of this nature spreads discontent throughout the economic world. Farmers become depressed, refuse to raise bumper crops, and emergency organizations spring up and spread propaganda urging farmers to hold down acreage and automatically force up prices. The evils of short selling should not be tolerated by the Federal government. In fact, in 1918, the United States Department of Agriculture temporarily stopped short selling, after English spinners and speculators had "short sold" 1,000,000 bales on the New York Cotton Exchange, and had broken the price 10 cents a pound, or a loss of a half-billion dollars to the South.

Handle Little Cotton

SHORT selling represents the "short side" of the market, which is usually the side on which professional traders operate, as quicker profits can be made on this side. Prices fall faster than they rise. Therefore, it is the shortest way to profit. The other side of the market is called the "long" or buying side.

Short selling should be permitted only as a protective measure, to enable growers to hedge and insure the price of their crops. It then makes the cotton-future exchange what it should be—an insurance market and not a gambling hell. But as a weapon in the hands of the speculator, it too frequently means a stab in the back to the cotton grower.

If speculation could be eliminated from exchanges, the great spot markets of the South would then become the rightful leaders in quoting prices.

Attempts have been made to regulate gambling on exchanges. Statutes such as "An Act to tax the privilege of dealing on exchanges," and later in 1916, "The United States cotton futures Act," were passed at Washington.

Legislators who drew these acts realized that speculation was so impregnably intrenched in future exchanges that the time was not opportune to try to dislodge it altogether. Their object was to narrow the scope of future exchanges, and in turn reduce gambling and minimize the harm in short selling.

The United States cotton futures act forbids some of the lower grades from passing through the exchanges, such as cotton below the grade of Good Ordinary, or less than seven-eighths of an inch in length of staple. Speculators are thus prevented from buying up cheap, unspinnable cotton and dumping it on exchanges to break prices. The act undoubtedly has beneficial features, such as requiring the Secretary of the United States Department of Agriculture to set up official cotton standards, and giving to him some authority over future exchanges. The act does not reduce the volume of speculation, which is the crux of the whole situation.

Only a small amount of actual cotton is handled by future exchanges. The exchanges never did and probably never will function as markets for the sale of real

(Concluded on page 13)

"It's a Long Lane—"

JUDGE HAND, of the Federal Court in New York, has ruled that American steamships cannot carry or sell liquor in any part of the world. He further said that "it would be a curious thing if a country professing under its fundamental law to forbid use of intoxicants was to allow them without stint upon ships that sailed under its flag."

Judge Hand refrained from touching upon the curious action of a high Federal official who, through some strange personal interpretation of what the Constitution of the United States means, first permitted, and then indorsed the selling of liquor on American government-owned vessels operating directly under his orders.

There is something most peculiar, almost touching on the sinister, in the manner in which the enforcement of prohibition is being *bungled* under the present Administration. This publication has viewed with considerable wonderment some of the activities of the official Washington mind in dealing with infractions of the law, and a checking-up in certain quarters has revealed a most alarming and unsatisfactory state of affairs. It is to be hoped that the publicity which will be afforded some of the things now going on in Washington will have a curative effect. It is most discouraging to record, however, that the Administration seemingly at no time has evinced a desire to get in step with the people, a step of far different cadence than that of the crowd with which it has been in line.

The recent seizures of British ships outside the three-mile limit because of the fact that they carried cargoes of liquor are indicative of the trouble-making propensities of those who are interested in "putting across" certain designs. The seizures resulted, of course, eventually in the freeing of the ships and the restoration of the cargoes. Had not some one at some time displayed some good sense, the incidents might well have been magnified into a serious unpleasantness with the British Government. And that would have been pleasing to certain elements that are ever active.

We have official bootleggers in the Administration who were willing to compromise the basic law of the country solely because of ulterior motives and designs. Their intent was to lay a foundation upon which renewed efforts to obtain the passage of ship subsidy legislation could be attempted. This foundation has been laid. The cry already has gone out, "Without liquor it is impossible to operate American ships in competition with foreign-owned passenger-carrying vessels." Therefore, a subsidy, to permit the "successful" operation of these ships.

Honesty has suffered such a tremendous eclipse in Washington that the good work of fleecing the all but helpless people probably will continue.

Such practices cannot go on forever. You will answer, "they always have," and there will be considerable truth in the retort, but one also recalls that at times that changes *actually were imperative,* those changes came about.

A change is coming.

An Alleged Shortage

CERTAIN sections of Big Business are beginning a campaign for the abandonment of immigration restrictions, alleging a threatened shortage of common labor. The inconsistency of this with high tariff legislation to keep out the product of European labor is so apparent that a mere allusion should be sufficient. It is the paradox of economics that Big Business claims to champion the American wage-earner by excluding the product of foreign factories, while bringing into direct competition here the foreign labor itself. It is equally paradoxical to expect to maintain an American wage level, with the foreign market closed or partially closed in retaliation.

But the plan is neither paradoxical nor inconsistent, when the motive is realized. Big Business seeks cheap labor, not only to gain larger profits, but to hold the threat of unemployment over American workmen. Nothing so subdues a worker as an army of job-hunters hungry for his place. So, the emergency Congress is to be called upon to open wide the gates, not to actual immigrants desirous to make homes and become citizens, but to hordes of every class who cross the ocean only to gather together what seems to them a fortune, with which some day to return to the homeland and a life of ease they could never wrest from home employment.

They will endure privations here for a time to amass the means of enjoying the future. Many will be disappointed, for the lure is a false one; many will become, if not already, recruits to the ranks of the lawless; many will return despondent; while our own labor will be degraded. But if Big Business wins, the transatlantic liners will be crowded, and unscrupulous immigration agents will reap a large harvest.

The process is simple, but sure, as experience of the past teaches.

What One Reader Did for His Town

SAYS a DEARBORN INDEPENDENT reader: "My copy of the paper has been worth $50,000 to our town." How is that? How can one dollar and a half become worth $50,000 to a town?

In this instance the town of B—— was about to bond itself unreasonably and thoughtlessly; it was proceeding in the same mood which blinds all towns on similar business—when a reader of THE DEARBORN INDEPENDENT, who had been following the series of articles on municipal debt and the insupportable load of interest charges, began to show his copies around, and the people began to ask questions.

The first thing they found was that only three men in town knew anything about the matter—a couple of councilmen who had been in office for years, and the town banker.

Nobody even knew what the system of bonding was. No one knew that the town of B—— was binding itself to pay $60,000 in interest for the use of the $50,000—a total of $110,000 in all. No one knew that the utility to be installed was already passing out of use and that it represented a deal between moneyed interests to unload one more on a "hick town" and insure an income for 30 years out of the labor and taxes of the people of B——. No one knew that because no one had told it. The town was about to do what the wiseacres said that all towns did in similar circumstances. But THE DEARBORN INDEPENDENT reader, having the facts of other towns' experience, was able to start the community mind working.

The principal cause of our political mistakes is our failure to ask questions and our lack of power to compel answers. We assume that official action is always wise. We assume that frequent precedent is a sufficient safeguard. We assume that civic responsibility can be satisfied by the phrase, "It's what they all do." What is needed is a citizenship that will ask questions and not be bluffed into a confused state of mind by the contempt with which questions will at first be received. If every township had a Socrates, a questioner, more light in government would come.

To Buy Another Whistle

NOW the government has practically completed the restoration of the silver dollars sold England during the World War, the silver mining industry is alert to discover some means for keeping up the market price of the product of domestic mines.

It will be remembered that silver bullion on the metals market is worth about 60 cents an ounce. A trifle more, perhaps, at times, but it would be less save for legislation. For, in directing the purchase and coining of the silver taken from the Treasury vaults, the law was made to specify that American silver only be so purchased and coined, and that the price paid should be a dollar an ounce. This means a subsidy of 40 cents an ounce to the producers.

It is now proposed that some 80,000,000 more ounces be purchased and coined, and loaned to China as a means of gaining her trade and establishing relations with that great empire which would give this country an advantage.

Eighty million ounces of silver will coin into about $96,000,000. Thus the loan should be nearly a round $100,000,000, for the silver dollars would be receivable at face in this country; yet the proposition includes the surrender of the money at cost, or a dollar an ounce.

Two points may be considered in the plan, the first being quickly disposed of by the statement that the primary inspiration for the suggestion is the profit of $40,000,000 the silver producers would net from the sale.

The second is more complicated. China would receive about 100,000,000 perfectly good American silver dollars, which, worth a hundred cents each in this country, would buy but 60 cents each worth of goods in any other country. This would net her 20 cents on each dollar in repaying the loan. As she can buy silver at 60 cents an ounce and coin it herself, it is a question if the profit would induce her to borrow here unless she were unable to buy the metal in the competitive market.

But the United States, in any event, will pay a fat price for an extremely small whistle, if the project is put through, for she will have added a hundred billion of fiat silver to the amount she now holds. This, to the belief of many reformers, would not be a loss in itself, but it would be fatal to the theory held by all advocates of the present money system except such as are beneficiaries of the silver subsidy.

Taxation of Church Property

THE chief study of those responsible for fixing the tax burden in these days is to discover new sources of revenue, rather than to the more simple plan of devising means to reduce the burden. At present there is a fair prospect for the renewal of the demand that church property be placed on the assessment roll, under the idea that in some way communities suffer from its exemption.

Not only is this a false notion, but if it prevailed it would make no difference with the weight of the burden, except to add to the inequity. As well might schoolhouses, township, village and city jails, lock-ups and other municipal buildings, courthouses, jails and almshouses, together with state property of all kinds, be placed on the rolls. Neither public property nor church property would pay the taxes thus laid, but the people would, just as they do now.

There would be greater inequity than now exists, in several ways, among them the burden of specific taxation, already unfair, would be lightened in states where it depends on the ratio of taxation. Addition to the amount of assessable property lowers the rate of the tax without reducing its amount. This reduces the actual specific tax in proportion.

A second injustice would be to such organizations as maintain separate schools and charitable institutions. These already pay their proportion of the general tax and assume a self-assessed burden to maintain their own schools and hospitals. Add to this double burden the volume their investment in property would cost if placed on the rolls, and their enterprise, which now acts to relieve the whole from increased facilities, would be too great to be borne.

There is no source of added revenue save in added taxes. The quest should be for means to reduce expense. Cut out every nonessential. Refuse to add to the burden of interest on public bonds. Pay up and keep out of debt. In this path only may be found relief.

Mr. Ford's Page

THE world is full of wise and unwise talk about simplifying methods. This talk is always unwise when it limits itself to methods and ignores mind. Simplifying the mental processes until the clearest simplicity of vision is attained, is the first thing to be desired, and having done that, some of the methods we have been trying to simplify will not be simplified at all—they will simply be abolished. It is most pathetic to see men striving to learn a better or a different way to do some things which very soon will not be done at all.

Many well-meaning minds are busy trying to devise machinery which will settle strikes or snuff out disagreements that may lead to strikes. Every now and again the country is interested to hear of some new enterprise along this line. The number of good men and women working at what we may call post-mortem jobs—things that cannot possibly do any good—is quite extensive. It would almost seem that some greater, simpler master mind had planned a lot of useless activity into which these good people could empty the energy of their good intentions and be blinded to the uselessness of their work by being kept busy.

> *MANY people are busy trying to find better ways of doing things that should not have to be done at all. There is no progress in merely finding a better way to do a useless thing. There comes a time when, instead of making dead branches less ugly, the ax should be laid at the root of the tree. In our industrial life we are instituting courts and boards and other agencies to settle matters that should never arise. Instead of going to the root of the matter and eradicating the evil cause we make elaborate arrangements for permanently dealing with the distressing effect. This, of course, is nonsense. It would almost seem that a good deal of this halfway work is purposely invented to steer people away from the real causes of things.*

The number of those who square away from the whole business and scrutinize it from a distance, is very small. Very few ever take time to detach themselves from the fog which hovers over the general thinking and look at life and its institutions as a stranger with strange eyes, and then tackle the matter according to what they see in that examination. No, most of those who are generous-spirited enough to busy themselves with problems of our common life, just march into a previously prepared blind alley, and make themselves believe they are doing something useful because they are discharging an emotional desire to do something useful. If they would only stop to ask themselves who should want them to walk into this hole or that, who should be happy to see all the world given up to this half-baked plan or that fantastic attempt, they might learn something by that method.

Take the machinery for settling strikes, as it has recently been set up in one part of our country. It doesn't pretend to abolish strikes, but to settle them. It assumes that there will be strikes. It expects that there will be strikes. It is founded on the belief that every little while something will come to the surface to prove the fallacy of industrial practice as at present conceived, and that it will be a chance for a few wise men on a Board to show their wisdom by soothing that outburst without interfering with the general wrongness out of which that outburst came.

Now, it is to be admitted, of course, that settlement of a strike by the Board is a great simplification of the older method of settling a strike by violence and hatred and loss and dire need. But would it not be a much greater step in the way of simplification if matters were arranged so that there would be no strikes to settle? But, of course, to say that is entirely too "simple" for those who want to continue a bad condition for the sake of the work and the glory of putting it temporarily right.

Recently a gentleman of excellent ability in his profession and the best of intentions was appointed to be a sort of general "settler" or "simplifier" of industrial questions in his part of the world. He was a good man. He meant well. He wanted things to be right. But he had not an idea in his head that he had not read or heard from the professional reformers. He thought the labor question was a matter of tennis courts and parties around a manufacturing plant. He was still in that stage of "uplift" where a dance hall in the shop or a free turkey at Christmas represented to his mind peace and good will between what he called "capital and labor."

Now this man set out upon his travels, lured by the tale of a shop that had never had a strike. "There," he thought to himself, "I shall find the newest and the latest and the best devices for keeping workingmen from striking." So he came and inquired. Was there a library? No, there was no library—a shop wasn't a reading room. Well, was there a swimming pool? No, there was no swimming pool; the men earned enough to possess bathtubs in their homes and to belong to swimming clubs. Well, then, perhaps the good will of the employes was kept by organizing them into singing societies, or getting up baseball contests between them? No, nothing like that in this factory at all; we're here to do things and to make the doing pay every doer, that's all.

The man was plainly bewildered. His idea was that industrial peace was maintained by passing cookies among the workingmen. He thought that the atmosphere of the ice cream social was necessary to productive, profitable and peaceful industry. Why did he think so? Because he had read it; he had heard theoretical reformers say so. And so he had set out to discover the newest methods of namby-pamby stuff which is supposed to be the real reason for industrial peace. It was what he had been taught to expect. He was prepared to do nothing more than to show employers how to be "nice" with their men in a very cheap way. It never seemed to enter his head that, as a free man, he was at liberty to dig deeper into the subject of industrial rights and industrial wrongs if he wanted to.

He was of that type which is afraid to suggest to employers or employes that there is something deeper. He was afraid of the employers, of course, because they put him into his job. They put him there merely to act as a sort of social secretary between bosses and men. That is, he was to perfume and be-ribbon conditions that needed the ax at the root of them. He may be somewhere yet pursuing his journeys in search of lollipop "solutions" of the "question of capital and labor"—one more good man kept busy on a wild goose chase.

The first step in "shop welfare" work is to pay the men enough to provide for their own welfare. That's the first step in simplification. But it is usually the last step taken. Take that step and you may dispense with your industrial tribunals, your industrial police, your industrial organizations which raise just as bad tyrants on one side as there are on the other; you may dispense with your insulting interference in the men's personal affairs; you may dispense with the whole army of "welfare workers" who are really a tax on the people whose "welfare" they seek. Why, by taking that single step of paying a sufficient wage, you wipe out automatically the whole strike situation with its complex organizations and its enormous taxation.

Why don't employers take that step? Because it means harder work for them. The best wages can only be paid where managers have sweated their brains to find the best methods of making the very best utility at the very lowest cost—and that is not the easiest thing to do. In a sense every strike begins in the incompetency or unfairness of the front office—for incompetency and unfairness in the office very soon sends the same sort of spirit down through the organization. When management finds ways of enabling labor to do what it can do, it can find ways of paying what labor needs and earns. There is no industrial situation which ultimately does not come to a head in the matter of wages, for wages represents livelihood, and a livelihood is at the very basis of civilization. Why not, then, go to this fundamental matter first, and make unnecessary this whole hodgepodge of "welfare" and "sociological" experiment? As good social engineering, why not?

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Three Centuries of Fame on Boston Common

Where Witches Burned, Cows Grazed, Red Coats Strutted and Patriots Died; Where the Regicide's Cheese and Mop Triumphed Over the Duelist's Rapier

By MAY B. WHITING

BOSTON without its Common is as unthinkable as a pot of beans without the pork. It is the mirror in which the grave old city has watched itself at work and play for almost 300 years, the stage on which has been acted, in shifting pageantry, the most striking episodes from the history of the Commonwealth. "Most used and most abused park in the world," is its title, and we can add with equal justice, "most dearly beloved."

In 1634 the land was bought from William Blaxton, the original settler, as a "trayning field" and for the "feeding of cattell." Then the Common was hilly pasture land, with one or two straggling trees, a pond, and the "great elm," already full-grown when the white men first saw it. Marshes on the south extended to Charles River and Back Bay, with a little beach at one end used by people coming by boat from Cambridge or Roxbury. Oliver Wendell Holmes thus pictures it:

"With spongy bogs that drip and
fill
A yellow pond with muddy rain,
Beneath the shaggy southern hill
Lies wet and low the Shawmut
plain."

But those old settlers took their Common, like everything else in life, seriously. They passed a law forbidding any one to "annoy" it. It soon became the social center of the town. Women used to do their washing under the "great elm," bringing water from the Frog Pond and building fires to boil the clothes. The young fry used to gather about the wishing stone, a bowlder near what is now the Joy street entrance, and, after sunset, it was the favorite resort for strollers. At nine the curfew rang, and after that the constable went around to "gather in the loose people."

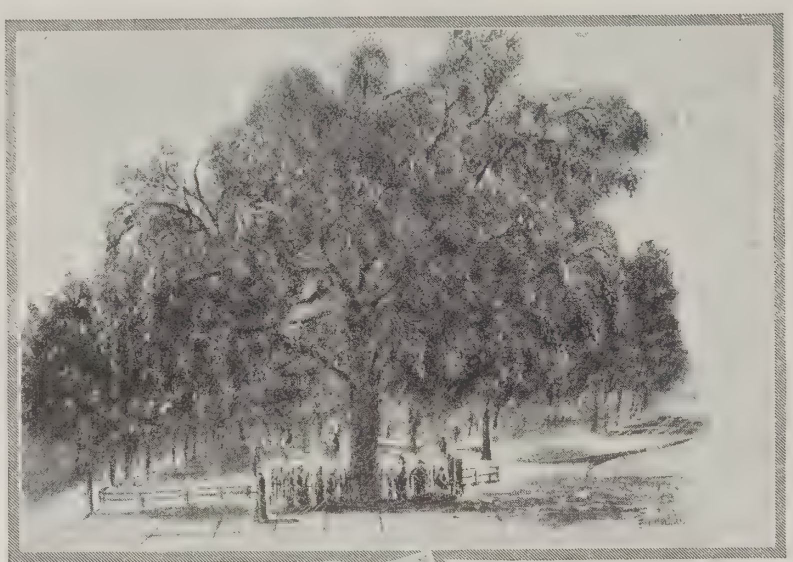
About the middle of the seventeenth century a fencing master came over from England to dazzle the rustics. He set up a platform on the Common and strutted up and down upon it, defying any one to cross swords with him. It happened that General Goffe, an escaped regicide, was then in Boston and he accepted the challenge. For a shield he carried an enormous cheese wrapped in a cloth, and for a weapon a mop which he wet in the gutter. He received the first thrust of his antagonist in the cheese which held the blade long enough for him to wield the mop with telling effect. The braggart, dripping with dirty water, was obliged to abandon the stage amid the jeers of the delighted onlookers.

But few of the "acts" on the Common were farces. On the branches of the "great elm" two witches were hanged, and beneath its boughs a whole band of traitorous Indians were shot and buried. It was the rendezvous for several duels, the most notable being between Benjamin Woodbridge and Henry Phillips. Young Phillips escaped to France where he died, within the year, of remorse, and Woodbridge lies buried in the Granary Burial Ground close by, so near the sidewalk that you may read the inscription on his grave between the palings.

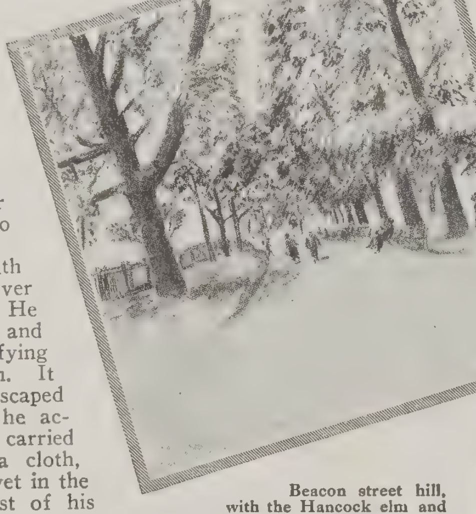
The eighteenth century staged many a stirring episode on the Common. The year 1701 was welcomed in typical Puritan fashion. Judge Samuel Sewall has the record in his diary: "Just about Break-a-Day Jacob Amsden and 3 other Trumpeters gave a blast with the Trumpets on the Common near Mr. Alford's. Then went to Green Chamber and sounded there till about sunrise. Bell-man said these verses a little before Break-a-Day which I printed and gave them." The verses are poor enough but we can imagine that Bell-man was not lacking in fervor when, at Break-a-Day that wintry morning, he read, "Tame Thou the rigor of our clime."

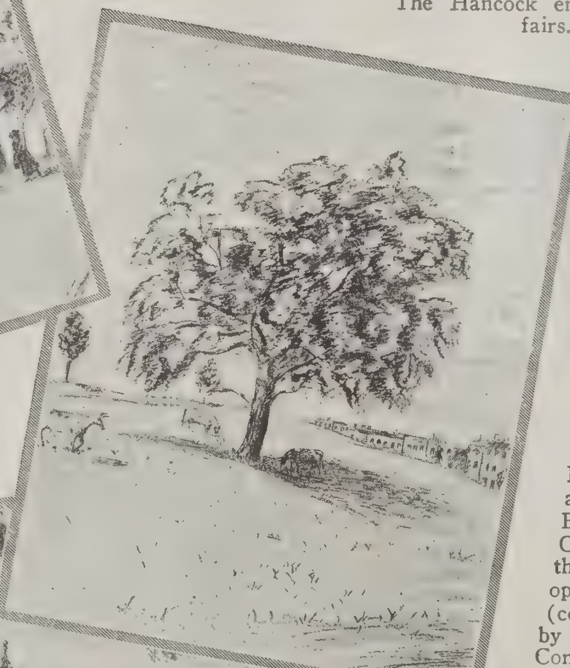
One of the prettiest "turns" of the Common must have been that of the spinners. It was the hobby for women to repair to the Common in the afternoon with their spinning-wheels, and the Boston *Evening Post* of August, 1753, gives an account that makes interesting reading, especially between the lines. "In the afternoon," it says, "about 300 Spinners, all neatly dressed, and many of 'em Daughters of the best Families in Town, appeared on the Common, and being placed orderly in three rows, at Work, made a most delightful Appearance. And a long Train of Gentlemen of Note, both of Town and Country, walked in Procession to view the Spinners."

In 1729 the first trees were planted. They were set out parallel to Tremont street and the walk was called the Great Mall to distinguish it from the walk along the Burying Ground, known as the Little Mall. Thomas Hancock built his mansion on what is now Beacon street and just below him lived the artist, Copley. Gradually the life of the community began to drift from the water front up the hill.



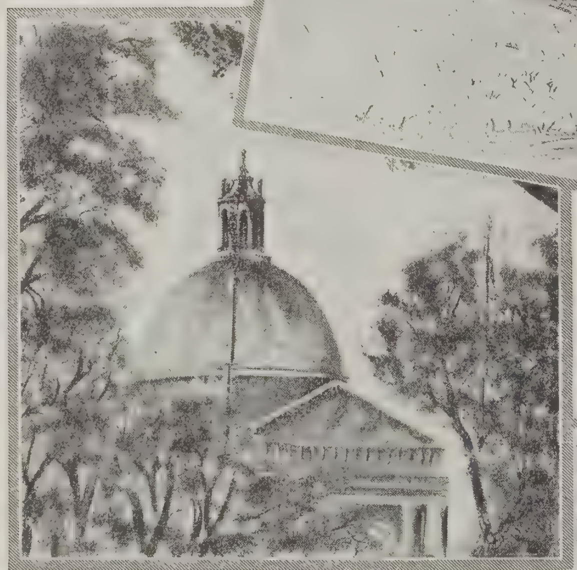
The "great elm" in 1865.





Beacon street hill, with the Hancock elm and Gingko tree in foreground.

A hundred years ago on Boston Common



The "Gilded Dome" from across the Common.

From the very year of its purchase the Common was used for military purposes. The colonists were always in fear of an attack by the Indians and kept a beacon surmounted by a tar barrel in readiness. In 1745 Sir William Pepperell assembled his men on the Common and sent them off for the capture of Louisburg. This "uncommonly rash adventure" was successful and was celebrated with "good liquor" and bonfires for the "less polite." The French sent a fleet of vessels for revenge and soon 6,000 men appeared on the Common, each with a pack containing a bushel of corn, provision for 14 days. But a tempest scattered the fleet and the men returned home, their mettle untried for the present.

Before long the stage was set in earnest for a military show. Troops trained daily on the Common, and, according to a certain John Andrews, with no small success. "I assure you," he writes, "to see 'em you'd scarcely believe your eyes, they are so strongly metamorphos'd. From making the most despicable appearance, they now vie with the best troops in his majesty's service, being dressed all in blue uniform, with drums and fifes to each company, dress'd in white uniforms, trim'd in ye most elegant manner."

And presently the Common was thick with Red Coats. So closely were they huddled together that disease was rife among them and many were buried in trenches in the Burial Ground adjoining. On the highest mound, where now stands the imposing Army and Navy Monument, they placed their guns during the siege. From the foot of the Common they embarked on their luckless expedition to Lexington, and from it they marched to their scarcely more fortunate encounter at Bunker Hill. But their desecration of the Common was what roused the animosity of the citizens. The schoolboys waited on General Gage in defense of their right of coasting, and when the soldiers cut down or mutilated the trees, the ire of the townspeople knew no bounds. The newspapers, fairly beside themselves, referred to Gage as "that Crocodile and second Pharoe," and to his men as "Lobsters and Canabels."

At the close of the Revolution life lost a little of its strain and took on something of ease and grace. John Hancock, who inherited his uncle's estate, was a man fond of elegance and ceremony. He set out a row of lime trees on the Common and provided a band for the afternoons. But the Sunday vigilance was not relaxed and even the governor himself was fined for taking a turn there on the Lord's Day.

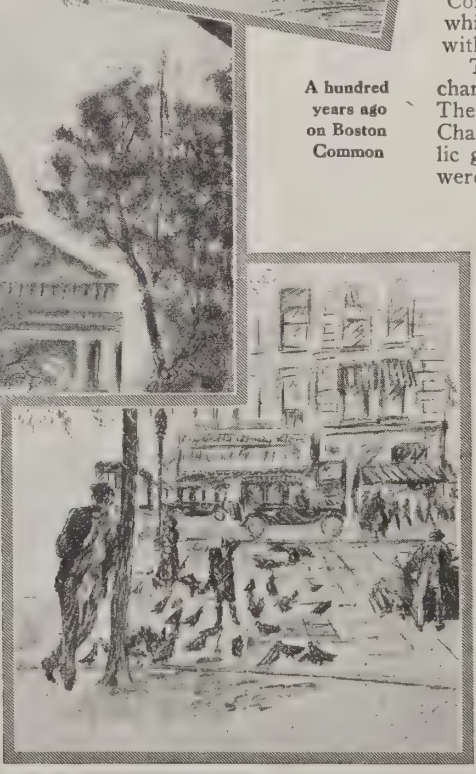
The Hancock entertainments were wonderful affairs. There should have been a chronicler to preserve the fame of the old mansion as Hawthorne did that of the Province House where the royal governors lived. At one time Hancock invited d'Estaing of the French fleet to breakfast. The admiral accepted, but asked leave to bring his officers, and Madam Hancock, put to it to serve 300 men on short notice, sent out her servants with pails and pitchers to milk all the cows grazing on the Common.

During the Civil War the Common was the scene of recruiting, of receptions to returning regiments, and musterings-out. The Webster Regiment, commanded by Daniel Webster's son, Fletcher, sang, as the story goes, "John Brown's Body" for the first time on the Common, as "America" was sung for the first time in Park Street Church opposite. Colonel Shaw's Fifty-fourth (colored) Regiment is commemorated by one of the finest monuments on the Common, the bronze by Saint Gaudens, which depicts in bas-relief the soldiers with their leader.

The nineteenth century saw many changes in the aspect of the Common. The marshlands, extending below Charles street, were filled in and the public gardens set out. Not until the '30's were the cows banished and 20 years later Smokers' Circle, where users of tobacco were obliged to withdraw, was abolished. The children flew kites in summer, skated on the Frog Pond and coasted on the long malls in winter. The sleds were elaborate, some, like the Highlander, costing more than $200. Bridges were erected for pedestrians, but accidents occurred, and the sleds finally went the way of the cows.

But strolling is a pastime that has flourished through the centuries. Daniel Webster, Edward Everett Hale, and Rufus Choate always took their daily turn on the Common. On one of its malls, Emerson tried to persuade Whitman to omit portions of his "Leaves of Grass." Dearest of all strollers are Oliver Wendell Holmes and the Schoolmistress. The Autocrat thus recounts the most momentous walk of his life:

At last I got out the question—"Will you take the long path



On Boston Common.

Poverty That Forbids Fresh Eggs, Bars Babies and Creates Misery Told by Professors' Wives

Young Matrons Declare They Cannot Afford Families on Small Salaries Paid University Instructors

"Slums of Culture" Hideous Reality Amid California Plenty; Conditions Same Everywhere, Is Charge

By ZOE PARKER HOFFMAN

IN A document unique in collegiate history, young wives of University of California faculty members charge that economic pressure and low salaries have driven them into lives of poverty and privation that make it impracticable for them to have children. They charge that:

Economic reasons have caused the preaching and practice of birth control in university circles.

Some families of faculty members have had no eggs for months at a time and some have used butter substitutes for years.

One couple with a baby sleep, eat and cook in the same room.

The children of the laborer of the present day are better off financially than those of the college professor.

The only economy that in time enables them to live on their salaries is to have no babies.

Wives of faculty members wear old clothes and are ashamed. A woman with a child of 12 is still wearing her trousseau.

Wives and children of some well-known faculty members are dressed entirely by the charity of friends and relatives. One woman has not had a pair of high shoes in five years; one has worn the same winter hat for seven years.

It is five years since some of them have been to a theater or even a movie. Many do not have money to cross the bay to San Francisco twice a year.

It never occurs to any of them to buy a book. They must save by skimping, doing all their own washing without washing machines, denying themselves all things of the "higher life," and, finally, the joys of motherhood.

Have Figured It All Out

FAMILIES of professors and assistant professors are living in crowded quarters and in garrets in beautiful Berkeley, under conditions of greater denial than practiced by the families of laboring men. The document, a protest, an appeal and a defi, was issued by wives of faculty members banded together to attract attention to their plight. It was published in the current issue of the *University Chronicle,* the official academic quarterly of the campus.

The young matrons have declared a virtual strike against motherhood under present conditions. "Give us more money and we'll have children," is the defi of the wives, through their spokesman, Mrs. Harold Bruce, wife of Professor Bruce of the English department.

In Berkeley, machinists get $10 a day, chauffeurs $8, milk wagon drivers $8, coal men $7. The young college instructor gets $100 a month. Last year a new schedule was arranged calling for $1,800 a year, but a shortage in funds has made the increase impossible in many instances. Under the present salary schedule, Mrs. Bruce and her associates point out, no wife can afford to have children until her husband becomes an associate professor, which is usually when he is about 40, and his wife is a few years his junior. The salary then received is $275 a month.

The statement of the wives is entitled, "The Prospects of a University Professor's Wife," and in addition to Mrs. Harold Bruce, the following signed the document: Mary Woodle Adams, wife of Professor G. P. Adams of the philosophy department; Amelia S. Allen, wife of Professor J. T. Allen of the Greek department; Mattie Zander Bell, wife of C. H. Bell, assistant professor of German; May Chase Freeborn, wife of Stanley Freeborn, assistant professor of entomology; Katherine S. Linforth, wife of Professor I. M. Linforth of the Greek department; Grace Montgomery, wife of Guy Montgomery, assistant professor of English; Ruth Petersson, wife of T. Petersson, assistant professor of Latin, and Kathleen Tolman, wife of E. C. Tolman, assistant professor of psychology.

"The birth of two babies at $500 each would cost the instructor $20.80 a month for four years," the statement says. "The birth and care of two children in four years would add from $40 to $50 a month to the already numerous expenses of the instructor."

Older faculty women, wives of professors of highest salary, endorse the statement fully, and declare it is impossible for younger instructors to live decently and to have families on the salaries they receive.

The statement came in the nature of a shock to the state at large and to the members of the board of regents of the university in particular.

The one note of cheer to University of California officials was that other universities are "in the same boat."

"It is true not only of California, but of universities all over the country, that professors do not receive salaries that are conducive to the support of a family," says Mrs. E. Dershaw, wife of Assistant Professor Dershaw, of the physics department. In this connection, Mrs. John P. Buwalda, wife of Professor Buwalda, of the geology department, says:

"Professor Buwalda and I were at Yale University last year and we saw very little difference in the salaries paid there and here, and there was little difference in the standards of life of professors there and here. It is a known fact that professors' salaries are outrageously low. By common consent faculty wives stint and save and do without in order to get along. Magazines have long poked fun at professors and their wives and their hard struggle to make ends meet."

Coming to the defense of the university is President David P. Barrows, soldier and veteran of the Siberian campaign. The head of the university in a statement declares his belief that the present budget plan is "adequate and may stand indefinitely until social conditions in America appreciably alter. It may be said at once and positively that universities cannot compete with the financial rewards of private business. The attractions of a university career to men of intelligence and personality must remain other than financial. The university professor, like the man who enters the army or navy, must, unless he has independent means, be reconciled to the prospects of remaining a relatively poor man."

In the meantime, instructors are compelled to take odd jobs outside of their regular work at the university, to work late afternoons and evenings at all sorts of occupations to add to their meager income, according to their wives.

Running through the document of protest is the note of despair at facing old age, the ghost of ever-present want, the sacrifice and privation in families where there is one or more children. And dominant throughout is the hint that what Margaret Sanger tried to do in vain on account of the interference of United States laws, the women of the university are doing openly and gladly—limiting motherhood. They are doing it, they say, against all their most influential instincts, against the longing that they have for happy family life, the laughter and the companionship of children. Grim necessity compels it. This they say repeatedly in the course of their signed statement. Babies are termed as "luxuries."

Old Age Haunts Poor

THE specter of old age looms in the statement that one faculty member was dying and was supported only by subscriptions taken up from the faculty. Another professor after 20 years of service suffered a complete breakdown and his wife, after 20 years of housework and children, is now trying to support him and her three children by making lamp shades and flowers.

Debt, haunting, inescapable debt, often invades the households of faculty members. "Most certainly, it is not only instructors and assistant professors with children who find it impossible to live on their salaries," says the statement. "To take a not unusual case, a man who has been an associate professor several years, who has no children but who has a wife, a partly dependent relative and slightly more than the average amount of illness in his family, in spite of doing without pleasures, books and proper clothes, is obliged to spend every month from $30 to $50 more than his salary. In consequence, he can give little time to research, and although he and his wife are well over 30, they have to face the fact that they cannot yet afford to have a child."

Ill health and accidents are a calamity of double moment, it is pointed out. "Unhappily it is not possible to live always without dentists or doctors or even operations," the statement continues. "But the wives of some professors simply have not had necessary operations. Yet all that is not enough. The only economy which in time enables us to live on our salaries is for us to have no babies."

Not only the instructors, but their wives also, are compelled to do outside work, they declare. "More and more faculty wives are going to work outside their homes, some because their earnings are absolutely necessary to keep the family going, others because they prefer mental work to the monotony and physical hardships of housework." Practically every faculty man, they declare, must do work other than his university duties. The result of this, it is declared, is that he is overtaxed physically and mentally and has no time to devote to necessary research activities.

"The wife must make most of her own dresses and all her nightclothes and underclothes. She must make her husband's nightclothes, use the tails of his shirts to patch the necks and turn his cuffs. If the wife is clever and if she knows how to sew, it allows them to have clothes of a quality sufficiently good to keep them from being constantly ashamed."

"Minimum" Budget Prepared

OTHER faculty wives have hastened to add a word to that of those who signed the protest. "The dollar of 20 years ago is worth about 50 cents today," asserts Mrs. Alex F. Lange, wife of Professor Lange, dean of the school of education of the university. "Families of professors were never very large, but it is only in the last five or six years that economic reasons have caused the preaching of birth control in university circles. Certainly it does not seem fair that a man who has given years of preparation to his work should not be granted some of the privileges of other classes. To be born in the professional class means the immediate assuming of certain responsibilities. There are no large families in university circles. The largest family I know of in this present generation consists of three children. Two is an average family. Children simply are not being brought into the world, that's all, for the simple reason that the younger people to whom we look for the propagation of the race cannot afford to have them."

Mrs. Bruce, leader of the protestants, has, with the assistance of her collaborators, prepared a budget of a minimum on which two people can live comfortably, denying themselves luxuries. It calls for $153.25 to $155.25 a month. The budget is based on the first year after marriage, when both parties have their trousseau clothes. This allows from $6 to $7 a month for meat, $3.60 for milk, $3.50 for eggs and $20 for groceries. Rent is fixed at $35 and operating expenses, light, gas, fuel, telephone, and so on, at $32.50. Newspapers, magazines, club dues and general "development" call for $28.10, including charities. Ten dollars is allowed for a "rainy day," life insurance, and so on, and $8.50 for bank savings. The second year expenses increase considerably.

As a result of the statement leaders among women's organizations and other civic bodies have been considerably agitated, seeing a menace in a situation affecting the leaders in American educational life, those upon whom it devolves to teach patriotism and loyalty to American institutions. Mrs. W. H. Marston, president of the second district, California Congress of Mothers, was prompt to ask:

"What is to become of our nation if these leaders in the intellectual and moral development of the present day refuse to bring children into the world? College graduates are taking the question of motherhood seriously. I know of one sorority at another university where a definite check is being kept on the number of children born among its members. The cry is for better childhood, yet if these fine people represented in our American universities are not encouraged to have children and the other irresponsible group continues at its present rate of multiplication—what is the answer to be?"

As a result of the protest of the faculty wives it is expected that universities throughout the country will have attention drawn to the California situation and will await with interest the result of the effort to increase faculty salaries. In the meantime, other universities are expected to follow in the wake of the western institution in investigating the problem.

American Woman Gives Her English Estate for Cause of World Peace

Victoria Martin, Exiled at 33, at 83 Honored as Pioneer of Anglo-American Friendship

By PAUL TYNER

In oval—Victoria Woodhull Martin in 1877 when she began her English career. Below—Elizabethan manor in Worcestershire presented by Mrs. Martin to the Sulgrave Institution.

A RECENT cablegram tells us that "Mrs. Woodhull Martin has given her splendid Elizabethan manor in Worcestershire to the Sulgrave Institution, formed to foster friendship between Britain and America." This announcement followed close on the report that at a meeting of the board of governors of the Sulgrave Institution at the American Embassy in London, steps were taken to form an International Sulgrave Board, of 50 Americans and 50 British members and to vest the Sulgrave Manor property in a joint British and American board of trustees of 18 members. It was also announced that President Harding had promised to give to Sulgrave Manor an elm tree from Mount Vernon and Mrs. Harding a cutting from Martha Washington's rose tree to be transplanted to the grounds of the home of Washington's ancestors in old England.

Perhaps not one newspaper reader in a thousand realized the greatness of the gift of that Worcestershire manor and the illumination it sheds on the character of the donor, for more than 40 years its chatelaine. On the merely material side alone, it means the endowment of the Sulgrave Institution, "formed to deepen and foster friendship between the peoples of Britain and America," with an estate worth probably $100,000.

In the center of a beautifully wooded demesne on the slope of Bredon Hill, the old manor house is a massive gray stone and ivy-clad structure of Tudor architecture dating back to the early part of the sixteenth century. It has sheltered generations of lords and ladies, squires and dames. Its upper windows command one of the most beautiful of English landscapes and one about whose broad spread of moor and undulating valley cluster historic associations of largest interest. Only four miles away where the Avon and the Severn join their waters and within a stone's throw of the ancient Abbey of Tewkesbury, was fought in May, 1471, one of the most decisive battles in English history. It was at Tewkesbury that the hopes of the House of Lancaster were shattered by the crushing defeat of the beautiful Margaret of Anjou, the Queen of Henry VI., whose young son, Edward, Prince of Wales, was murdered soon afterward. So ended the long-drawn-out Wars of the Roses, the Red Rose of Lancaster crumbling in disaster while the White Rose of York was born in triumph by the victor who mounted the English throne as King Edward IV. Overlooking the fair valley of Shakespeare's Avon, Norton Hill also overlooks the scenes of many hard-fought battles between Roundheads and Cavaliers in and about Worcester only a dozen miles away.

I shall not soon forget a visit I made to Norton Park one autumn day in the first year of the war. My hostess met me in a motor car at Eckington station, little more than a two-hour run from London, and took me to Norton Park by a road that wound through woodland and meadow. It was dusk when we arrived and the somber anxiety that oppressed all England at that time, with a dawning realization of the desperate nature of the gigantic struggle upon which the nation had entered, seemed to be reflected in the heavy gray skies and the damp chill of the air, as in falling russet leaves. The pale, thin, black-garmented figure beside me seemed almost a wraith—a visitant from another world. She had been living in retirement in this country home of hers for some 15 years and the impression of frail health was perhaps emphasized by the fact that she was only just recovering from the effects of a serious automobile accident. Already in her seventy-fifth year, it was difficult for me at first to identify her with the Victoria Woodhull who in 1872 ran for the Presidency of the United States, waging a whirlwind campaign that stirred the country from center to circumference and made her a national figure hardly less conspicuous in the public eye and ear than her opponents, the Victor of Appomatox and the veteran founder of the *Tribune*. Yet, as we talked in the car and later while seated in her comfortable library before the cheerful blaze of a log fire, an occasional flash of the eyes, or a quick movement of the hands, reminded me vividly of this remarkable woman as I first beheld and listened to her—a spellbound boy—during a campaign speech she made in Cooper Institute, New York. She was then in the very ripeness of her powers, a strikingly handsome woman of 33. She had a dynamic personality to which her short hair and what was then considered "mannish" dress but lent added intensity. Endowed with a voice of rich mellow tone, admirably modulated, and speaking with the earnestness of deep conviction, great self-command and an evident knowledge of her subject, she commanded close attention, gradually working her listeners up to a pitch of enthusiasm that burst into frequent and hearty applause.

Victoria Woodhull had already gained fame as a courageous pioneer of the movement for woman's emancipation. A short time before, she had presented a memorial to the Senate and personally argued the cause before the House Judiciary Committee, insisting with decided force and logic that there was no basis in the Constitution for withholding the ballot from women.

Those were the palmy days of the "Lyceum" in America and, as a lecturer on social reforms, Mrs. Woodhull had established a reputation that placed her beside such popular lecturers as Wendell Phillips, John B. Gough, Henry Ward Beecher, Ralph Waldo Emerson and Theodore Parker. When a mere girl she had begun her platform career as a Spiritualist speaker, riding the crest of the wave of Spiritualism that swept over the country following the famous "Rochester Rappings." She was, indeed, then as pronounced a champion of Spiritualism as Sir Conan Doyle is today. She was the candidate of the newly organized "Equal Rights Party" and her running mate was the late Frederick Douglas, that valiant leader of the colored race in America. The ticket received a popular vote of respectable proportions. Grant was the regular Republican nominee; Horace Greeley headed the Liberal Republican ticket which had been indorsed by the Democrats. Issues carried over from the war were still dominant; but the currency question was beginning to define itself in the assertion in some quarters that "the money that was good enough for the soldier fighting the country's battles should also be good enough for the bondholders"—a cry met in the platforms of the two major parties by protests against "direct or indirect repudiation of the nation's obligations." Demands for the allocation of public lands to actual settlers instead of to railroad corporations and for reform in the civil service also stood out conspicuously. Woman Suffrage was then regarded as an extremely radical idea and too visionary to figure as an issue in practical politics. In the platform of the Equal Rights Party, and in the speeches of its candidates, it was frankly made the chief issue and linked up with unassailable logic to the cause of Negro emancipation, for which the greatest civil war in history had been fought, and declared to be inseparable from all earnest advocacy of justice, liberty and genuine government of, by, and for the people. "Are women not people?" was the question propounded.

The platform of the Prohibitionists, alone among the other party platforms, also came out squarely for equal suffrage, declaring that "the right of suffrage should be conferred without regard to sex."

For years, she told me, she had been engaged in the preparation of memoirs which would constitute a history of her own time from the angle of the social evolution of woman.

People generally in Britain at this time were predicting that the war would be ended in a few months; that the boys in khaki would be out of the trenches and back in England in time for their Christmas dinners. But Mrs. Martin clearly foresaw that it would be a long and bloody struggle beyond all precedent. She also foretold to me that the United States would enter the war on the side of the Allies and that our entrance would be the decisive factor. Even the date of our coming into the struggle was predicted with what proved a remarkable approach to exactness.

She nourished the conviction, however, that even out of the black frightfulness of it all, great good was sure to come in an ultimate drawing together of the nations in friendly unity and cooperation, a rapprochement which would be initiated by the example of America and Britain, following a deepening and strengthening of the ancient blood ties between these two great branches of the Anglo-Saxon people that should arise out of their comradeship in arms and common love for peace.

Mrs. Martin had, in fact, been a pioneer in Anglo-American friendship. She was a prime mover in the movement for the marked celebration of the centenary of the Treaty of Ghent—of the hundred years of peace between Britain and the United States preserved along a 3,000-mile frontier without a fort or a gun. This movement in England centered around the purchase and dedication of Sulgrave Manor, the English home of the Washingtons. And it is significant that it was Mrs. Martin who gave the first thousand pounds for that purpose.

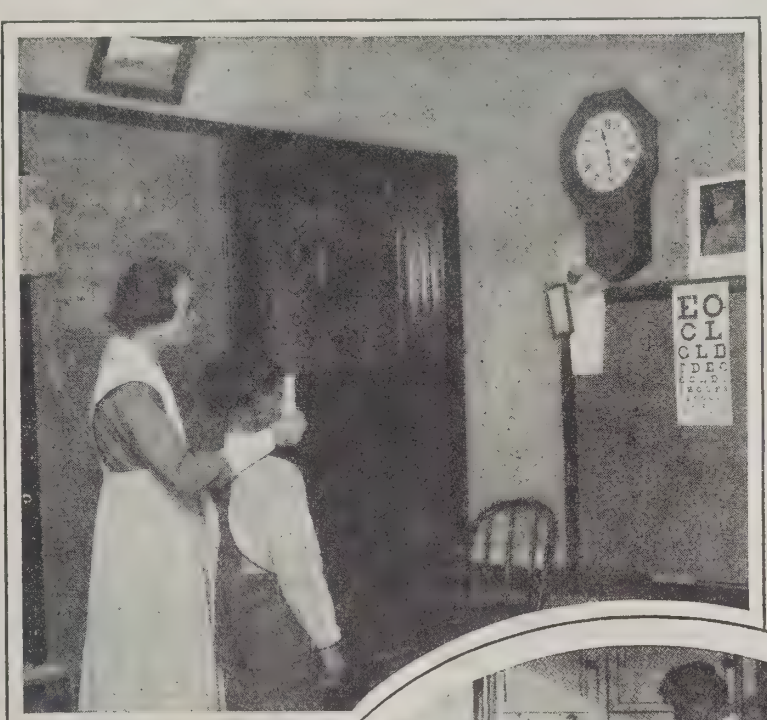
For Healthy Manhood and Womanhood

All Free on Child Welfare Special With Its Way Stops Everywhere

By FRED L. HOLMES

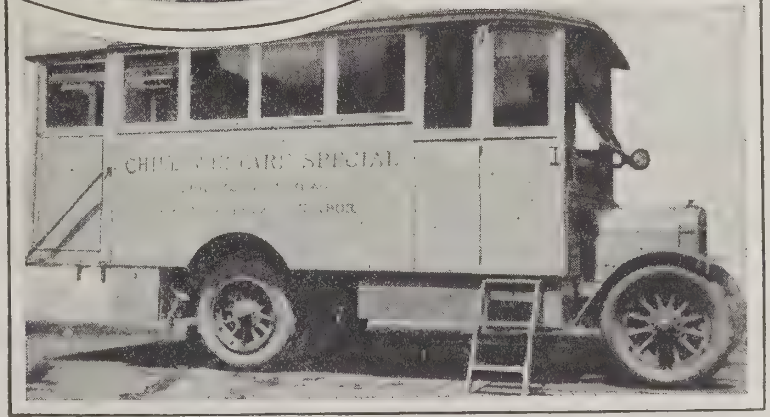
YOUNG, healthy children, with ruddy cheeks, and strong virile manhood, with sun-tanned face, are almost always associated with the country. Fresh air, fresh milk, fresh vegetables, abundant opportunities for exercise—natural living, all make us believe that life in the country does not require the social agencies that the congested unnatural life of the city needs. These impressions or associations of country life are to a considerable degree unfounded.

Draft statistics of rejected men from rural communities aroused the country to the existence of a rural health problem. Since then nearly every state has sought for remedies to relieve conditions. It is a problem national in its scope. It touches every home. It is a proposition of how to save 100,000 babies of the nation who now die annually, through neglect and failure to understand properly the health rules; how to restore health to thousands of others whose young lives are blighted by curable maladies.



At left—County health nurse testing child's eyesight.

Below—Testing baby's heart in public health clinic.



The Child Welfare Special, the state and national governments' answer to the need of health education and hospitalization in rural communities.

To teach the mothers the care of children; to instruct the pupils in the care of their bodies and health; to inculcate into families lessons on sanitation, have been the mainsprings back of the movement in several cities and states to solve the problem. The "Child Welfare Special," fostered by national and state governments, and the county health nurse are the government agencies of the solution offered. Both are accomplishing results.

The "Child Welfare Special" is the name of a big government truck operated by the Children's Bureau of the United States Department of Labor. It is being used as a movable child welfare station to carry to remote regions the gospel of health hygiene. In utilizing this plan the Federal Government followed in a general way the experiments made by the traveling dispensaries used in Cleveland, Ohio; Vermont, Connecticut, New York and Michigan, and especially of that used by the Chicago Tuberculosis Institute in Cook County, Illinois.

This rural health car weighs four tons and is propelled by a 35-horse-power engine and the body of the car is mounted on a one-ton chassis. It is a hospital on wheels. The exterior of the truck is painted battleship gray and the interior enameled white. The main room of the truck body is 6 by 9½ feet and is used for a conference room, especially equipped for the examination of children. A utilization of the chauffeur's cab provides a dressing room. The truck is lighted by four windows, two feet square, sufficiently high to be beyond the reach of prying eyes. For night work this traveling hospital is equipped with electric lights, supplied by current from the truck's own batteries or by some convenient building near by that has electric power. The two electric heaters keep the car comfortable in moderate weather.

Many of the conveniences of the modern hospital have been provided. There is a 15-gallon tank of water piped to a stationary washstand in the front corner of the car. Around the walls of the cab are stereopticon slides and miniature models showing good ways to bathe, clothe and feed young children. Large posters hang from convenient places illustrating various phases of child welfare work.

In most of the states, and especially by the Federal Government, these "child welfare specials" are in charge of a staff composed of either a man or woman physician, who has practical knowledge of rural people and conditions and who has aptitude for advising young and inexperienced mothers in the care of their health. There is a special nurse, who can give mothers practical information on the feeding of children in their rural home.

Besides the Children's Bureau at Washington, four states and several cities are now using the "Child Welfare Special" plan to combat the high mortality death rate among children. Specials are used in the following places:

Cleveland, Ohio—Bureau of Child Hygiene on the Municipal Health Board, Dr. R. J. Ochsner, director.

North Carolina—State Board of Health, Raleigh, Dr. W. S. Rankin, secretary and state health officer.

Minnesota—State Board of Health, St. Paul, Miss Frances V. Brink, supervisor of nurses. (This is a traveling baby clinic, active for some three years.)

Indiana—Division of Infant and Child Hygiene, Dr. Ada M. Schweitzer, State Board of Health, Indianapolis, director.

Wisconsin—State Board of Health, Dr. C. A. Harper, Madison, director.

While these states have been moved to activity in utilizing the new plan, the Children's Bureau Special of the Department of Labor has been doing extensive health work in five states. In Indiana, a complete tour was made of Shelby County; in Kentucky, it toured the counties of Union, Madison, Jefferson and Daviess; in Illinois, the counties of Morgan, Greene and Williamson; and in Arkansas, the counties of Jefferson, Faulkner, Pope, Pulaski, Saline, Nevada, Columbia and Washington. How the health special has aroused interest in Cleveland is shown by the following report:

"The Children's Special caused persons in all walks of life to think about baby conservation. It was a popular publicity feature and so became educational by catching the attention of all sorts of people. The mother who naturally shuns the baby welfare center had for once the center brought to her in so attractive a form that she was deeply interested and immediately became a convert to the policy of seeking help from the center whenever the baby needed attention."

From Connecticut came the statement:

"Perhaps the most far-reaching accomplishment of the Baby Special was the arousing of the small and rural communities to their need of child welfare work. Before the coming of the Special, many of these communities had thought their children were well taken care of, because they had plenty of fresh air and milk. Many of the towns that were so apathetic and indifferent now realize that these things alone do not make for healthy and strong children, and a number are making plans for permanent child welfare agencies."

As the Child Welfare Special of the Federal Government has been working only since 1918, few health statistics in communities visited can be obtained. But the reduction of the infant death rate as a result of educating mothers is demonstrable from other sources.

Reports from the Boston Dispensary, made by Michael A. Davis, director, show a remarkable reduction in death rate for infants under one year of age where the mother was given preliminary instruction and care. The records give the death rate of infants under one month of age per 1,000 births as follows:

Prenatal Care

1914	17.3
1915	25.9

No Prenatal Care

1914	46.5
1915	39.7

This is a record which shows the saving of from 12 to 29 lives out of every 1,000 births by reason of an educational campaign.

The results obtained at the Maternity Center Association in New York City were similar. Records were compiled by L. I. Dublin, statistician. Out of 4,496 supervised cases, the death rate to infants under one month per 1,000 births was 19, while the Manhattan rate, where no supervision was given, averaged about 45 per 1,000. The death rate among mothers was equally pronounced at the Maternity Center in New York. Out of these 4,496 supervised cases there were two deaths out of every 1,000 mothers, while in Manhattan the death rate was 5 per 1,000 births.

Striking figures were furnished by J. H. Larsten, of the New York Milk Committee, showing results of an experiment in prenatal care carried on during 1912-1916. Out of 3,077 supervised cases there were 86 deaths among children under one month of age, or a rate of 27.9 per 1,000 births. The infant mortality for Manhattan, where 349,688 cases were unsupervised, were 13,621 deaths, or a mortality rate of 39 per 1,000 births. Supervision and prenatal care resulted in preventing nearly 11 deaths out of every 1,000 births, or a reduction of death rate of 28.4 per cent per 1,000 cases. Among mothers the supervised cases resulted in a death rate of 1.5 per cent per 1,000, while in the city at large the death rate among mothers was 4.9 per 1,000.

Cities lead the way in community nurse movements. Rural sections are just awakening to the plan. The introduction of the health nurse into rural communities is doing much to battle down high death rate among children. Wisconsin is the only state in the Union that has a compulsory community health law. The plan has not been put into complete operation, but when it is every county in the state will have a nurse to wage a campaign against disease and to teach prevention lessons to the younger generation.

More than 30 counties have the plan in operation. Traveling from home to home, from schoolhouse to schoolhouse, from community to community, the Wisconsin county nurses have found that they have a big health program. Rural school children get the same medical inspection as city children, and if parents are too poor to have their children treated the county health nurse finds a way. She is truly a health angel.

With the county as the health unit, co-operating with the state department of health, it has been possible to push the work into the most inaccessible Wisconsin rural districts. By the terms of the law, county committees are created to co-operate with the nurses.

In the schools and at county fairs in Wisconsin the children are being weighed in the presence of their parents and the defects of the child pointed out. In hundreds of schools the children are being fed a certain amount of milk each day.

All school children are given a physical examination. The rural health nurses report the occurrence of diseases; teach first-aid lessons in case of accidents; instruct the mothers in the care of their infants, and help to get the blind and the defective into institutions where they may be cared for. Some of the counties have established medical and dental clinics for the treatment of poor children, a plan operated so successfully in many of the larger cities of the nation. Children who are kept fit have little trouble with school work.

Deeds, Few Words, Mark Advance of Fascism in Taking Over Italian Power

New Force, Unique in National Movements, Rapidly Attains Domination

By A. R. PINCI

WHO are the Fascists? Fascism is a new word in modern political nomenclature, based upon an ancient Latin symbol, and because it became current shortly after the English language was enriched by the addition of similar war-born expressions and designations, its exact meaning has remained obscure. But perhaps that is not solely the fault of lexicologists; even in Italy the word is somewhat elastic, comprehensive but not quite definable. The reason is not difficult to find; fascism today is a symbol that awaits to be translated into action, and that action may follow swiftly and positively.

Fascism, briefly, represents the awakening of the youthful element of young Italy, an Italy that seems to have little in common with its present government, its national religion, and its fancied aspirations. Fascism is sponsored by the element of the male population that believes in having something to do and doing it; it is anti-Socialist, anti-Communist, anti-clerical and anti-bureaucratic. It is as yet rather mixed, but it is undeniable that its aims are modern and progressive. If it fails in bringing about a new order of things as rapidly as critics would have it, it is due to the impossibility of fostering—as history repeatedly proves—a nationalistic movement of any kind against vested or potential interests.

To understand fascism it is important to remember that Italy is a new nation that is emerging from its ancient and thick chrysalis of feudalism, bourbonism, ignorance and clerical autocracy. That Italy, during the 52 years of its unity, could have done much better than it has done in this regard, goes without saying, but this progressive evolution has been obstructed by neighboring governments, by foreign interests and by the virtual impossibility to gather together men capable of governing during this formative period.

Italy Seeks Another Crispi

ITALY has had one Crispi; Italy awaits another Crispi. The *Fascisti* believe that there is not only such a man in Italy today, but that there are any number of them. To bring him to light and to confer upon him the office of statesman it is necessary beforehand to get rid of the driftwood and the bureaucracy that is strangling the kingdom.

What the fascists are trying to do in Italy today is just about what Americans in the United States, Britons in England, and Turks in Turkey are endeavoring to bring about. One hears much against the Democratic and Republican parties, or rather, what is left of them, and along comes the suggestion to create a new group that would know how to give the nation its just dues; in London the murmurs against the last sad remains of a coalition government are becoming definitely anti-Lloyd George; and the Turks, thanks to the nosiness of foreign meddlers who consider the Turk a person to be freely insulted, are rallying in the name of a modern and efficient Ottoman nation.

The fascists can best be described as anti-monopolists. Whether they in turn, given that they will achieve national power, as now seems to be the case, will become monopolists, is conjectural. At this time they have shown unusual, in fact, surprising, restraint since they have been obliged to counteract the evil effects of a Soviet-inspired Bolshevism in a few Italian communities, and they had to meet force with force. Work which strikers abandoned they have undertaken to do, plus this novelty—that the loafers were forced to leave the towns where they expected to command as bosses.

The fascists, moreover, are young men, the majority being on the nearer side of 20 than of 30, but all of whom in their present state of mind regard their lives as worth nothing in their eagerness to attain their ends. It was this trait that made them such irresistible adversaries in communistic Genoa last July.

Act Promptly in Strikes

I HAVE seen them run the street cars of a city. The uniformed conductors and motormen, who had decided to strike for some fancied grievance, did not look upon these chaps as strike breakers, for they were not. The fascists have no intention or inclination of serving as strike breakers. They are not looking for work, and whatever work they engage in is incidental with the particular reform they are undertaking Of their earnestness of principle and intention of seeing it through, strikers and communists have had no opportunity to doubt, because in every case they have submitted to this new army. It is worth noting that violence throughout these difficulties has been noticeably insignificant. Most of it has taken the form of corporal chastisement.

The fascists, among other things, are trying to prevent the ominous, if not suspicious, readiness with which workers, governmental or private, coerced their employers or intimidated government (national or municipal) officials to grant their obstreperous demands. In this, of course, they saw the bond between communistic and socialistic deputies in the Chamber. It is undeniable that representation—though this was not intended—of both Communists and Socialists in the Chamber of Deputies gave comfort and security to the bands that affected these imported doctrines. As usually happens when ignorant masses experiment with novelties of this sort, they were unknowingly the tools of men higher up, both in office and out of office, seeking office or determined to stay in office.

The Socialist movement reached its zenith under Nitti in 1919. At that time fascism was under way but not yet developed. The nearest thing to it was Irredentism, sponsored by the soldier-poet D'Annunzio. I happened to be visiting Rome the very day that the latter's dramatic flight to Fiume was announced; a few days afterward I had an opportunity to analyze French reaction in Paris itself. It became evident to me then that Italian observers belonging to this new school of national thought were stationed in Paris as, indeed, they have visited other international centers. The march of several thousand fascisti the first week of October into Trenth and Bolzano is a direct and related result of the Fiuman incident.

D'Annunzio's coup was a direct challenge to the Nittian group; the recent occupation is a direct challenge to Facta, Giolitti and Nitti. The latter two ex-premiers are mere wire-pullers, but they manipulate marionettes that the fascisti are minded to eliminate once forever. There have been reports, rather laborious, that the Council of Ministers was ready to adopt repressive and severe measures against the fascisti, even to the extent of naming "cavalry and artillery." To those that are informed these reports must have occasioned a dozen smiles, for the very thing that the Italian cabinet is not sure of is the army, since most fascists are ex-soldiers.

The cabinet itself is far from being unanimous about ways and means against fascism, this because there are two or three members who are in utmost sympathy with its aims and ideals. Moreover, Premier Facta and the men behind him (or some of his cabinet colleagues) are quite apprehensive over the results of measuring steel with the fascists. Thus the government is beaten before starting. The government is on the defensive. It seems disinclined to permit the deciding of the issue by lawful methods—the elections, while the fascists, through Benito Mussolini, their leader, are demanding a showdown through suffrage.

With the fascists willing and anxious to submit their case to the voters, and with the government itself unwilling to agree, it would appear that the government is hardly sure of itself. The cabinet, as constituted at the time that Mussolini made his declaration, represented an invisible government contested by two factions: Giolitti and Nitti.

Against Present Government

THE fascists, of course, are decidedly against the government, for the reason that it is not a government but a mask for the factions headed by the two ex-premiers. The present government has lacked stability, confidence, purpose and policy. It has endeavored to attain all four. The results have been dismal.

In reality, therefore, the present struggle is between the representatives of this new movement and the representatives—tried and found wanting—of defeated and even desecrated former governments. Giolitti had to flee for his life nearly eight years ago, and that Nitti still lives to hope for restoration to popular favor he owes to the army that protected his life, as premier, three years ago.

Giolitti and Nitti are representative examples of that governing class known the world over as long on promises and short on deeds. What Giolitti has promised that he has failed to deliver is a long list—not to count his deliveries of that which he had not bargained to bring and that nobody wanted. Nitti, a few years ago, as Minister of the Treasury, sponsored a program for the economic resurgence of Italy, but when he became premier and had both opportunity and authority to try his panaceas, he forgot all about them. Meanwhile, he is writing books—as seems to be the general malady with public and ex-public men of Europe now—about saving the world.

If fascism, therefore, is taking pains to show impatience against this sort of political buncombe, it is merely putting into action what, for instance, countless American citizens are feeling against broken party promises and eternization of cheap politics. Italians have had less experience at self-government, in point of time measured from the beginning of the present kingdom, than any other nationals of a first-class power, but despite this inexperience the public in general looks forward to the advent to power of the fascists without trepidation. What the fascists could and would do was the chief topic of discussion on trains, and I traversed a good part of Central and Northern Italy lately. Many persons believe that Italy's resurgence is a problem of new thought and new action, while nearly all others, apart from entertaining any hopes of perfection in government, are quite ready to support the party which holds out the promise of doing things, for better and for worse, considering that the present negative condition is due to the misgovernment of former cabinets.

Another matter of paramount importance is that which deals with foreign help of financial nature. For two or three years Italy has received a great deal of foreign money from more or less mysterious sources. Russian gold has been merely incidental, and has not amounted to as much as energetic publicity would have us believe. Not all "Russian" gold came from Russia. Not a little of it was from a much closer source. Money, needless to say, is always the mainspring that gives energy to subversive movements, and most of the communistic troubles of the kingdom have been *paid for.* One half of this gold has paid for wine, wine that has flowed and is still flowing too freely in the thousands of *osterie* (wine shops of vulgar type) and those who have tasted of this wine are elements that the better class of thinking Italians has recognized as political free lances, adventurers and spies.

If perchance there is any one disposed to question this utterance I shall give in advance this counter argument; that not one of the strikes, disorders, and campaigns has been waged for the sake of economic betterment or for lack of bread. Socialists and Communists, each in his way, have sought, it is true, to obtain a greater share of worldly goods, but only by means of Sovietism and division—by taking from those who have; not one has suggested to work for it. The masses, on the other hand, despite prevailing difficulties, have not lacked bread; food was never so plentiful and extravagance never so obvious.

Has 4,000 Millionaires

ITALY has her poor, but she has also her millionaires, which exceed 4,000! Two own more than 50,000,000 lire; 1 more than 40,000,000; 18 between 20,000,000 and 40,000,000; 69 between 10,000,000 and 20,000,000; 467 between 4,000,000 and 10,000,000; 332 between 3,000,000 and 4,000,000; 860 own 2,000,000 and 3,369 own between 1,000,000 and 2,000,000. These are real millions, not printing press millions, even though they represent a depreciation from pre-war parities.

The fascists do not belong to the school of easy-money getters; that is, they do not profess to believe that Socialism, radical or moderate, is logical. If anything, they represent a diametrically opposite view, because they foresee that furthering the socialistic doctrine may lead the people at large to obtain something for nothing. It is their aim, by means of efficient administration and rationally assigned work, to provide a living income for those willing to work, in contradistinction to the present state of affairs, where the most prosperous "men about town" are those without visible means of support.

Of course, no one foresees absolute success in this, for if the fascists were able to bring about such a nearly utopian state of affairs in their own country, they would soon be overwhelmed with requests from foreign countries to "clean up house." It is undeniable, however, that the absolute zero of incompetence in governmental efficiency in Italy is near. If Italy cannot go forward something is bound to happen because there is not much leeway for going backward.

The Fascists Are Young Men

UNFORTUNATELY it happens that the fascist movement, as well as motive, is quite misunderstood abroad. For this one may account, in part, for the propaganda countenanced by governments inimical to Italy. The secret disbursements of these governments for the purpose may never be known, although they have been the talk of foreign offices for some time. Even in Washington official circles there has been some knowledge of it.

In addition, many editors have shown singular apathy with regard to a venture in new government that should be of especial interest, for news reasons alone if nothing else, at this time of universal lukewarm government. It is only recently that the editors of a very important American daily, in reply to a reader's query, explained that the fascists are a sort of male flappers! Then, of course, we marvel why readers are unenlightened. Another explanation that I heard, from the lips of a serious American, was that they represent a new type of Communist executioners because their symbol is an axe.

Fascismo, to repeat, is a borrowed arbitrary term, based upon the *Fasces,* bundles of rods usually made of birch, with an axe (*securis*) projecting from the middle, which were carried before the chief magistrates of ancient Rome as symbols of their power. Valerius Publicola directed that the fasces be lowered at the assemblies of the people as an acknowledgment of their supreme power.

The men who have rallied under this symbol are a rather odd lot. Many of them are ordinary wage earners who go about on their own business until such time as they are called to duty. In this respect it is not unlike the army system. These breadwinners respond to the call, perform their duty, disband and return to their employment. Of course, there are any number of them who are unemployed, and there are many more who receive compensation from property owners who have recognized in these young men the spirit of policing that, aimed against insurgence among the mob, is the province of the army proper to disband.

The fascists, however, are not constituted into an army but into a political party that at a moment's notice can become an army. That there is an invisible bond between them and the rank and file of the army is undeniable, but it is undeniable, too, that their intentions are peaceful and nothing more. Had the fascists ever intended to start a revolution the opportunity existed often and long ere this.

Gyro-Stabilizer Ends "Roll" of Huge Ships

120-Ton Wheel Acts Quickly, Takes Up Motion of Seagoing Craft

By WILLIAM A. M'GARRY

OUT of a child's toy that has been the foundation for many another useful device in recent years, science now has developed a machine to prevent seasickness. Equipped with it, the largest passenger liner, or the smallest, will be able to plow on a relatively even keel through heavy seas so that even the poorest sailor among her patrons may laugh at *mal de mer*. The machine is not an experiment. It has been tested on yachts, battleships and transports, and now for the first time it is to be applied to the passenger liner.

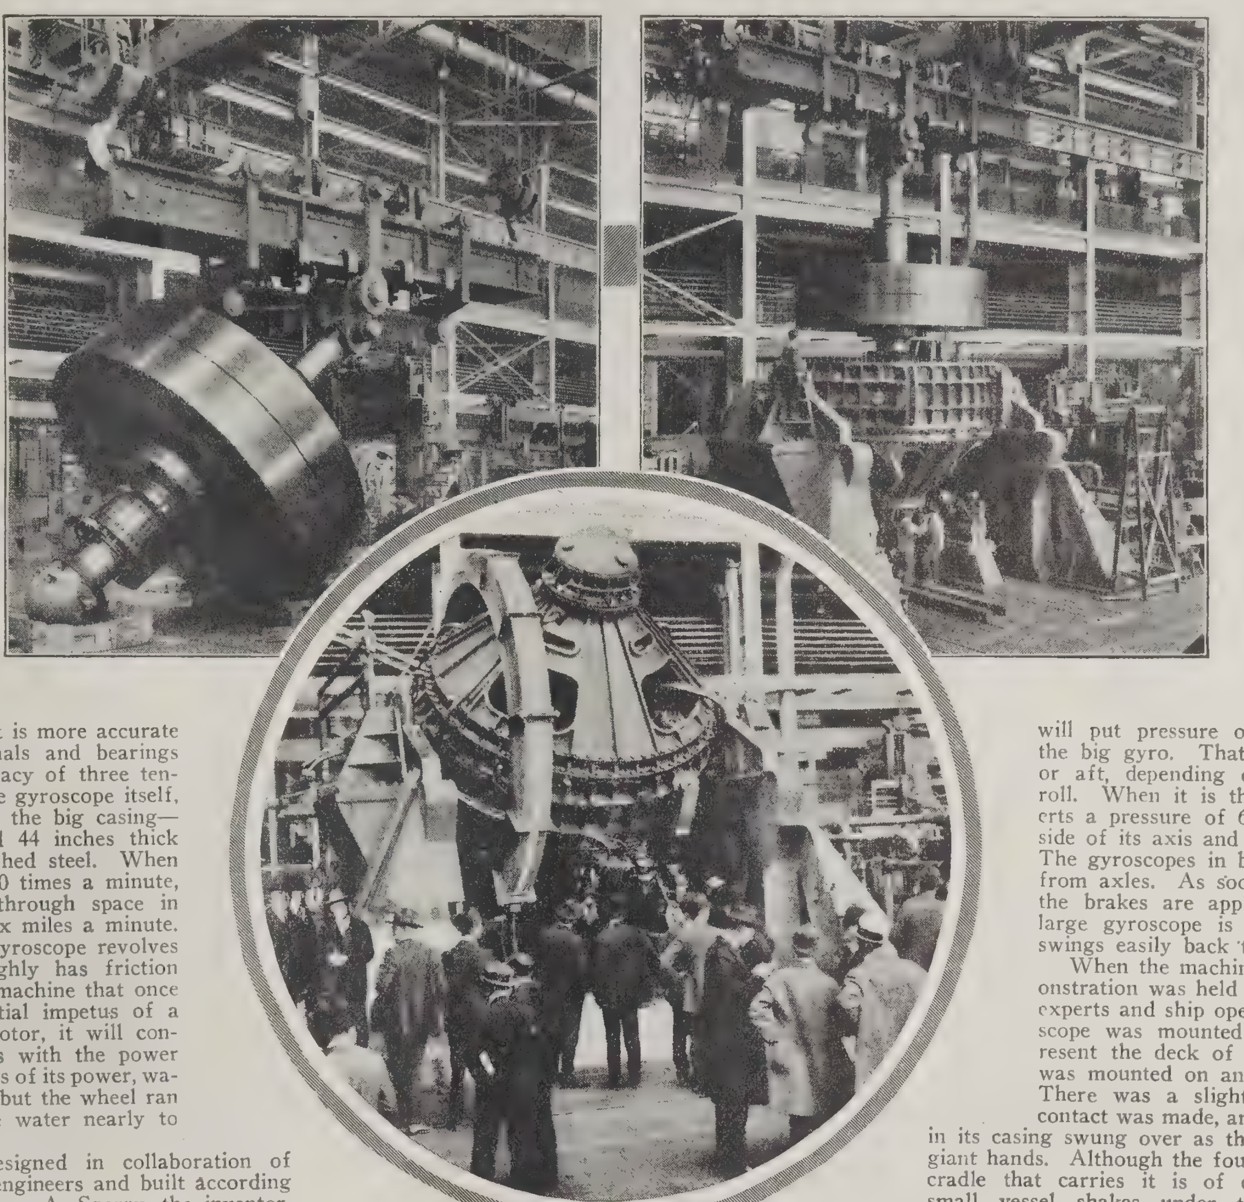
The machine is the Sperry gyro-stabilizer, which, roughly speaking, is nothing more than a highly intricate and delicately balanced improvement on the familiar gyroscope top of childhood days. At the South Philadelphia plant of the Westinghouse Electric and Machine Company workmen have just put the finishing touches on the largest gyro-stabilizer ever built, and within a few weeks the device will be installed in the 20,000-ton liner *Hawkeye State*, operated by the United States Shipping Board between Baltimore and Honolulu.

Despite the fact that it weighs approximately 120 tons, the huge gyroscope is so well balanced that it is controlled by another gyroscope weighing but 150 pounds. In some respects it is more accurate than a fine watch. Journals and bearings were machined to an accuracy of three ten-thousandths of an inch. The gyroscope itself, or rotor—the wheel within the big casing—is 13 feet in diameter and 44 inches thick and is made of solid, polished steel. When in action it will revolve 800 times a minute, the outer edge traveling through space in the casing at the rate of six miles a minute.

As is well known, the gyroscope revolves in a vacuum. So thoroughly has friction been reduced in this great machine that once the wheel is given the initial impetus of a 250-horse power electric motor, it will continue to spin for 18 hours with the power shut off. Recently in the tests of its power, water was applied as a brake, but the wheel ran for five hours, heating the water nearly to the boiling point.

The gyroscope was designed in collaboration of Westinghouse and Sperry engineers and built according to the specifications of Elmer A. Sperry, the inventor, chiefly famous for his gyroscopic compass and his gyro-shells. The first installation of his gyro-stabilizer was in the U. S. S. *Widgeon* in 1914. Since that date many installations have been made in smaller vessels, such as the yacht *Lyndonia*, owned by Cyrus H. K. Curtis, Degar Palmer's Diesel electric-driven schooner *Guinevere*, and many other pleasure craft. When the transport *Henderson* was launched it was so equipped. Of 10,000 tons, it was the largest vessel up to 1921 to have a gyro-stabilizer. The machine worked so well that a number of other installations of similar size have been made on naval vessels.

The application for a stabilizer for the *Hawkeye State*, however, marked an epoch in ocean travel. That vessel is 535 feet long with accommodations for about 700 persons, including passengers and crew. There was no mechanical problem that had not been solved in the earlier installations, but some additional developments were made. One thing the gyro-stabilizer will do for the *Hawkeye State* is to roll her when necessary. Frequently a big vessel runs into a shoal and much time is lost before she can be drawn off because of the rapid filling in of the silt around her keel. With the stabilizer she will be able to rock from side to side in such a manner as to wash out a new channel to deeper water.



Left—The huge wheel before being put into casing. Right—Lowering gyroscope into casing. Circle—Test of the gyro-stabilizer at Westinghouse plant. In its inclined position the machine is exerting a pressure of 600 tons.

The big gyroscope will be installed aft of the engine room and parallel with the decks of the ship. The smaller machine will run parallel with the side of the ship. Two machines are used to save power and provide quick action. The small one revolves 5,000 times a minute. It is so sensitive that it registers a ship's roll a fraction of a second after it starts, and through the electrical control panel, starts the big stabilizer in a direction that counteracts the effect of the roll in less than a second and a half. With the machines in action it is contended by the experts that it will be impossible for the ship to roll more than two degrees in either direction off the level, and that amount is so negligible that even a poor sailor cannot notice it uncomfortably.

The principle of the gyroscope is well known and it is the only thing involved in the stabilizer equipment. Any change in equilibrium is resisted by the centrifugal force exerted by the spinning wheel. The greater the speed of the wheel, the more sensitive its response to a loss of exact balance. That is the reason that the small control gyro is used. When the roll of a ship starts, due to the action of a wave, the small gyro by seeking to retain its balance will put pressure on the switches, starting the big gyro. That can be swung forward or aft, depending on the direction of the roll. When it is thrown off balance it exerts a pressure of 600 tons, upward on one side of its axis and downward on the other. The gyroscopes in both instances are swung from axles. As soon as the roll is checked the brakes are applied and the tilt of the large gyroscope is stopped, after which it swings easily back to an upright position.

When the machine was completed a demonstration was held in the presence of many experts and ship operators. The small gyroscope was mounted on a platform to represent the deck of the ship, which in turn was mounted on an axle and slightly tilted. There was a slight flash as the electrical contact was made, and then the 120-ton wheel in its casing swung over as though moved by invisible giant hands. Although the foundation beneath the steel cradle that carries it is of concrete, it shook as a small vessel shakes under the impact of a great comber.

Operators of passenger vessels expect the installation on the *Hawkeye State* to be followed by many others. The patronage given larger liners which are less responsive to roll indicates how much of a part seasickness and the fear of it plays in the inhibition of travel, and shipping men are hoping that with the stabilizer in general use that fear will be eliminated. The stabilizer will not prevent the pitching of a vessel, of course, which is generally so gentle, at any rate, that it causes little discomfort. The trouble is due mainly to the side roll or the combination of uncertain movements.

Three Centuries of Fame on Boston Common

Concluded from page 6

with me?" "Certainly," said the schoolmistress, "with much pleasure." "Think," I said, "before you answer; if you take the long path with me now I shall interpret it that we are to part no more." The schoolmistress stepped back with a sudden movement as if an arrow had struck her. One of the granite blocks used as seats was hard by, the one you may still see close by the Gingko tree. "Pray sit down," I said. "No, no," she answered softly, "I will walk the *long path* with you."

As Judge Sewall ushered in the eighteenth century, so under the guidance of her beloved citizen, Edward Everett Hale, Boston welcomed the twentieth. At a quarter before midnight there assembled on the State House balcony, overlooking the Common, 200 singers and four cornet players. Sewall's hymn was sung, and Old Hundred, and Dr. Hale read from the Book of Psalms. When the bell on King's Chapel gave the hour of twelve, the vast throng recited in unison the Lord's Prayer and sang "America."

It is now the fourth century of Boston Common. Its first darling, the "great elm," is no more. Its old age was attended by every care but it succumbed to the gale of 1876, and a scion of the old landmark flourishes in its place. Its oldest inhabitant is now the Hancock elm, set out in front of his mansion and directly opposite the Gingko tree, by the distinguished first signer of the Declaration of Independence. At least two links bind the Common of today closely with the past. On the Parade Ground, west of the Frog Pond, the Ancient and Honorable Artillery still go through their evolutions in the picturesque costumes of the colonial army, and here the schoolboys hold their annual drill. Both the Ancients and the Latin School are vigorous survivals of pre-Revolutionary days.

During the World War the Common was the seat of varied activities. Contrary to all precedent, buildings were allowed to be erected on its sacred soil, and welfare huts and cottages dotted its green. But there is no danger of its being wantonly violated, for its place is secure in the affection of the people. An esteemed citizen, George F. Parkman, who lived for years beside it, left about $5,000,000 for its benefit.

Unique among the parks of the world, Boston Common is enjoyed by practically every citizen. As in France, there are birdmen who daily feed the doves and sparrows. Its green is a sort of front yard for the handsome houses on Beacon street, and, in hot weather, the poor come up from the tenements and sleep on the grass. Its benches offer refuge for those chronically or occasionally weary, and its malls are always thronged with strollers, each one of whom will tell you that there is no finer vista in the world than across its wooded slopes to the gilded dome of the State House.

Ideal Currency Is Paper Currency

HERBERT SPENCER said:

ENGLAND herself does not in reality base her currency on specie nor could she without bringing all business to a dead stop in a very short time. She just mixes enough of this specie basis fiction in her finances to continually or periodically divest the laboring classes of their earnings for the benefit of the nobility. But for the real basis of value to her currency, she makes the notes of the Bank of England, as well as her coins, a full legal tender for the payment of debts, but not the notes of the other banks. From this we see that even in England specie basis is a mere fiction, a false pretense.

Depression Cuts Labor's Interest in Unions

Figures Just Brought in England Show Marked Decline in Trades Memberships

By W. P. CROZIER

J. R. CLYNES, the ablest of the English "moderate" Labor leaders, has just asked: "Are there still men who are ready to pocket all that a union can get for them and keep in their pockets the little they should pay to help the union to get terms which all men are eager to share?" This question might very well spring, though in fact it did not, from the publication a few days ago of the official figures of trade-union membership in England. Everyone knew, more or less clearly, that the trade unions had lost members heavily during 1921 and are still losing them. But the actual figures surpass all expectations. Between 1913 and 1920 the total membership of English trade unions more than doubled:

	Males	Females	Total
1913	3,747,000	442,000	4,189,000
1917	4,663,000	890,000	5,553,000
1920	7,131,000	1,362,000	8,493,000

In 1921 not less than 20 per cent of the total dropped off. The decrease in a single year was 1,700,000, of which 1,371,000 was represented by men and 329,000 by women. The causes were various, chief among them, of course, was the trade depression and consequent unemployment, so that many members could not afford to keep up their subscriptions, but there was also the powerful fact that the trade union movement is rather under a cloud. There have been long and disastrous strikes and the greatest of all, that of the miners, ended in the terrible fiasco which broke up the much (though unnecessarily) dreaded Triple Alliance of miners, railwaymen and transport-workers. It is not very astonishing if large numbers of the rank and file of labor, seeing that their leaders have been so unsuccessful in conducting their affairs, have economized on their subscriptions to the trade unions. English commercial history during the last 18 months may be read pretty plainly in the roll call of lapsed members:

Men	Lapsed	Percentage of membership
General labor	491,000	36
Coal miners	211,000	
Shop assistants, clerks, etc.	166,000	44
Railwaymen	111,000	
Engineers, shipbuilders	82,000	
Builders' laborers	76 000	43
Agriculture	61,000	29

Among women several industries showed a decrease of nearly half the membership:

Women	Lapsed	Percentage of membership
General labor	95,000	54
Shop assistants, clerks, etc.	63,000	49
Tailoring and other clothing	38,000	40
Woolen and worsted	25,000	32

As it happens, just when these figures have burst on a depressed labor movement, the trade union authorities have published the results of an inquiry into the various methods and machinery by which English labor makes trade agreements with employers. Mr. Clynes's reproach is addressed to all non-union people—and especially, no doubt, to all the lapsed members—calling on them to observe all the benefits which the trade unions obtain for their members by the manifold forms of collective bargaining which this report surveys. It is an interesting report, and comprehensive: something that has not been done before, giving a sort of bird's-eye view of the way in which English labor settles with the employers the wages and conditions of its work. *

All the highly organized trades of the country operate through voluntary agreements. These are made simply by the workers' associations negotiating with those of the employers, or through the so-called "Whitley Councils" representing a whole industry or through some other form of conciliation or arbitration board. But not all trades are highly organized or indeed organized at all. In some cases, therefore, decisions about wages—rates are legally imposed and the decisions have to be carried out or the offenders can be prosecuted. This is the Trade Board system. The Trade Boards were first established in 1909 to fix a minimum wage in "sweated" industries. (A beginning was made with tailoring, paper-box making, lace-finishing and chain making.) Inquiry had shown in 1906 that in 27 out of 32 textile or clothing trades under investigation, adult women were earning not more than 15 shillings ($3.50) a week a head and a large number earned less than 10 shillings ($2.50) a week. The Trade Board fixes a minimum which should be at least a living wage. In 1918 the system was extended to cover many more trades which have no adequate machinery for regulating wages and by the middle of 1921 there were 61 Trade Boards at work and about 3,000,000 workers came under their protection. This is one of the most beneficent pieces of legislation that we in England have had in recent years and it has done incalculable good to the "sweated" worker. Some employers detest the Trade Boards and not long ago there was a deliberate attempt to ignore their decisions and to cut wages below the minimum. A few salutary prosecutions put this right. But there is still, unfortunately, a movement against the Boards, due partly to the trade depression, and a government committee has recommended that only the lowest-paid workers should have their wages legally fixed, the wages of the other grades being left to voluntary agreement. This means that the wages of the "other grades" would soon be cut down. To all such proposals the reply ought to be made that an industry which cannot pay a decent living wage does not itself deserve to live.

In the field of voluntary agreement there are 70 "Whitley Councils," the formal title of which is Joint Standing Industrial Councils, and 32 similar bodies called Interim Industrial Reconstruction Committees. The difference between the two is that the Whitley Councils are intended to apply to the better organized industries and accordingly they consist entirely of representatives of the employers and the employed in equal numbers. The committees, on the other hand, being intended to deal with industries that are less organized, are supplied with representatives of the Ministry of Labor to assist in producing agreements. There is thus an ascending scale in these negotiating bodies:

(1) for unorganized industries, including those recognized as "sweated"—Trade Boards, whose decisions are enforceable at law.
(2) for industries with weak or inefficient organizations—committees on which the Ministry of Labor assists the two sides with expert advice. The agreements are voluntary.
(3) for organized industries—the Whitley Councils where employers and employed settle their problems without official interference. Here, too, agreements are voluntary.

The joint bodies (2 and 3) together look after the interests of 3,500,000 workers. The miners, ironworkers and cotton operatives stand outside, having their own elaborate machinery for negotiation. (These two classes, together with the 3,000,000 under the Trade Boards, account pretty well for the whole trade union world.) "An indication of the activity of the Whitley Councils on wage questions," says the Labor report, "is seen in the fact that between December, 1919, and May, 1920, 46 national wage agreements were concluded by Whitley Councils." About a dozen sliding scales of wages were also established by them. More generally, they are regarded as valuable because they have brought the workers of different unions into co-operation and because they are at work all the time and not only when a dispute is afoot.

A word should be said about the sliding scales of wages, which have already been mentioned. There are at least 80 in operation and the total number of workers covered by them is estimated at 2,750,000. They were devised as a means to avoid the incessant disputes which sprang from the chase of wages after prices. Even before the war the rise in the cost of living had led to a great increase in industrial disputes, since prices always tend (in England at least) to keep well ahead of wages. From 1906 to 1913 the index figures give the following results:

	Wages (1896=100)	Retailed Food Prices (London) (1896=100)	Number of Disputes
1906	109.4	111.2	486
1907	113.2	114.5	601
1911	111.9	119 3	903
1912	114.6	124.9	857
1913	118.0	125.2	1,497

With the war, of course, prices began to soar skyward and that wages might advance in some regular relation to prices, the first sliding scale was established in 1917 (by a section of the Lancashire textile workers). The scale is really based on the cost of living index number calculated by the Ministry of Labor, and both employers and employed criticise it severely on the ground that, having been compiled nearly 20 years ago, it requires to be overhauled and a fresh calculation made. The principal objection offered by trade unionists to the sliding scale is that it tends to stop any "basic increases" in wages.

---

*Note—"Industrial Negotiations and Agreements," published by the Trade Union Congress and the Labor Party, London.

The Sugar Plum of the North Platte and Who Gets It

By GEORGE C. PORTER

A FEW years ago the writer first entered the irrigated section of the North Platte Valley. Water was running everywhere it was needed. Bounteous crops and brilliant prospects were on every hand. The land was rapidly settling with the sturdiest pioneers. Hopes were high.

Today the water still runs and there are good crops, but the settlers are bankrupt or on the verge of bankruptcy. They are unable to pay the reasonable charges of the government for water and the government has deferred payments. It is true that certain politicians have had their fingers in, to the disadvantage of the settlers, but there have been repeated concessions made by the government, and others are in prospect. Politicians try to center the feeling of discontent against the government-owned irrigation project; but granting everything suggested along this line and the root evil is untouched. Mortgage foreclosures are increasing in frequency. Within approximately a year five banks have failed in this district. The banks failed generally because the patrons of the banks had first failed.

Freight rates on potatoes are now so high as more than to absorb the farmers' profits and in many cases prevent shipments. Aside from potatoes there is another staple crop—sugar beets. If the sugar industry were managed on a live-and-let-live policy its monopoly and large profits could continue indefinitely and the farmers would prosper. This policy is spurned. To support this last statement I want to present some figures and draw some conclusions therefrom:

The Colorado court records show, over Mr. Havemeyer's name, the following statement of the cost of producing a hundred pounds of beet sugar, exclusive of the cost of the beets:

Operating expenses	.81
Maintenance	.275
Interest	.038
General expenses	.048
Total	$1.171

A short time after Mr. Havemeyer furnished these figures, Mr. Petriken, another representative of the beet sugar interests, advised a committee of Congress that, at the later date, the cost of producing 100 pounds of sugar was eight cents less than the Havemeyer figures. This reduced the total cost at the later date to $1.091 for making a hundred pounds of sugar, exclusive of the cost of the beets. There have been some variations in cost since that time, but improved machinery and methods, as compared with later showings, justify the conclusion that the figures quoted are essentially correct for today. I prefer to use the company's own figures.

From an article printed in local papers in this vicinity by the Great Western Sugar Company in February last, I find a statement in the Morrill *Mail* under date of February 9, 1922, in regard to the yield in tons per acre of beets. The statement is made at the close of the beet-sugar-making season and by the sugar company, that the average tonnage per acre in the vicinity of Mitchell and Morrill for last year was 10.84 tons.

The price paid growers for beets this year is $5 a ton.

I am credibly informed by retail merchants at Morrill that they now pay the jobbers at Scottsbluff $8.21 a hundred pounds for sugar, and that the jobbers buy direct from the sugar company at its factory, and with no freight charges paid, at $7.71 per hundred pounds of sugar.

Using the above data as a basis we find the following:

Entire cost of manufacturing 100 pounds of sugar		$1.091
Cost of beets for 100 pounds of sugar		1.613
Note: 15½ per cent sugar means 310 pounds of sugar in a ton of beets.		
Total cost		$2.704
Selling price to jobbers at factory $7.71		
Pure profit on each 100 pounds of sugar		5.006
	$7.71	$7.71
Pure profit on each acre of beets		$168.22
Note: This is obtained by multiplying $5.006, the profit in 100 pounds of sugar, by 3.10, the number of hundred pounds of sugar in a ton of beets, and then multiplying that product by 10.84, the average tonnage in an acre of beets.		
The farmer received, at $5 a ton and an average tonnage of 10.84, a gross return an acre of		$54.20
From this must be deducted outright for contract labor for thinning, weeding and topping		18.00
This leaves the farmer an acre		$36.20

From this $36.20 the farmer has to furnish the land which must be built up several years to be fitted for the intensive farming required for sugar beets. He runs the risk and expense from insects which prey on the leaves of the plants, and from windstorms which frequently destroy the beets when the plants are young and tender. He must deduct outright for seed, irrigation water, taxes, use of machinery, feed and all labor costs, except contract labor, including the cost of hauling to market.

Farming in the irrigated district of the North Platte Valley does not pay. The sugar company had a number of choice farms near Scottsbluff and close to their first factory. They sold them. Gross returns an acre of $36.20 with all the risk, expense and labor to be deducted therefrom before there was a copper for profits did not look good to them. They preferred the present peonage system. It paid better. They preserved $168.22 pure profit for every acre of beets and the handsome additional profits from by-products of which no account is taken in this story.

A New "Richest Village" Displaces Hibbing

Mining Companies of Minnesota Range Practically Sole Taxpayers

By CHARLES NICHOLLS WEBB

FRANKLIN, MINNESOTA, a Mesaba Range village, with a population of 807, has fallen heir to the title long held by another Northern Minnesota community and, although it has no civic organizations to advance its claims, makes the boast, nevertheless, of being the "richest village in the world."

The richest village has not a business district and, with the exception of the village hall and the school building, has not a single public edifice to crown its glory. Its sole industry is iron mining, but the per capita taxable value of real and personal property in the village is $29,247, or more than four times that of Hibbing, formerly the "richest village," which is $5,626. The mining companies which are almost the sole taxpayers have no complaint as to the way the money is spent in Franklin. In 1921 it cost Franklin $763.35, per capita, for governmental purposes, or 25 times the government per capita cost for St. Paul.

The village government was economically administered, the tax commission finds, despite the fact that the 1921 government cost per family was $3,200.

Another village in Minnesota, bearing the name of Franklin, spent one-thirtieth per capita what it cost its namesake in St. Louis County in 1921. The less prosperous Franklin is in Renville County.

The per capita taxable value of Franklin, St. Louis County, is $29,247 as compared to $687 for Minneapolis, $648 for St. Paul, and $728 for Duluth. Much of the mining property is owned by the state and is under lease to the mining companies. Franklin is what is commonly termed, "a mining company town." It adjoins the city limits of Virginia, having a population of 14,022, and gets its mail from that city, having no post office of its own.

Hibbing, farther west on the Mesaba Range, has a population somewhat larger than Virginia, according to the last census. Through its liberal expenditure of public moneys for various improvements and utilities, Hibbing has received a considerable amount of publicity during the past few years. This publicity was invariably accompanied by the slogan, "The Richest Village in the World." Recently, Hibbing was moved bodily by the Oliver Iron Mining Company, to carry on mining operations where the town stood, and the new village was laid out on a scale even more elaborate than before with handsome business houses, well-paved and well-lighted streets, a park system, a million-dollar high school, and the finest hotel in Minnesota outside the Twin Cities. But, at almost the same moment, it acquires this new magnificence, Hibbing loses its title of the "richest village" to a community of mine location houses, which does not even boast a post office.

Scarcely a greater contrast between towns can be seen anywhere than between Hibbing and Franklin. Franklin consists of miners' homes, huge open pits where iron ore is scooped up in five-ton mouthfuls by steam shovels as if it were sand, and the skeleton-like head frames of underground mines.

The mining companies operating in the village are: The Oliver Iron Mining Company, an operating branch of the United States Steel Corporation, The Inter-State Iron Company, Corrigan-McKinney & Company, Coates & Tweed, and The Republic Iron & Steel Company, included in the recently announced merger with Midvale and Inland Steel Company. Most of the mine operation is by the open-pit method, the ore being dug from huge excavations by steam and electric shovels. The largest of these open pits is that of the Oliver Iron Mining Company.

The mining history of Franklin is intensely interesting and epitomizes much of the industrial history of the Lake Superior region.

It is said that a break between John D. Rockefeller and his brother, Franklin, followed a dispute over the Franklin mine, which was named after Rockefeller and which, in turn, gave its name to the village.

The old Franklin mine, which ceased operations some three years ago, began producing ore in 1892 under the management of Franklin Rockefeller. Rockefeller had embarked in the ore business with James Corrigan, of Cleveland. They had purchased the Franklin, had put $300,000 into a fleet of lake boats, and had gone on a hunt for other iron-ore properties.

In the early nineties the iron business suddenly struck hard times. Corrigan borrowed heavily from John D. Rockefeller, first $46,000, then $80,000, and then $45,000. Still larger sums followed. The result was that Mr. Rockefeller soon had all of Corrigan's interest in the oil trust in his hands, according to chroniclers of this period of industrial history.

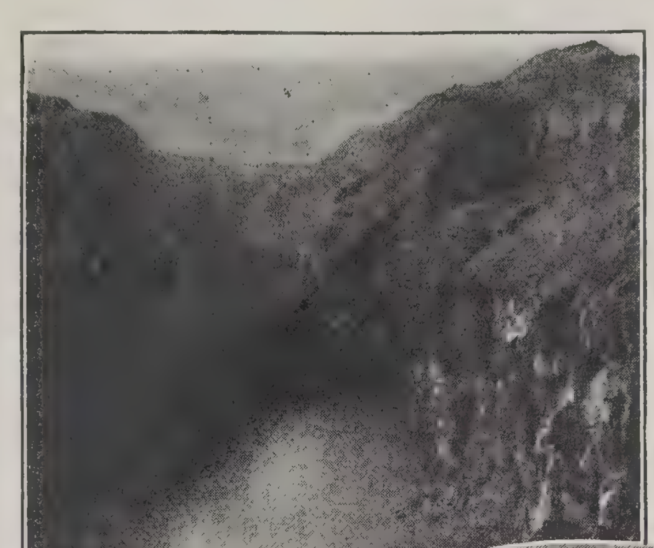
Later, when Corrigan was hard-pressed, Franklin Rockefeller, his partner, went to John D. to obtain his aid and the brother is said to have obdurately exclaimed, "Corrigan is going to the wall, Frank. I might as well have his stock as anyone."

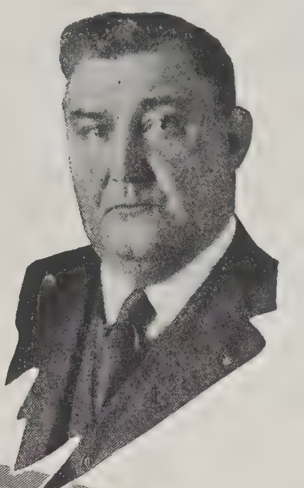
According to Ida Tarbell, this marked the parting of the ways for the two brothers.

Franklin was not the "richest village" when Rockefeller had an active part in its mining affairs. It was an unorganized tract and later included in the township. Its incorporation as a village took place some eight years ago and was bitterly opposed by the neighboring city of Virginia, which coveted the rich taxable value of its ore lands.

Franklin Rockefeller was a frequent visitor in the early days. His private car was often sidetracked for weeks at a time near the Franklin mine. He was fond of sitting on a stump or a bowlder at some distance from the mine, silently watching the surface work for hours at a time. He was plain and unostentatious and showed a keen interest in the industry in which he had embarked at such an unfavorable time.

Although he was keenly aware of the great wealth of the district, he did not dream that the squalid location of miners' houses would some day be called, "The Richest Village in the World."





Top, left — The Norman pit, no longer operated, showing the depth of open-pit mines, and the manner in which they fill with water when abandoned. Right -- Captain John Dickinson, President of the Village of Franklin. Oval —The Missabe, a mine owned by the state and operated by the Oliver Iron Mining Company.

Another view of the Mesaba Mountain.

Wall Street Control of Cotton Prices Costs Millions Yearly

Concluded from page 3

cotton. The small proportion of real to fictitious cotton dealt in on the New York and New Orleans Cotton Exchanges may be known, when we consider that the total sales on these exchanges per annum aggregates 75,000,000 bales. There is no way to secure accurate figures on this subject, as the clearing house of the New York Cotton Exchange is a secretive organization, giving out no information whatever of the total sales. Even brokers of the Exchange do not know the approximate amount. Some light was shed on the volume, when an auditor of the clearing house of the Exchange testified at a recent trial of a smaller cotton exchange in the Criminal Court of New York that the sales on the New York Cotton Exchange approximated 45,000,000 bales a year. Therefore, for both the New York and New Orleans Exchanges, the estimate of 75,000,000 bales is probably correct. Of this colossal amount hardly a half million bales* represents real cotton, which goes to show the enormity of speculation involved, or 99 per cent of the trades based on "paper cotton" as against only one per cent on real cotton for the legitimate needs of trade. And these exchanges act as barometers of the state of demand for cotton!

Future exchanges cannot function as essential markets so long as speculation is allowed to crowd out legitimate trading. The needs of the situation call for Federal laws to strike directly at speculation, especially short selling, by compelling the seller to furnish a receipt showing that he owns spinnable cotton, or holds an option on the amount that he wishes to hedge.

Free speculation, as now exists, causes prices to be radical, uncertain, illegitimate, up 100 points one day and down 100 the next day, and forever nerve-racking to the trade. In recent years, prices have covered a wide range and speculation has grown to such proportions that the Exchanges have had to pass rules forbidding prices to fluctuate more than 200 points from the close of one session of trading to the close of the following session.

Speculation has cost the farmer, who is the backbone of American commercial and social progress, *more than fifteen billion dollars in the past 30 years.* Short selling costs him from 25 to 40 per cent of the profit on his product. It is the grim reaper of the profits that he should have.

There are many reasons exchanges should be rigidly controlled or else abolished. Prices are no more or less than a commercial structure built on confidence. Trade activity expands and prices rise as confidence swells in the business outlook. Prices may be compared also to a fabric in which there are interwoven the movements of prices in general.

Operators on such leading exchanges as the New York Cotton Exchange can form a pool to break the market. They begin by heavy short selling, in such volume that the trade cannot absorb it. Prices break. What is the next result? Prices in the southern spot markets drop. Trade buying in the dry goods market hesitates. The New York Cotton Exchange is looked upon as the barometer of the cotton and commercial outlook. If the hammering of prices continues, buying in the spot and dry goods markets shrivels up, and buying disappears in allied trades. Prices in those markets sympathetically fall. Business can be and is wrecked in this way.

The farmer is the first sufferer. His suffering extends to the retail merchant from whom he must necessarily buy less. The retail merchant in turn cuts down his purchases from the wholesale merchant, who then cancels his orders to the mill. Stagnation in trade comes. All of this because a group of operators in Wall Street seized the opportunity to break the cotton market.

Cotton-future exchanges, on the other hand, can be useful as insurance markets. Growers owning cotton can protect its price by hedge sales on the exchanges, that is, by selling contracts against their stocks. Should a break occur in the market, they are protected, as their cotton has been sold on contract at higher prices.

Future exchanges belong with race-track betting, political trusts, the days of Tweed, houses of vice and liquor selling. The new conscience must not permit vicious speculation to wreck the fortunes of agriculture and endanger American prosperity. Future exchanges should function only as markets of insurance.

---

*Note—The Exchange publishes reports of the amount of raw cotton traded in, but gives no estimate of the trading in speculative cotton.

Loan to Liberia Means Domination by U. S. of Rich Coast Region of Africa

Affairs Would Be Placed Completely Under American Control; Nearly 40 Per Cent of Amount Suggested Takes Up Old Obligations

By AARON HARDY ULM

IN THAT quaint part of Washington, D. C., between the Capitol and the modernized area east of the Treasury, there stands, among many others of musty age, a structure which has been identified with the history of one of the last hundred years' most interesting ventures in philanthropy. Now only the first floor is occupied by a merchant who rents it for a storeroom. The upstairs where once there were busy offices and where many of the most thoughtful persons of the country used to meet and plan with regard to the American Negro problem now contains only unused furniture laden with dust. The building, located at Pennsylvania avenue and 4½ street, N. W., is the old headquarters and still the property of the American Colonization Society, now more than 100 years old, which promoted the movement that brought into existence the Republic of Liberia in Africa.

Virtually all other organizations formed prior to the Civil War to contribute to the solution of the Negro problem have ceased to exist. But the colonization society, which held its first annual meeting in 1816, continues to function, though its operations in recent years have been very limited. And the miniature republic it promoted also survives as among the most novel of the world's governments. It is in a bad way in some respects, however, and is appealing to its "next best friend," the United States, for aid which its representatives say is vitally needed. There now pends in Congress a bill authorizing our government to extend a loan of $5,000,000 to the unique republic in equatorial Africa. The bill passed the House at the last session of Congress and but for adjournment before a vote was taken there, it is probable that the Senate would have given it approval. The measure is sponsored by the present national administration which probably will continue to insist upon its being adopted.

Our African Stepchild

WHATEVER its merits, if adopted the measure will clear up our relations with this country's informally recognized and supported African stepchild. Though for a hundred years the United States has been, unofficially, the protector of Liberia, our government so far has avoided the taking of any step that would make that country officially a dependency of ours. While the proposed Liberian loan measure doesn't so make it, the surveillance it establishes in substance amounts to Liberia becoming temporarily and perhaps permanently an American colony.

In most non-governmental respects Liberia has been an American colony since civilized settlements were established there in the early part of the last century. When the slave trade was prohibited in 1809, the Navy often captured illicit slavers on the high seas. What to do with the pitiful Africans who were rescued became quite a problem. There was no place for them as freemen in America and to return them to their old homes in Africa usually meant a worse fate than the slavery from which they were saved. For as a rule they had been purchased from native chiefs who would have taken them back only for slaughter. So it was arranged to repatriate them to African localities from which they did not originate and where they would have protection. Many were carried to Sierra Leone, where the British had established authority; then, later, arrangements were made whereby they were located in settlements set up in what is now Liberia.

Colonization Urged in 1773

BUT long before that time the colonization of American Negroes in Africa had been urged by many of the ablest students of the then just developing Negro problem in this country. It was first advocated as early as 1773 by Samuel Hopkins but soon gained the support of leading public men, chiefly Virginians like Thomas Jefferson and Marylanders like Charles Carroll. Jefferson believed that it or something like it was the only possible solution of the slavery and race problems.

The movement took on practical form largely because of the agitations of Jehudi Ashmun, who, in 1816, founded the American Colonization Society, with Bushrod Washington as its first president and Henry Clay one of its first vice-presidents. It was followed by the formation of colonization societies in several states, North and South, one of which, the New York Society, still exists, or did a few years ago.

Those organizations were not interested primarily in freeing the American Negro slaves, though Abolitionists gave them support. They dealt chiefly with manumitted slaves and other freedmen whose situation under pre-Civil War conditions often was more distressful than that of the enslaved Negroes. Many wealthy slave owners, mainly in Maryland and Virginia, gave financial and other support to the colonization movement. Agents were sent to North Guinea, where, in exchange for payments made in rum, guns and trinkets, settlement rights on the coast south of Sierra Leone were purchased from native chiefs who ruled over the wild tribes inhabiting the region.

In 1820 the first emigrants were given passage to the Negro haven. All money came from contributions, which never were large. The American promoters of the movement supervised the settlements and aided the settlers who knew many troubles, arising from the climate, the sometimes contentious natives and the lack of facilities for procuring many of the needs their experience in civilization created among them. At first there were numerous settlements distributed widely along the coast. Some of these had identities corresponding to the states from which the settlers had been repatriated. In 1847 they combined into two governments, one taking the name of Liberia, which word was invented in 1824 by Rev. R. R. Gurley, one of the first promoters of the movement, and the other taking the name of Maryland. After a few years of separate operation, the Maryland part became a county in the Liberian establishment and so remains today.

Recognized Along With Hayti

RECOGNITION of Liberia was given quickly by Great Britain, France and other European governments, but, oddly, was withheld by the United States until the Civil War gave a new complexion to the National Government's view of the Negro question. It and Hayti were recognized as independent nations at the same time.

But the subsequent history of Liberia has differed much from that of turbulent Hayti. The African republic has not experienced a single armed revolution. The system of government, patterned after that of the United States, still prevails as first established. Fair educational standards have been maintained. Economically, however, the African venture has met with no notable success. They have developed no industries. The Negroes derived from America live in towns along the coast, the largest, and the capital, being Monrovia, named for James Monroe who was President of the United States when the experiment was begun. The American-Liberians now number between 15,000 and 20,000. The total immigration promoted by the colonization society totals nearly 15,000 for the hundred years of operation. For several years prior to the Civil War it averaged about 500 annually, and right after the Civil War the resources of the society were taxed to handle all who applied for passage. It was able to take care of about 600 a year, though its reports for that period say that a million American Negroes were ready to go to Liberia provided means were furnished. During the last 20 years only a comparatively few immigrants have been handled. There has been some immigration to Liberia from the West Indies and South America. What many regard as the ablest man the republic has produced, Arthur Barclay, who was the country's president in the early years of this century, belonged to the West Indian group. He was a full-blooded Negro, as is President King who visited Washington last year to negotiate the loan now pending. J. J. Roberts, a notable president of the republic, was nearly white. Out of that small civilized group there have come several men who were notable as writers and men of intellect—men like W. E. Blyden, a native West Indian, who, being denied admission to all large American universities, went to Liberia to complete his education and remained there.

Since the Civil War many Liberians have attended colleges and universities in the United States. One, P. G. Wolo, made a good record at Harvard a few years ago. He came from the native population, about 40,000 of whom have become more or less civilized and help those of American source to run the country. About 1,000,000 uncivilized natives of varying racial groups, of which the Kru—noted as seamen—are the leaders, still inhabit the hinterland. Cannibalism is believed to exist among some of the native stock who live chiefly in the forests, of which Liberia has some of the most magnificent in the world.

Natural Resources Undeveloped

THE natural resources of the country are largely unexplored and only slightly developed. The borders of the land are not well defined except on the South and North and this has caused several controversies with Great Britain and France which control adjacent territory.

In all of Liberia's serious difficulties with other countries, the United States has exercised the relation of "next best friend," which was the term used by Secretary of State Bayard in President Cleveland's day in defining our interest in the premises.

The Liberian government's chief difficulties have been of the financial kind. These became critical about 12 years ago when President Roosevelt sent a commission to inquire into conditions there. It recommended that our government send experts to reorganize the government and specialists to help develop the country's industries. It also recommended that we help the Liberians procure a loan with which to put its finances in shape. The loan, about $1,200,000, was made by New York and London bankers and is still outstanding.

The finances are again in bad shape; hence the proposal that the United States Government advance Liberia $5,000,000. It is claimed that this was promised when Liberia, following our entrance into the World War, declared war on Germany. The country took no part in the conflict beyond sending peace delegates to Paris, for whose expenses $26,000 was advanced by the authorities in Washington. A part of the proposed loan will be used to refund the country's present outstanding indebtedness, a large amount of whose interest is now in default.

The loan bill provides for the virtual taking over of the management of Liberian affairs and for their direction through Washington agencies. An American receivership, functioning through a financial commission to be sent from this country, will be established. The commission will have complete supervision of Liberian finances, internal and external. The custom receipts, the country's present chief source of revenues, already are collected by agents representing the United States, France and Great Britain. The proposed financial commission will include a commissioner general of the interior and director general of sanitation.

If the loan bill goes through, very little in the way of important authority will be left to the government of Liberia pending repayment of the loan, which at the best will take many years.

The loan is urged by its advocates, headed by our State Department, largely because of our historic relation to the Liberian experiment—and experiment it still is, according to those who have studied it, despite its century of operation.

Far From Being a Success

ALTHOUGH it is the most successful of governments yet conducted along civilized lines exclusively by Negroes, and is by no means an outright failure, Liberia is far from being the success that its early promoters expected of it. They believed that within a century it would be a highly developed country with a civilized population of millions drawn from the black peoples in America and the native stocks. Its natural resources are immense. From the beginning, white men have been ineligible to citizenship and for officeholding under the Liberian government. This wasn't owing to racial prejudice but only to caution advised by white patrons in America to insure to the Negroes full opportunity to work out their own salvation without undue interference from adventurers. They have had help from sources other than the colonization society, several churches maintaining schools and missionaries.

Underlying the reasons for the new relation the measure now pending in Congress would establish between the United States and Liberia are considerations, which, however, are other than purely sentimental or philanthropic. One, it is charged, is the bankers' loan made the country 12 years ago, now amounting, with accumulated interest, to a claim of about $1,650,000, and in default. The repayment of this to a banking house would be the first slice out of the proposed $5,000,000. The other reasons are world trade and world politics.

Borah Opposes the Loan

IN THE division and distribution of African territory which have been going on since Henry M. Stanley explored what were until recently vast unknown regions of that continent, the United States has taken no hand. American citizens, however, have developed big interests there, chiefly in the Congo. The tremendous undeveloped resources of the continent make Africa an inviting field for big financial and industrial operations. Those carried on by European nationals, particularly the British and French, are expedited by the extended governmental jurisdiction their countries have established. It is natural that Americans with like interests or ambitions in or with regard to Africa should want to see our government gain a lasting foothold there. A hint of these more material considerations is put forth in the document through which the State Department submitted for approval its loan agreement with the Liberian government to Congress. It sets forth that to refuse the loan "would be most lamentable for Liberia; and . . . . it would forfeit to the United States an opportunity which ought not to be held as the chief motive in entering into this enterprise, but which we can very properly consider, an opportunity which confers without prejudice to the interests of the people of Liberia certain natural advantages from the association which the making of this loan would create.

Those "natural advantages" would be perhaps an enduring foothold in one of the richest regions of Africa, meaning very probably the extension of our territories or possessions to that remote part of the world.

In the Senate the proposed loan met with considerable opposition, led in the main by Senator Borah, who caused the measure to be amended so as to appropriate $20,000,000 of government funds for reclamation development in the West. It was largely because of that amendment that the Senate failed to act on the measure before adjournment.

The fight for the loan no doubt will be renewed when Congress reassembles.

No Christmas "Nixies" This Year Is Plea

By THOMAS J. MALONE

GRANDMA EMERSON never received Eileen's Christmas present of last year. At the bottom of her kindly old heart she feared that Eileen had overlooked her, in the confusion of shopping and doing up and addressing and seeing that every one was attended to—purely an accident, of course, Grandma Emerson tried to assure herself. Hence, in her letters to Eileen and to Eileen's mother, whose gift to her had been received, she never even so much as hinted that no package, gay with holiday seals and tinsel, had come to her from Eileen as such packages had come regularly for many Christmases before. How could she?

Now Eileen, despite her harum-scarum 15 years, had not overlooked her grandma. She had actually spent many hours crocheting for her a very smart lace cap and had mailed it to her as much as six days before Christmas in the first armful of packages carried to the drug store housing the branch post office.

It hurt Eileen that Grandma Emerson had not acknowledged her gift, an inattention of which she had never before been guilty. But then, Eileen reasoned, not only was her grandma getting old, she was old, and she must have forgotten to do it and forgotten that she had not done it. Very likely she really thought she had done it. Wherefore, Eileen never referred to it in her own letters—she would not hurt Grandma Emerson's feelings for a thousand Christmas gifts. Eileen's mother approved this course.

So there was the situation: Grandma Emerson in Norwich, Connecticut, 1,600 miles away, feeling a bit neglected and worn-out, even indulging in a little sniffle now and then until her good Yankee judgment came to her rescue; and Eileen Emerson in Minneapolis, 1,600 miles away, wondering why grandma hadn't mentioned that scrumptious cap. What made it worse, if possible, grandma's gift to Eileen, the book that she wanted most, had been received Christmas Eve. Eileen had written her acknowledgment on the great day itself.

What had happened to that cap and to the message of love and cheer that accompanied it? This had happened.

Eileen had put the cap and the message into a small paper box, had wrapped the box in a thin white paper, almost tissue—a regular "holiday" paper—and tied it securely enough. But the paper was too thin to take ink, so she had written the address on a label and pasted the label on the wrapper. The result—tragedy.

For the label, not sufficiently moistened in the hurry of preparing dozens of packages, fell off somewhere in the journey from the post office branch to the outgoing department of the main post office. No one saw it fall. If it was found—in a mail sack, on the floor of a truck or on a sorting table—as was probable, there was no way to connect it with the right one among scores of unaddressed parcels piled up with certain other mail matter, all referred to by post office clerks, mysteriously, as "nixies."

Grandma Emerson's cap had become a nixie.

What's a nixie? The Standard dictionary gives it as the feminine form of "nix," which it defines as "A water-sprite who is able to assume a human form . . . usually malevolent, but capable of being appeased by presents."

Ha! This evil-wishing sprite can be appeased by presents! What more likely than that at the Christmas season, the period when presents are most numerous, the nixies leave the water and roam abroad in the land seeking to be appeased? There would be plenty of reason for flocking to the post offices. Some nixie, perhaps, tried on Grandma Emerson's cap.

Post office clerks as a class, however, take a more practical view of nixies, thinking little if at all of their fairy nature. The name, as most of them understand it, comes from the slang word "nix," meaning "not" or "nothing." To them "nixies" are merely mail matter that for any reason is undeliverable. A piece of mail addressed to a place that is not a post office is a "nixie"; so is a piece addressed to a post office that does not exist in the state or territory given, or that is addressed to some person who has removed and left no forwarding address. Also, any article "found loose in the mails" without destination mark, as a sled that has lost its tag or a locket that has worked its way through the envelope, ceases to be a sled or a locket or a something else and becomes a "nixie."

Nixies, as he knows them, are everyday things in the post office clerk's life. They are always bobbing up, cluttering up the place and giving trouble, week in and week out, all through the year. Never is there a time in a large post office when there is no undeliverable mail on hand. But in the Christmas season, when the fairy nixies can be imagined to leave the water in their zeal to be appeased by presents—when the grand shopping, packing and mailing rush is on and so many people live largely in an atmosphere of panic and delirium—the post office nixies are far more numerous than at ordinary times in virtually every post office in the country.

A post office nixie is due to just one thing, according to the much-enduring post office clerk—carelessness. If you value the gift you are sending, if you want it to reach its destination and please its recipient, why not, he'd like to know, take pains to wrap it securely and give it the correct address, one that won't come off?

Perhaps it should be said right here that the mischievous present-seeking fairies single out and attach themselves only to orphan mail matter, those pieces lacking clearly stated destinations. The other mail they leave strictly alone. It is the mail of the careless folk they are after. There is that relationship between the two kinds of nixies. Parcels without sufficient addresses and without addresses of senders are opened by nixie clerks in a search for clues as to destination or source. Thus the record books disclose the nature of their contents, as well as of articles found loose, and what writing, if any, was found with them. One day's entry in the nixie book in late December may read like this:

> "Hdks (2) Mother from Pearl
> Silver pin—to Emma from Grandma
> Baseball bat Am Boy K553
> Toy T-sets (6) 5 sets White Alco 1 set of blue
> One toy Tinker doll—Beth from Aunt Hettie."

And so on.

The range of Christmas nixies is wide; it is that of Christmas gifts, anything that can be sent by mail. The accompanying photograph of a typical page from a nixie book suggests the variety.

What questions it raises! Did the Cleveland young lady send another photograph, or was she so much put out over the failure of the Minneapolis friend to acknowledge its receipt that she cut him—if it were "him"—off her list and never wrote to him again? What of the boy who still misses the "harmonica" that never came, and so has been unable to invite, or challenge, the neighborhood to "listen to the mocking bird"?

The sample of oats and the padlock keys indicate that not all nixies at Christmas are the gift kind. The world's routine business is going on, too. Items from a page of a nixie book outside the holiday season have little sentimental suggestion. Here are some for July, 1922:

> "Tool, like patent knife sharpener
> Spectacles, 1 pair tortoise shell rims, gold bows
> Needles for machine—1 short, 1 long
> Films, 1 can {6 reels The Devil / 1 reel Spot Cash
> Handle for crosscut saw
> Rubber heels, 1 pair
> Army breeches, size 30 O.D.
> Metal sign 3x5 MN"

The list is prosaic, businesslike.

Some of the mail matter at first classed as undeliverable is eventually delivered or returned to senders; but the ratio of such disposition is low, because clues are generally lacking and people are said to be sadly lax in making inquiries about delayed parcels. If more persons would check with post offices on overdue matter, much of the "undeliverables" would be cleared out.

What, then, actually becomes of the bulk of the nixies?

Perishables are destroyed at local post offices or, if of a kind not offensive or injurious to health, may be distributed to charitable or reformatory institutions.

Other nixie articles are held for one month at the post office where found, then sent to the post office that is the headquarters of the division of the railway mail service in which the source post office is located. There are 15 such divisions in the United States. At the headquarters' office the nixies go into storage for six months, subject to claim. After the six months, they are sold to the general public at auction, the proceeds going to the government.

Sales of Christmas nixies, which take place in the late summer or autumn in all 15 divisions, attract many bidders. Articles to be offered are put on display for several days before the date of the advertised sale so that bidders may look them over in advance and gauge values. Small articles, as toys, are lumped in bags and sold by the bag, while articles of considerable value, like fur coats, rugs, firearms and so on, are sold separately.

A bargain hunter, looking over the accumulation of these articles—on floor, tables, shelves; in boxes, bags, stacks—puts aside his colored glasses. He realizes that the fairy creatures have been unable to take them away or devote them to any uses of their own; that they do not cling to the presents but, being fickle, relinquish or desert them, once appeased.

Small dealers in Christmas notions attend these sales, some coming from outside towns. They are often able to buy for very little last year's Christmas goods and sell them profitably as the new crop.

Grandma Emerson's lace cap may adorn this coming Christmas the equally proud head of some equally dear grandma in Minnesota.

Nixies are a concern of the post office the year round, but they are an especial bother at Christmas. How may they be eliminated, saving the department much work and expense, assuring delivery of every parcel put into the mails this holiday season and obviating the Emerson-Emerson kind of heartaches? Any nixie clerk will give the answer, in about these words:

"It all rests with the sender. Let him give 'character' to his packing, put 'backbone' into it. If your package is worth sending, it is worth good wrapping and packing. Therefore:

"Wrap with tough paper. This paper should be folded, not once only, but several times around contents. If tissue paper is used, it should be inside.

"Tie with stout cord, several strands each way round.

"Write or print a plain address with ink.

"Place return address in upper left corner.

"Attach the address to the article itself inside the wrapper.

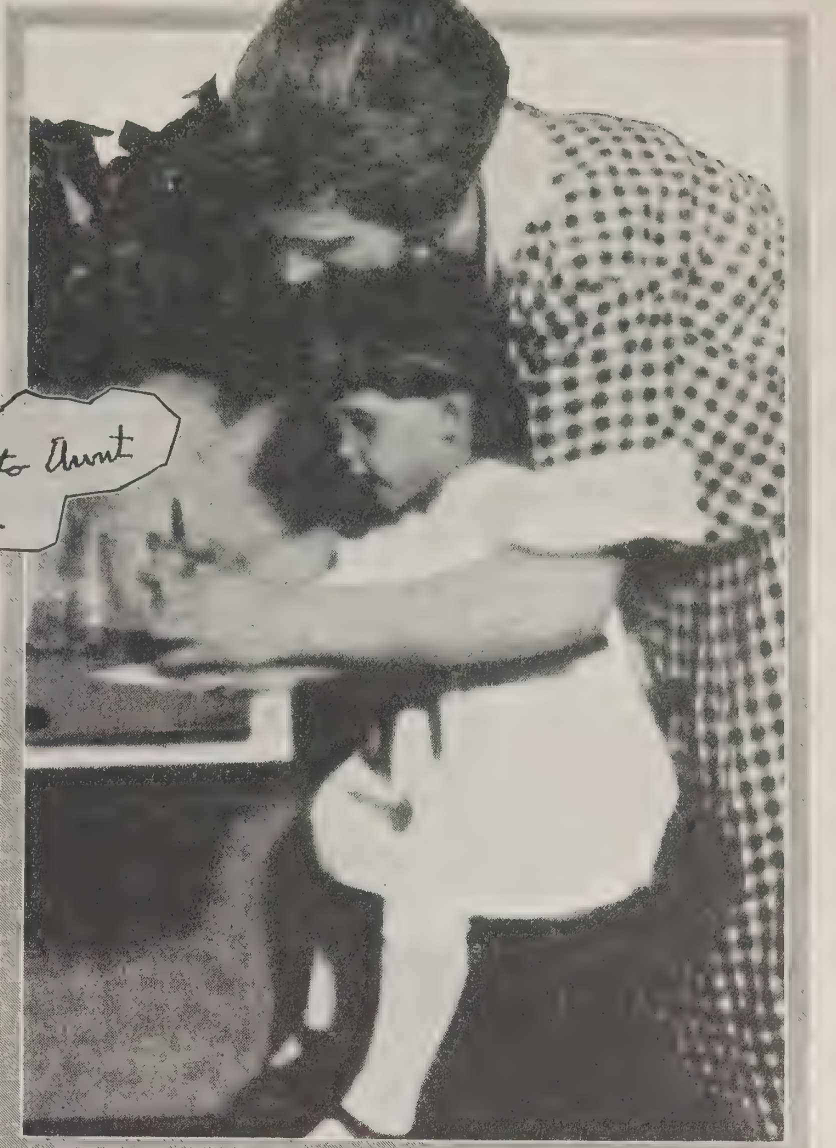
"Inclose articles liable to breakage in corrugated paper or wooden boxes and pack in excelsior or similar substance.

"If contents are perishable or fragile, mark package conspicuously or have mailing clerk do it for you.

"Think of the miles your package must travel, rubbing up against other parcels, handled and rehandled."

These are the instructions for safe and sane mailing issued by the head of all the nixie clerks, Dr. Hubert Work, the Postmaster-General. And to these he adds that, when ready to mail, one should give the parcel the "once over" for address, return address, stamps, wrapping and packing.

That should outwit or discourage any malevolent fairy, however adventurous or avid for presents.



From Dorothy to Aunt Jane

BRIEFLY TOLD

Angora is a city a thousand or more years old. It occupies the site of Greek and Roman towns, whose ruins are met on all sides. The municipal bath which is still in use was built by the ancient Romans.

Large herds of wild caribou swimming the Yukon have interfered with the progress of steamers in that river. Thousands of them are now swarming over the hills through the suburbs of Dawson, Yukon Territory, for a radius of 50 miles from that town. The great herd treks through the district annually on its way northward. Every home in Dawson is provided with fresh meat.

An estimate made in behalf of the Carnegie Endowment for International Peace shows that the cost of the Great War exceeded $335,000,000,000. This amount is equal to the combined wealth of the United States, France and Great Britain when the war began.

Paper pulp, ether, alcohol, oil, tannin, fertilizer and stock food are some of the products made from the southern water hyacinth so much dreaded by the navigator of the bayous and looked upon as a nuisance by irrigation men. This plant chokes the smaller streams of Louisiana, blocking navigation. The enormous volume, rapid growth and cheapness of the raw material will prove a blessing to both the manufacturer and shipping interests.

More than 1,000 miles a month has been the rate of growth of completed Federal-aid roads during the present working season. The mileage completed August 31 totaled 19,308, of which 6,401 miles have been added since the beginning of the year.

The former kaiser's intended marriage has caused him to change his rule of living at the Doorn Castle. Formerly only a few were permitted to visit him, but now he invited, on October 5, 40 persons to take tea with him. To those who accepted the invitation—all people of high standing—he said that from now on he would be glad to see them often, assuring them that he and his future wife would return their visits.

Ex-Premier Clemenceau was at one time a librarian in New York City.

Kuhn, Loeb & Company, of New York, have this year received in gold from Europe, up to October 1, $36,625,000.

China's cotton belt is very wide, extending from 18 degrees to 43 degrees north latitude. Pink bollworm and the club-leaf disease are the principal enemies of cotton in China.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A special residence tax for foreigners has been fixed by the Thuringian government, according to reports from Weimar, Germany. Americans will have to pay from $2 to $50, according to the length of their stay. Residence of more than three days will cost from $2 to $4; for a month, from $4 to $10; for more than six months, from $30 to $50. Other foreigners are to be taxed in proportion.

A honeybee, Achievement Girl, worth $300, is owned by a man in Amenia, North Dakota. She is a prize queen bee, a member of a colony which last summer set one of three world records for honey production. She is being sent to Alabama where she will pass the winter.

"A Soviet messenger, who this week arrived in London to buy books for the Russian government, said that the Soviet government is against the campaign which the Jewish commissariat, or 'Jewseke,' is waging against the Hebrew language and against Jewish erudition in general. But because the Jewish commissaries have set their mind on persecuting all that is Jewish, the government is with them. It is, however, an established fact, that the government has decided to abolish the Jewish commissariat."—New York *Jewish Daily News.*

Water marks are made by the pattern on the wire cloth mold, on which the paper hardens from the pulp.

The Tokyo police have issued deportation orders upon approximately 2,500 Chinese laborers in that city, because they entered Japan with passports issued them as merchants. It is said that they threatened the livelihood of Japanese manufacturers and proved to be "a menace to Japanese labor interests."

Fifteen masked men entered a motion picture building in Leipzig, Germany, and carried off at the point of their revolvers, two reels of the scenario "Todesreigen" (The Dance of the Dead), in which the misery under the Soviet government is depicted.

"Save the boys from the fascination of the military career, if you would save the world from war." This was the substance of an address delivered by Dr. William L. Poteat, president of Wake Forest College, North Carolina, at a national Boy Scout executive conference held recently in the East.

Historic Monticello, the Virginia country place of Thomas Jefferson, is for sale.

"If my colleagues in the United States Senate could have seen me in my kitchen the morning after I was appointed Senator, hunting my old apron to put on before preparing my own breakfast, undoubtedly they would have exclaimed, 'What are we coming to?'" Thus spake Mrs. William H. Felton, first woman member of the Senate in a recent interview. "The call of the age is for partnership in the family, in the church, in state and national affairs, between men and women. It is not myself," she said, speaking of her appointment, "it is the recognition of womanhood and what it will mean to the incoming generations."

The center of Negro population of the United States has moved northeast. It is now located in the extreme northwestern corner of Georgia; approximately 9.94 miles farther east, and 19.4 miles farther north in 1920 than in 1910. Former movements have been southwesterly.

Dr. Adolf Lorenz, the famous orthopedic surgeon, has returned to this country to continue his charity work among cripples and to introduce a new bloodless operation claimed to relieve the sufferings of hitherto hopeless cases.

One hundred and forty newspapers and periodicals went out of existence in Germany during a single month last summer. Among them was the *Tagliche Rundschau,* a Berlin daily founded 40 years ago, which maintained the highest literary standards and had the most cultivated circle of readers of any newspaper in Germany.

Coal is being salvaged from the ocean bottom off the coast near Narragansett Bay. It is believed that between 5,000 and 6,000 tons will be raised to relieve the coal shortage in Newport, Rhode Island. Twelve coal barges have been found, some of them sunk 12 years ago, in water ranging from 100 to 155 feet in depth. A steam lighter equipped with a dredging bucket is the equipment used.

Wall Street Directs Nation-wide Drive in Plot to Cancel Allies' Debt to United States

Country Bankers Too Clever to Be Caught; Start of the Warburg Scheme to "Educate" the People

By CHARLES ALBERT COLLMAN

NEVER before in the history of Manhattan has the out-of-town banker received such a welcome as at the annual convention of the American Bankers' Association, held in New York during the first week in October. From Wall, Broad and William streets, and up Broadway and Fifth Avenue to above Forty-second street, banners greeted him, offering the felicitations of Father Knickerbocker. The event was extraordinary and unprecedented. Entertainments, receptions, dinners, theater parties, sports—everything possible that hospitality suggested was arranged for him.

Wall Street is foresighted. Whenever it wants anything, it spares no pains or efforts to get it. It wanted the country banker, and today it is sending him back home to spread the gospel of its propaganda, for the vast machinery of the American Bankers' Association is probably the most influential body ever organized to mold public opinion in the United States.

The views of financiers on public questions are rarely in accord with public opinion, and with respect to this particular campaign they are exactly contrary to those of the Administration, but the bankers of New York's financial district naturally have their own interests at heart. And the medium they have taken for the purpose of crystallizing banking opinion throughout the country is the convention of their association, held in the metropolis for this purpose for the first time in 18 years.

Eighteen years ago—that is, in 1904—an American bankers' convention was held in New York. *At that time little attention was paid to the men from the interior banks.* Their wives were left sitting in hotel lobbies, ignored at social events and neglected by New York hostesses, while the bankers themselves attended perfunctory meetings in which small attention was paid to what they said. It was a cut-and-dried affair, in which no rare enthusiasm developed, and Father Knickerbocker showed himself an indifferent host, because Wall Street at that time had little use or need for the banker from out-of-town.

But the Bankers' Association meeting of this year was a far different occasion. The country banker has lately become an important factor in the estimation of Wall Street. The financial district made an unusual exertion to impress its guests. As the delegates began to pour into New York, on special trains and chartered steamships, more than 1,200 persons were engaged in registering them, 50 at a time being assigned to meet the onrush of newcomers at the registration desks. The clerks were worn out so quickly that new shifts had to be put on duty every little while.

Wall Street in Lamb's Clothing

ONLY two conventions in the history of the United States surpassed this one in point of numbers. The attendance at the bankers' convention was 3,000 more than was expected, for the total number of persons who registered at headquarters reached 11,503. Out-of-town banker delegates aggregated 3,633, including some women. There were 2,196 women guests from outside the city and 1,502 men guests. The record attendance at previous conventions of the association had been 4,600.

Smokers, fashion shows, dinners, sight-seeing excursions by motor and boat were arranged. Social affairs were organized to pay special attention to the wives and daughters of the delegates. Wall Street feasted its guests, toasted, flattered and cajoled them. A partner of the leading banking house tried to persuade the astonished delegates that New York was "just like their own cities, except for size, and that Broadway was just another Main Street," and he begged them not to give way to sectional feeling against New York.

In fact, the financial district showed its best front. But this about-face where country banks were concerned was adopted for a reason, since Wall Street invariably acts with a purpose in view. It had an ax to grind, and having in mind a country-wide campaign, it needed the help of the thousands of bankers who had come from every part of the Union.

A fight by independent bankers against the branch banking system was one of the big issues at the convention, and the agitation over this question was one of the reasons for the record-breaking attendance. Although a large majority of the out-of-town bankers, who make up most of the membership of the organization, are against the branch system, a bitter minority, aligned with the great financial institutions of Wall Street, was prepared to favor the branch system and oppose the convention taking any action against it.

Representatives of some of the big banking institutions made advances looking toward a compromise, which would have put the convention on record as merely opposing a further extension of the system, and recognizing the right of national banks to establish branches in states which have passed laws permitting state banks to have branches.

Leaders of the independents rejected the compromise plan. Their stand was supported by a mass meeting held the day before the convention, at which resolutions were passed and speeches made denouncing the branch banks as an un-American attempt to monopolize the money power of the country in the hands of a few centralized interests.

One of the speakers compared the traditional American banking system, consisting of many independent banks, with the Continental idea of a few banks with branches and one great institution acting as the fiscal agent of the government, and with the Canadian and Scotch branch bank systems. "The branch bank system of expansion," he argued, "is a centralization of money power in a few hands; the American system is one of decentralization of money power, but with organization and mobilization of reserve available to all. Theirs is a system of centralization, ours is a method of co-operation. The one is a domination of money power by a few, the other an organization of the resources of the many, uniting all independent banks into one cohesive whole."

This Canadian illustration was given:

"Nothing illustrates this better than the retarded growth of the western cities and cities in the maritime provinces of Canada. Her natural riches are extensive. She has a great and resourceful people. And yet most of her cities and towns are farming and fishing centers. There is a noticeable lack of factories and other industrial enterprises outside of her few banking centers. The financial resources of her outlying districts, cities and villages are tapped and brought to a central reservoir, with the result that the cities of Montreal and Toronto profit at their expense.

Country Bankers Win First Round

THE speaker then made this important statement concerning our own country:

"The control of great financial resources in a few banks, with their associated insurance companies, trust companies, securities and investment companies, even today means control of railroads, mines, steel mills and other industries. **Furthermore, in a democracy money power always has and will carry with it corresponding political power, which is reflected in legislation, executive acts and frequently even in judicial circles. ALREADY 46 PER CENT OF THE NATION'S MONEY AND CREDITS IS IN THE HANDS OF ONE PER CENT OF THE BANKS."**

The fight, in effect, was declared to be one of *city against country,* of a "chain-store" bank system against the individual small-town bank. A summary of the arguments against branch banking included the following:

"Shall 10 per cent of bankers force branch banking upon 90 per cent?"

"Branch banking would make a tool of the Federal Reserve System."

"The Controller of the Currency deplores branch banking—but aids it greatly."

"The past of branch banking is monopolistic—can its future be different?"

New York interests were somewhat staggered by the general attitude of hostility against branch banking. Although several prominent financiers spoke in favor of the idea, yet, finally, in general session, the convention adopted a resolution against the system:

> "Resolved, by the American Bankers' Association, That we view with alarm the establishment of branch banking in the United States and the attempt to permit and legalize branch banking; that we hereby express our disapproval of and opposition to branch banking in any form by state or national banks in our nation.
>
> "Resolved, That we regard branch banking or the establishment of additional offices by banks *as detrimental to the best interests of the people of the United States.* Branch banking is contrary to public policy, violates the basic principles of our government and concentrates the credits of the nation and the power of money in the hands of a few."

The vote of the convention, taken by acclamation, was overwhelmingly against branch banking. The delegates from the small-town banks, who had swarmed to the convention from all parts of the country, many of them for no other reason than to fight the encroachment of the powerful banks and their branches upon their own little institutions, applauded and cheered their victory.

The opposition of Wall Street had been much less than had been expected.

The out-of-town bankers were enthusiastic over their supposed triumph. Whatever views the financial powers have regarding branch banking, they relegated them to the background for the time. They permitted their guests to score an easy victory, for they had in mind the solution of a problem of more immediate importance to themselves. *Wall Street financiers are anxious to cancel the Allies' debts, and the real purpose of the meeting was to induce the assembled bankers to exert their country-wide influence in helping to shape public opinion to that end.*

Roughly totaled, the Allied indebtedness to the United States aggregates $11,000,000.000. The greater part of this huge sum was not actually handed over to the foreign governments. It was deposited to their credit in the large financial institutions of Wall Street to pay for war material, railway equipment, foodstuffs and supplies that were sent abroad. Eminent banking houses, which had become the purchasing agents for foreign governments, placed the contracts for the manufacture or purchase of such goods and materials. They had full control of the disposal of the billions raised by the sale to the public of government bonds. The contracts were placed in munition plants, steel mills, railway equipment and other industrial corporations organized and controlled by financiers. *It is through these funds that the wealth of Wall Street has been quintupled since the war.*

Within the last few years the financial district has adventured into an untried field. Its international banking houses have established branches in the countries of Europe and Asia, where they have engaged in the business of making foreign loans, even to the as yet unstable governments of newly created nationalities. Whether this speculative enterprise is for good or ill remains to be proved. *Wall Street is exacting a huge tribute from these distressed countries. Its profits are immediate and enormous. Only the contractual parties can tell what banking commissions are being paid.*

These risky Czecho-Slovak and other foreign bonds are listed in large amounts on the New York Stock Exchange. *Generally they pay from seven to eight per cent. Wall Street is not a bond buyer, but a bond seller. The investment public takes the risk.* However, should the Allied governments be called upon to pay their obligations to us, most of them would be unable to borrow money through foreign loans. *Wall Street would lose this profitable business.*

But those eleven billion dollars must be paid. That debt is represented by outstanding obligations of the United States Government. If they are not paid by our foreign debtors, they will be paid by the American people through the continuance of high taxation and heightened cost of products. The international bankers are content to see this done. This in a nutshell explains their attitude.

"Big Guns" to Stampede Them

THE two chief speakers at the American Bankers' Association convention were Thomas W. Lamont, of the firm of J. P. Morgan & Company, and Reginald McKenna, former Chancellor of the British Exchequer and now Chairman of the London Joint City and Midland Bank. The powerful publicity batteries of the A. B. A. devoted their entire ammunition to what these two men said, and both of them spoke almost exclusively on the duty of the American public to cancel the Allies' debts.

Mr. Lamont, in his opening address to the bankers, said:

"Emphatically, let us figure to see whether the payment of these debts (which inevitably must mean a great increase in our import and a heavy decrease in our export trade) is going to prove an asset or a liability for American business."

Mr. McKenna's address was referred to by the bankers' publicity men as the "big" speech of the convention. The English banker, himself a representative of one of the debtor nations, warned the American bankers that an attempt to enforce the payment of the war debt beyond the ability of the debtor nations to pay would result in serious consequences for the United States as well as the countries of Europe. There would be an inevitable injury to the international trade of the world, reduced profits, lower wages, unemployment, lower standards of living.

Steps were at once taken by the convention to influence Washington opinion through the expressions of the two bankers. The response was immediate and unsatisfactory to the convention. Administration leaders expressed dissatisfaction over the political situation in Continental Europe. Certain European governments, they said, which are heavily in debt to the United States, were maintaining large military establishments, keeping themselves actually on a war footing, and making no real effort to reduce expenditures in attempts to balance their budgets and otherwise seeking to put themselves in a position to meet their obligations. They held that the United States would be derelict in its duty, not only to its own people but toward civilization, in permitting debtor nations to maintain extravagant military establishments on borrowed American money.

Since then, other spokesmen for the Administration, notably Herbert Hoover, Secretary of Commerce and a member of the Allied Debt Commission, have declared that Europe can pay and should do so.

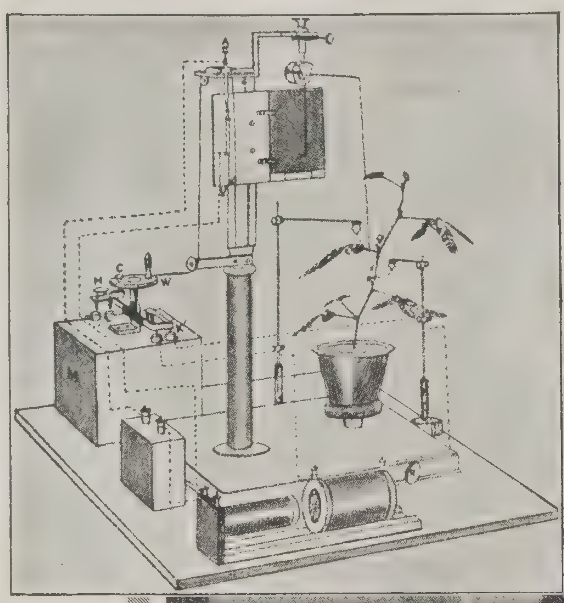
At the close of the convention, it was announced officially that "the bankers are now ready to guide the public." It will be useful and instructive for the country to observe closely the conduct of the proposed campaign of propaganda by the American Bankers' Association in educating the public mind.

Talking Turnips and Dancing Doornails

Noted Hindu Scientist, Knight and Companion of Indian Empire, Finds That Vegetables Can and Do Curse Right Heartily

Fairyland Created by Sir Jagadish Chandra Bose in His Laboratory at Calcutta Reveals Amazing Wonders

By GOBIND BEHARI LAL



At left—This is the machine that enables plants to write. Doctor Bose's Resonant Recorder.

Below—Doctor Sir Jagadish Chandra Bose, F. S. R., leader of India's Scientific Renaissance, lecturing on his discoveries before the Royal Institution, London.

HOW often have you said, with an air of finality, "as dead as a doornail?" How often have you described an unusually silent acquaintance as being "as dumb as a vegetable?"

Well, you were wrong. Metals are not dead. Vegetables have speech, feelings, even temperament. Carrots can swear in anger, and purr with pleasure, and visibly register both reactions; potatoes or turnips can get drunk, and suffer headache and remorse. A tin pan can expand, and, in its own way, sing with joy: a doornail can, under provocation, shimmy like a flapper; "money talks," and it also grows weary, and dies—money minted from copper, silver, gold.

A world-famous scientist reveals these wonders. He is a Hindu, Sir Jagadish Chandra Bose.

In his laboratory in Calcutta, near where the palm-parasoled Ganges River is caught in embrace by the blue-robed Bengal Bay, the lay visitor finds himself in a new fairyland. He sees vegetables, trees, shrubs, metals, behaving like cats, dogs or men.

To make sure that this is so, numerous rigid scientific tests are applied, a few of which, shorn of technicalities, are presented here:

Fill the glass-chamber, in which, during the term of the experiment, the plant is housed, with the vapor of alcohol. After some pause, the plant conducts itself thus. First, it leaps with delirious hilarity; then, it jogs onward with a funny, wobbly gait, like that of a soused sailor; at last, it slumps down, registering the depressive reaction, the morning-after feeling, headache and remorse. The plant keeps a daily cycle of sleep. But, more after the manner of a fashionable man given to the nightly gayeties of a city, than of an early-rising country squire. The plant Mimosa, the sleep-habits of which Doctor Bose especially probed, keeps very late hours. Not till well past midnight does it retire. The dawn, when she alights from her starry boudoir, finds our plant, and leaves it, profoundly asleep. Morning is indeed far advanced before the plant very slowly arises. At noon, finally, it is fully awake and astir.

In temperament, a plant varies according to whether it is stout or thin. If stout, it responds, as to the provocation of a blow struck, or some acid spit at it, in a leisurely, trailing way. If thin, it comes back forthright, abruptly, hysterically, and soon outpours its pep.

A plant was brought up in a little palace of glass. It was nourished with all care. From the vulgar touch of dust and buffets of wind it was completely shielded. On coming of age, so to say, it appeared prosperous, sleek, irreproachably groomed. But when it was tested as to efficiency, with Dr. Bose's uncannily subtle instruments, this plant turned out to be a sluggardly moron, a lazy idiot. It was smitten with blows. And that changed its character considerably. It stiffened up all round, became alert and snappy in responses. Hard knocks, forsooth, do a tree a deal of good.

The rose vine's life is by no means all a couch of roses. The living days of a plant have many shadows—depressive moods, ailments, and not infrequently, capital tragedies—hovering over them.

Whenever a cloud in the sky muffles out sunshine from it, that tree, from out there in Doctor Bose's laboratory-campus, sends in radio signals indicating "low spirits."

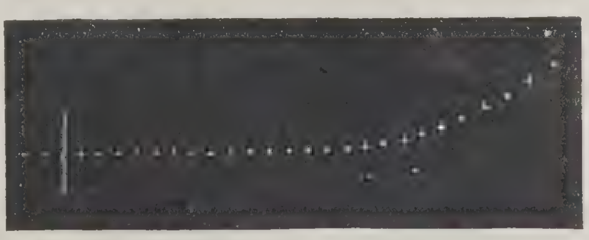
Inside the laboratory, the plant often gets a spell of "blues," because of the incessant questions of its scientific interviewers, or persecutors. To one or two, or even ten, questions, the plant replies with pleasure. But when they put to it the same query over and over again, why, of course, the plant is bored to annihilation. To use Doctor Bose's own words: "When excessively tired, it temporarily loses all power of perception; in this condition, the plant requires at least half an hour's absolute rest to regain its equanimity."

The leaf-stalk of a plant being chilled with ice becomes utterly numb. It remains frozen after the ice is removed. In fact, it is paralyzed. When, however, a series of electrical shocks, not too violent, is administered, it recovers.

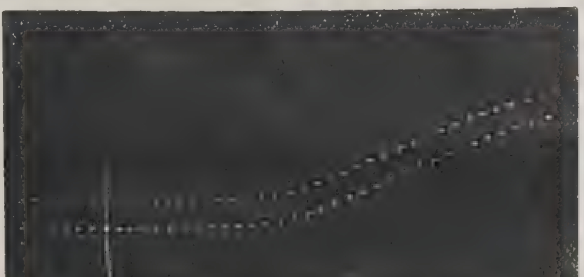
How even trifling indiscretions with heat and cold, water, soil and fertilizer, upset the plant, retarding its growth, is revealed with astonishing accuracy and frankness by one of Doctor Bose's instruments, the Crescograph. Ever so many things, indeed, disturb the plant's liver, even though it has no liver.

Carbonic acid gas, the foul air men and burning candles exhale, is pernicious for the plant. The notion that it is not is wholly erroneous. It suffocates the plant, as it suffocates man. And when into its chamber, smudged with carbonic acid gas, is pumped some fresh air, oxygen, the delighted plant gasps with relief and brightens up. As for ozone, double-oxygen, formed in the atmosphere after a thunderstorm, it has the same exhilarating effect upon a tree as upon a human being.

Oh, but to think of mown hay being in agony. Of course, there is this consolation: that we are in an age of painless surgery. And Doctor Bose's experiments have shown that ether and chloroform deaden sensibility in plant tissue as in animal.



A normal response to stimulus, a regular answer to an honest question, in plant's own handwriting.



Same question asked twice, same answer returned twice: *question*, the verticle white stick; *answer*, the dotted lines.

Downright calamities come to the plant from these pungent chemicals that bear coils and coils of ungodly names . . . . *sulphureted hydrogen, potassium cyanide* and the rest. They are poisons. They kill the plant.

A plant is in the throes of death. Each stage of the crisis is clear. The plant's curve of response suddenly heaves up, as though it is singing its swan-song at the top of its bursting lungs. Then, sharply, its movement is reversed; it falls, so to say, face-forward. Its thrills of pleasure and pain; its moods, gay and sad; its touchiness, obvious even to the naked human eye if the plant is Mimosa; its rhythmic pulsation, like heartbeats, plainly visible in the leaves of the Telegraph-plant, a native of Bengal; its nervous clutch and closure if the tree is Dionoea, the leaves of which close upon and crush to death any fly that might sit on them; in short, all its ordinary and extraordinary sensibility or power to respond has gone forever: the plant is dead.

In Doctor Bose's laboratory, Mr. Tin and Mr. Iron and Miss Platinum, Madam Silver and Master Gold also comport themselves like animals. They respond to stimuli as do living things. And their responses vary, like those of animals and plants, according to whether they are weary, depressed, poisoned, paralyzed, or, on the contrary, exhilarated.

It would be wrong to think that Mr. Tin is not subject to moods. At times, Tin answers not a question; the question being, of course, a stimulus of some sort, a faint blow or a touch of some drug or a shock of electricity. Is it paralyzed? Dead? Put the question, exactly the same question, again. And again and again. Suddenly, Tin shoots back an answer. The last question gets Tin's goat. Now, note: the answer Tin gives is not simply to the last question. It is not a one-step answer to a one-step provocation; it is rather a long-drawn affair, a whole series of steps, a full staircase: Tin responds to all questions at once.

And to metals also comes the moment of the great departure. Some treacherous poison, perhaps, has brought on the crisis of death, that is seen to be exactly similar to the death-crisis in plants and animals.

Simple in principle, but exceedingly difficult to make, because of their extreme delicacy, are these instruments of Doctor Bose.

Take these two: one that is especially useful for eliciting confessions from vegetables; the other that enables plants to write.

Number one: It is a highly sensitive galvanometer or electrical dial. Its ends are pushed into the sides of, say, a carrot. Impulses from the body of the excited vegetable, excited as when pinched hard, pass to the instrument's indicator, setting it in motion. To the indicator is attached a tiny mirror that reflects a pencil of light. With every impulsive quiver of the mirror, the pencil of light makes shimmering, luminous figures that can be caught on a screen and photographed. Each of these figures has a definite meaning. It is a code of light-signals, remarkably trustworthy. You simply can't fool the carrot.

Number two: The apparatus is the recorder, the resonant recorder. It is a sort of combined pen and tablet. The pen is not a pen, but a needle. For the tablet, there is a glass-plate coated with smoke. The needle's tip touches the plate's dark surface. The stem of the plant, under examination, is connected to the recorder's needle by a fine silk filament. When the plant reacts, its impulses, passing through its silken arm-and-hand, move the needle to and fro, at the same time that the plate slides downward, at a set speed. Thus, the writing-needle's sharp fingernail scratches off the plate's smoky rouge in a calculated manner. Each scratch, be it arc or dot or dash, represents invariably the same thing: this is indeed a true stenographic script, marvelously certain.

Doctor Bose has pulled down with scientific blows the partition that has so long divided the animal and the plant, and the living and the non-living generally.

Vital Force, Life Force, has disappeared from the stage of modern science. The power that enables a man to yell is not essentially different from, and more mysterious than, the power that appears as heat, light, electricity or magnetism. Frederick Soddy, the great authority on radium, says:

"Energy, like money, has many denominations, but these are honored at fixed exchange ratios throughout the universe, whether in the living organism or in the non-living world. The power by which we live and move and have our being is none other than that which drives on the stars in their courses and maintains their splendors over the long epochs of cosmical time."

Ultra-modern as it sounds, the idea of the kinship of all nature has a past.

More than 60 years have passed since Darwin stirred the world by his idea of evolution; of a common and continuous origin of all living beings, plant and animal and man.

But a whole generation before Darwin, an English poet, Shelley, had sung that everything, from stone and herb to man, was infused with one and the same plastic force. "The one remains, the many change and

Drifting—Whither?

THE situation in the Near East is not proving so amenable to reason as some of the world politicians recently assured us it would. Agreements reached one day have become the center of disagreements immediately succeeding, and preparations for violence balked one day have shown surprising progress on the next. The whole matter is so complex that nothing but the plain truth could render it simple, and that truth is not likely to percolate as far as the people. The world is too much taken up with New Jersey murder cases and local aldermanic squabbles to pay much heed to the mutterings of a coming world war, as these mutterings roll up, mixed with strange names, and involving strange geography, from the Near East.

This running sore is kept open by constant irritation from several sources. The Palestine policy has its part in it, because of the agitation which has spread throughout the Arab world, and thence throughout the Mohammedan world, by reason of the sudden and drastic Judaization of Palestine in direct violation of every written agreement made with the Arabic peoples during Allenby's Palestine campaign. The war ejected the Turks, the Balfour policy has practically ejected the Arabic peoples whose home Palestine has been for 2,000 years, so that this narrow strip of land is really the center of the storm, though as yet the storm has only touched its borders.

To this must be added the trouble which British Administration is enduring in India—and which it is causing, too, as facts require us to add. New cause has been given to the rising unrest of India through the British authorities' resort to violence in an attempt to break up the natives' temperance campaign. As is well known, the Mohammedan eschews alcohol. In the Punjab a part of the administrative revenues come from liquor taxes. The natives, in concern for their brothers who have fallen into the white man's drinking habit, as well, no doubt, in desire to affect the government revenues, have stationed men at the doors of the drink shops to plead with Mohammedan customers to respect their religion and refrain from patronizing the places. This, on every count, the natives have a perfect right to do. But the British officials have seen fit to meet them with a violence which ought to rouse extreme moral indignation in the British homelands. The news of this treatment circulating through Islam, together with the other elements of vital interest to the Islamic peoples, is creating a solidarity among them that has never been approached in their history. No one can view it without seeing into what catastrophic possibilities it may yet head up.

It is profitable to reflect that liquor, the cause of so much difficulty at home, is now being transplanted to create trouble abroad. The sudden appearance of the discarded American bar everywhere in Palestine, upon the operation of the British mandate, made a wound which cannot easily be healed.

On the other hand are the formerly latent and now active jealousies between the French and British statesmen, egged on by their men of money. The friendship between France and Britain has been a thing of necessity, which the Armistice soon stripped of any temporary generous elements it may have possessed. England has been casting a weather eye toward France for several centuries, because France has been thinking thoughts of conquest toward England, and there is more than sufficient data to prove that a military alliance against Germany is quite distinct from a natural friendship. France has more of an affinity toward the colored races than has Britain, and it was something more than politics and policy, it was something akin to sympathy, that ranged France with Turkey when at the Strait the Mohammedan world in Kemal Pasha faced the Western world in General Harington, and stopped just short of drawing the sword.

There are agents of destiny, though moved by motives of immediacy, behind the whole disturbance. Moneyed men glide in and out, one man of fabulous wealth even the name of whom the world had never heard until six weeks or two months ago. For purposes of their own these men are playing their part in the arrangement of the chessboard upon which the world is yet to play another mammoth game of destiny. And as yet, there is not a single power which can reach out and check one of those men, there is not a single power that is brave enough to challenge the whole preposterous disposition of the world which was made at Versailles—and so the situation just helplessly drifts.

It would be an excellent thing if the intelligent people of the United States would withdraw their breathless attention from New Jersey murder cases for a time, and try to understand what is transpiring with regard to the peace of the world.

The First Note of Christmas

"To The Editor:

"As a regular reader of The Dearborn Independent, and one who appreciates its progressive policy and influence, I am writing to express the hope that, as the Christmas holidays draw near, The Dearborn Independent will say a few words in its editorial columns regarding the preservation of our beautiful native holly.

"The advent of the automobile has made even the most remote woods and swamps accessible, and since the holly tree cannot flee and hide itself, as do the wild birds and animals, its utter extermination is only a matter of a few years unless our people can be aroused in time to save it.

"The cutting down of whole trees, leaving the useless stumps to rot, in order lavishly to decorate department stores, club rooms, and other large buildings where potted plants or artificial decorations would serve the purpose, is indefensible.

"Rich in legend and history, and symbolical of our Yuletide happiness, the holly tree holds a secure place in the affections of the American people, and its preservation seems to be a patriotic duty."

This seems to be a plea that cannot easily be disregarded. What would Christmas be without holly? And if the ruthless destruction of the Christmas symbol is going forward, as our correspondent says it is, it is time for Christmas folk in the holly-producing regions to do their duty by the rest of us.

Truck vs. Rail Transportation

RAILWAY AGE sees such a loss in railway freight shipments as seriously to affect railroad revenues, due to the rapid completion of hard-surface highways and public encouragement of cartage by motor. And in so saying, *Railway Age* doubtless voices the fears of railway management generally.

Steam roads had already lost much of the traffic available for truck transport, such as light package and short haul freight, to the electric lines; and it would seem that now the latter are in greater danger from the new competition.

If competition shall injuriously affect the rails, it will be much on the order of compensation inevitable in human affairs. Had steam lines always been conducted on business principles, had they not been burdened with stock-jobbing operations by the parasitic class, they could have forestalled such competition as they now fear. Had the freight business been carried on as John Jones must carry on his cartage business, neither trolley nor auto truck could be the menace both are now. A locomotive can haul freight for less money than can either of its competitors; but when it must earn profits on wind and water, the handicap is too great within the limitations of the operation.

Both trolley and auto truck have one advantage in the closer delivery to the consignee, which would offset the lower cost of steam rail service to some extent; but it is safe to say that the railways, had they been content with a modest return for the service, might have avoided the competition to a large degree. At any rate they must meet it now.

How U. S. Could Escape Interest

A READER of our editorial, "Watch the Interest Grow!" in the issue of October 28, writes to ask "how a loan could be negotiated by the Government to avoid the Interest." Interest, as The Dearborn Independent has pointed out, is the great burden from which the country is suffering.

Let it be understood first that every dollar in our currency system is a dollar because Government makes it so. Issued under the various authorizing statutes by banks, it is guaranteed by Government, which accepts as security for its endorsement the deposit of certain securities, including some classes of commercial paper.

The liberation of the Government from the Interest burden can be effected only by the Government issue of the currency itself, or in providing means whereby currency may be issued without cost to the people. Interest is a burden upon Government because Government has transferred its constitutional monetary functions to private groups of financiers.

There are two direct issues of paper money by Government each of which is a natural obligation. The first is the Treasury note, redeemable on demand and made a legal tender for all debts, public or private, which maintained its parity with coin from the start. These notes, or their reissue, have never been retired.

The second is the United States note, or greenback, which was not a full legal tender at first, but was given that quality by law in 1879, since when it has been as good as gold, and is in almost every citizen's pocket.

These two elements of our currency represent a portion of the Government debt *upon which no interest has been paid, and which is still serving as money, sixty years after it was issued.*

Of the remainder of the public debt, the National Bank notes, secured by Government bonds, bear the lowest rate of interest of any issue which Government has made, yet every bond markets above par. If you compare the rate, two per cent, of which one-half per cent is rebated as a circulation tax, with the four and one-quarter per cent bonds just reissued to refund some of the war obligations, which fluctuate with the market, it becomes clear that our Government has not only the method but the constitutional basis for avoiding the fatal drain of interest.

The only bonds bearing what is termed the circulation privilege—that is, the only securities upon which a bank is entitled to issue currency—are, in the case of National Banks, the consols maturing in 1930, and in the case of Federal Reserve and Federal Reserve bank notes certain other securities, most of the $23,000,000,000 of the national debt not being available for the purpose. The statute providing for the issue of Liberty bonds, the bulk of the big debt, specifically denies them the circulation privilege.

If, instead of the delegation of the power of currency issue to a banking monopoly, the Government would confer on every bond outstanding the circulation privilege, and extend that privilege to every incorporated bank in the land, thus quadrupling the number of banks of issue, and suspend the interest during the time the bonds remain in the Treasury as security for circulation, the billion dollars in interest now paid annually would in large part be saved.

The correspondent must realize that Government is not borrowing money, but credit, which has supplanted money; that the Government itself provides the credit and then pays for the privilege; that since the whole fiscal system is sustained by Government's power to collect taxes, upon its ability to produce wealth, there is no reason why it should pay interest.

This argument is in lieu of that really better, but not so popular, argument, that a direct issue of currency by Government would meet all demands.

How Tariff Cuts Both Ways

THE heading of a trade report published last February furnishes an object lesson to farmers which should be most carefully studied. In the midst of the emergency tariff régime, in which farm produce was "protected" by heavy duties, in contrast with their place on the free list under the Underwood Act, prices of grain had dropped more than half!

The title referred to reads, "Imports Lowest in Years," and refers to the foreign trade of 1921. That there is a close connection between the market for our grain surplus and the demand in this country for commodities originating abroad will not be denied by any economist, whether a protectionist or free trader, but it must devolve upon the individual to decide whether the natural law of barter and exchange shall operate or restrictions prevail, and whether such restrictions are of advantage or disadvantage to his own welfare.

Business will adjust itself to any conditions imposed on trade, but in that adjustment it will be found that no exclusive advantage to one class can be attained without disadvantage to another. There must be a reciprocity in barter and exchange.

Mr. Ford's Page

WHAT we call ethics in business is only the basic adjustment to the laws of business; it is not something deliberately imported from outside for the sake of making better something which is naturally bad. Business is naturally good, must be in order to continue, and the chief difficulty with it is that something from outside has been imported into it, disease germs are invading it, wholesale upheaval threatens it.

Most business men regard ethics as a refinement, a sort of moral manicure, a nice ornamental attachment which business can afford after it has become sufficiently prosperous to stand it. Ethics are esteemed as a sort of generous gesture toward the squeamishness of a world that is not yet entirely hard-boiled—"We'll have a department of ethics, just as we have a department of store-dressing or shop welfare!"

As a matter of fact, most people regard ethics as something lugged in on the strength of authority, as a code which religion imposes, as a troublesome system by which the weak are not required to struggle against the strong—or, worse than that, as a system by which the strong are to curb their aggressiveness to the limitations of the weak. They imagine that "right" and "wrong" are the standards of women at home, of the weak, of a religious system that is looking out for the riffraff of humanity—that they are the rules of a pleasant game and not the laws of a burly life.

Of course, the view of ethics as the voice of a supreme authority, as the legislation of religion or as the self-protective system of tender consciences, has been exceedingly useful, and still is. The history of moral improvement has always been that men have *felt* a thing to be wrong before they have *known* it to be wrong, and they have *known* it to be wrong before they have known *why* it is wrong. That is the method by which new visions of right and wrong have come. Beginning far up in the luminous mists of the moral consciousness, they have finally become the hard matter-of-fact practices of an efficient economy. The first outcry against slavery was the outcry of the religious mind, which had little of the *why* or *wherefore* about it; but presently politics and sociology and finance came along, and what was first the vision of moral faith became at last the economy of common practice. It was the same with Prohibition; it began with women and "cranks"—it was a moral wail in the wilderness; now it is the practice of every department of activity that once was ranged against it. Why? Because it came to be seen, not as an artificial standard of goodness imposed from the outside, but an inherent and neglected part of the fundamental law of effective living.

We talk a good deal about "the faith of our fathers," but a large part of our fathers' faith has ceased to be faith—it has become knowledge. It is the function of faith to descend out of the mists of *believing* and establish itself on the concrete plane of *knowing*. We shall be as good as our fathers were, not by imitating the subjects of their faith (most of which subjects are matters of faith no longer, but matters of knowledge) but by keeping a wide sky-space above for our own faith to brood and form, that in time our faith too may become the treasures of sound knowledge for our children.

Business ethics was one of the elements in our fathers' faith. They were honest because they felt it was the honest thing to be honest. They did not overreach, because they felt that it was contrary to some delicate code to do so. They built their businesses soundly because they had a pride in their names and they had a personal desire to hand down the name not only untarnished, but respected, to their sons. A man's name was his principal asset: we had not then reached the practice of using trade names to conceal personal connections. There was a certain intangible quality of tremendous dignity which was called "honor" and in American society it counted above everything else. The best men could afford to be poor, but not dishonorable.

Now, of course, the situation is different. Business is no longer exclusively in the control of the class just described. We have witnessed a complete change in business, some of it for the better. Business as a *means* and not as an *end,* represents the greatest change. And the difference between goodness and badness is found in answering the question, "a means to what?" With too many, business is regarded as a means to a quick fortune and an early retirement. There are fortunes in the public; business is a means of milking the public; speed up the milking!—and then leave the ruins and the recrimination to those who follow. The reputations of whole sections of business have been ruined by this method. Some lines of business have become a byword for crookedness. We have an increasing number of clever men who enter business after business, not for any love for any business, but because they have heard "there is money in it." And what they leave behind them is wreckage. Curiously enough, they themselves continue on their way apparently unscathed. This will always be the case where a certain alien type of mind is permitted to do business. A man, who builds a house to "sell" and not to live in and therefore builds it of inferior material and workmanship, is exactly like the man who enters business for what he can get out of it and not because he is seeking a place where he can do the best that is in him. Jerry-built houses and jerry-built businesses are alike. They are profitable immediately and unprofitable forever. They are bombs leveled at the soundness of the economic order. The true "Reds," those who have real power to work damage, are men who are defying every principle of plain honesty in their business. They are literally knocking the props from under society. The anarchist never has been able to achieve any harm, comparatively speaking; society is being constantly weakened by its own reckless disregard of primitive honesty.

It is not a question of ethics; it is a question of natural law. An ethical question may be involved in putting a hundred-pound weight on a timber that will only support fifty pounds, but there is first involved the law of strains. Ethically, it would be wrong to sell such construction to families, where women and children would be under the menace of death or maiming every moment; but, practically, how can any business of building be constructed by following such methods? In time the people would distrust houses and go back to caves. The business would kill itself. But on the quick dash of building and selling, fortunes could be made under even a bad method, and the immediate profit will always blind a certain type of mind to the future welfare of the business. That type of mind must get out of business. Good business men must drive it out. They must drive it out of themselves first.

In other times, people trusted business men as to quality and prices and terms. As this trust grew, the people themselves became less capable of judging. And as the people grew less capable of judging, the temptation to cheat them became greater. The buying public needs to be educated by the good business man. People need to be educated how to disregard the price tag and judge the quality. Merchants of substantial material are constantly being shoved to the wall because an ignorant buying public is attracted by the flashy show windows of other stores which appear to offer "the same thing" at a lower price. Of course, the customer is stung; but the shoddy merchant gets the profit, and while the public is learning, many a good merchant suffers. Educating the public as to qualities and values, ostracizing the quack business man just as we have ostracized the quack doctor and the shyster lawyer, will set business back in its proper circle of service and success and confidence.

> *THE first element of business efficiency is what used to be called Business Ethics, but which may be better described as the fundamental adjustments of business to natural law. There is a law by which things go ahead, and a law by which things go to pieces. This used to be only a faith with most of us, it seemed to have its sanction from above; now it is knowledge with many of us and is seen to have its foundations from beneath. Unless faith is always becoming knowledge, there will not be room for new faiths. Ethics in business is no longer sanctioned only by the "Ought" of good will, but by the "Must" of the Law. We not only Feel but we Know, and what is better, we Know Why.*

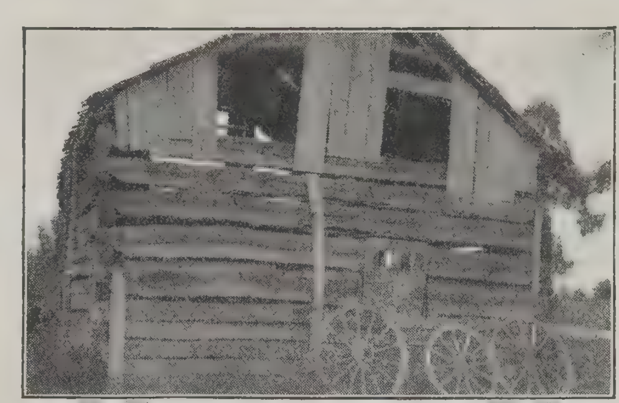
A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Marion—The City That Never Came True

In This Little Story of the Disappointments Suffered by a Dreamer of a Century Ago Lies a Charming Bit of Our Early American History

Today the Public Square Is Crisscrossed by Cow-paths and Ducks Paddle in a Low, Puddled Corner—But It Might Have Been Different

By LEONE KENTON LOWDEN



One-time house of hand-hewn logs, now used as a barn near Marion.

"The public square takes the dust from two pikes."

One of the pioneer log homes built a century ago at Marion.

INDIANA abounds, as I presume does every other spot of the universe, in evidences of misplaced judgment, unfulfilled expectations, weed-grown castles-in-Spain, and in dreams that never came true. And down in the heart of it, lies an unknown town that hoped to be—well, who knows, but the greatest metropolis of the Middle West?

The public square takes the dust from two pikes; its grass is crisscrossed by cow-paths and dotted with stakes; ducks paddle in one low, puddled corner; and the chicken-hawk soars above it. And the leisure of the bovine tribe that browses there is interrupted only by automobilists who scurry by, seldom remembering the frustrated hope that lies buried under the sod of Marion's citadel.

On the east side of the square stand the schoolhouse and the church, still doing service in a shamefaced manner. They had been dignified and august edifices in their time, as was also the blacksmith shop on the north, but age and constant bickering have worn wrinkles in their placid countenances, and one is apt to murmur, as at all things whose youth lies far behind, "They are out of date!"

I have often wondered what was to have been erected in the center of that public square. Perhaps only a monument, dedicated to the city's founder, was to witness the fact that "the good a man does lives after him." Whatever it was, surely it would have been a worthy object to rest in the heart of a city laid out in such minute detail, such infinite love and tenderness, such vaulting hopes, as Marion.

How decidedly more yielding to an historian's pen is the story of a successful city, such as Chicago which grew up like a mushroom with scarcely any foresight at all and but meager solicitude on the part of the settlers, who simply laid hands on an opportunity when it was forced upon them! It is always easy to tell about a favorable termination of anything attempted, or a life that made good—but the town that failed! Who has the courage to recollect that, any more than the story of the man who scrubs our floor and who missed a fortune by one hour?

There isn't a modern home in Marion. Why should there be, indeed? The houses, as well as the habits of the inhabitants and their conservative instincts, have all "been heired." There is no call for progress—that lies dead and buried like a bachelor's love-affair. And the secluded remnant of Marion sheds its leaves in autumn just as it did 100 years ago, without an outward sigh.

Back of Marion, as back of all results either good or bad, lies a cause, and, as frequently happens in the upward-reaching steps of human progress, that cause lay in the heart of youth.

Henry Hanna was a boy as full of dreams as the locust tree with bees or the woods with wild turkeys. He was only a typical pioneer lad, trapping in the winter-time, clearing and planting and harvesting in the summer; Henry never rested, for even in his sleep was he forever forging ahead, capturing the bear, selling the hides, tilling new lands, burning untouched brushwood, conquering the unknown. In his imagination Henry did the most impossible feats. And in this was Henry more than the pioneer—he became an explorer and an inventor.

Henry loved the woods but he craved humankind. The Gleam shone in his eye and his steps were firm as those of Civilization's tread. Though he worked without a protest, yet was his soul in constant turmoil of discontent; at times his feet could scarcely carry the foundation of his castles that builded themselves about his head. And more than all else did Henry Hanna crave what he knew could never be attained on the banks of Whitewater, an everlasting name for himself in the world of affairs.

So it was with more or less of a mental start he heard, one autumn day when he took a bag of grain over to Fairfield to trade for ammunition, that the titles to the lands west, over on Blue River, had been finally taken from the Delaware Indians and were to be extinguished in October of that year, 1818. It was rumored that one Jacob Whetzel would leave Brookville in a few days to explore this new El Dorado.

At once the fervid imagination of Henry Hanna leaped across the forest, and he was blazing a trail through the underbrush and swamps, into the uplands, plowing the mire, fording the gurgling streams, hewing timbers to the right and left of him. A new land! And he, Henry Hanna, the first to set foot on it! There would he erect a house, stake his claim—and build a CITY!

Already in the villages along Whitewater were customs established, ideas confirmed by a few years' time, standards set up not to be disputed; it was a section in the hands of that enemy to youth, conservative age. Henry definitely realized that only in conquering a new area did his opportunity lie. He determined to set out for Blue River at once.

Because of his immature years, he realized that his parents would never consent to his going alone. So that same night he consulted with his nearest friend, Samuel Logan, and begged him to go along. Logan consented provided he could obtain leave of his employer, James Wilson, and promised to ask for it at once.

But Mr. Wilson, who was interested in the young man's information that the savages were to be excluded from the Blue River territory, instead of giving him a leave of absence, proposed that he himself go with the boys and see the fertile region.

It is needless to say that Henry was somewhat disappointed, for he had dreamed of a kingship in the forest with one subject. But his good sense soon came to his rescue, and he knew that not only would it be expedient to have an older man with the expedition but it was almost necessary in order to persuade his father that he might go at all. So matters were quickly arranged and in November, Wilson, who had experience in these matters, led out, accompanied by Samuel Logan and Henry Hanna, the would-be trail-blazer who felt as if he were now a trail-follower.

But Henry offered no complaint because of this discouraging start on the road of his fortune. He appreciated the efforts of his father's neighbor in his behalf, realizing that Wilson could not be entirely disinterested in the matter, and was going to do a bit of fishing for himself. What his motives in going on this venture were, soon became apparent to Henry. He intended setting up a fur-trading post on Blue.

Before this time there had been frequent discussions by the state legislature, meeting at Corydon, on the subject dear to the heart of the pioneer, internal improvements. Two national roads were proposed and a railroad talked of. Young Hanna had listened with eager interest, for months before, to the conversations of his Uncle Ezra Sleeth on this growing question of transportation. But two nights before his journey was to begin, Henry had walked over to his uncle's home six miles away and asked for a copy of a surveyor's guide which he knew his uncle possessed. He recalled many statements his uncle made to him that night.

"If you ever locate, Henry, and feel that you would be at the heart, the throbbing center of this great state of Indiana, set up your cabin where I point on the map." And he touched the parchment with his forefinger; it was only a crude estimate, that map, but it served the purpose.

"Over there is a river, called Blue," continued Mr. Sleeth, "and somewhere about—I've heard William Whetzel tell it and he got it from old Snake Crawl that lived with his father—there is a knoll of dry land—that's the spot as near as I can figure it. If you hit the Jacob Whetzel trail, stick to it, for he's going that way. Now, through that spot will pass two national roads, my boy, two roads and a railway. I'll stake my life, that if there hain't shananigan work done, in a political way, I mean, that spot'll be to make the man famous that builds a city there. Right here, Henry, as near as I can figure it, right here, when you come to the cross of the trail over Blue! Whetzel will follow the Indian path mighty close; and you follow him. He plans to go beyond Blue, but you stick there!"

The words fired the boy's spirit. He fairly quivered with excitement at the possibilities of his venture. The great question in his mind was whether he should tell Wilson or Logan what his uncle had said, or should he return there later? He decided to tell no one the hope of his heart and the only evidence that he gave of the memory of his scheme was the fact that in his bag with his ammunition he carried several sheets of brown paper and several lumps of charcoal.

The pioneers did come to the Whetzel trail, blazed through with axes. Logan was for striking out anew but Wilson decided to follow in the footsteps of a trusted explorer of the wilderness. Hanna, remembering his uncle's words, sided with Wilson and the trail was followed.

A soggy autumn rain and hailstorm one chill night settled down on the travelers just as they built a temporary raft to cross Blue River, or what they presumed was Blue. By the time they reached the opposite shore, their bearskin clothing was almost soaked. It was a miserable night to be out, with a cold wind rising that froze the very marrow in their bones.

In spite of the muscle-ache and cold in his body, Henry Hanna could have cried out for joy. This was the "spot" and it seemed almost as if Providence had sent this miserable rain. It was his secret, but with the gusto of realization he grabbed his ax and struck a tremendous blow to the nearest hickory tree.

"Here goes for the first log for the first home in the city of Marion, future capital of the state of Indiana!"

Logan laughed uproariously; Henry was welcome to his little jokes but for his part he wanted a fire and wanted it quick.

"I'll lend a hand, Hanna, but I reckon we'll dry our feet by the first log of the future capital."

But with the peevishness of a child, Henry refused to allow the log to be cut for firewood. He left his ax and assisted in gathering brushwood for kindling purposes. But the next day the log was cut by Wilson and Hanna, and was the first to be laid in Marion, Indiana, as a rude beginning of a cruder hut which was to serve the party temporarily. They laid in a store of game and cleared a patch on the knoll, which to Logan was a temporary hunting site, to Wilson, a home and a fur-trading station, and to young Hanna, a foundation of a city that should be the Mecca of the West. Oh, for the dreamer of big dreams! We should still be in the savage state were it not for them.

Hanna sprained his ankle and stayed behind when the other two departed. He had a scheme all his own for the future Marion, and with a jealous spirit welcomed an opportunity for working it out in quite his own way. Was he afraid of remaining alone in the nest of the wild? Not a whit! Well-provisioned and sure of himself, Henry Hanna waved his friends a cheery goodby as they started on their return trip.

"Now, keep the wolves and the Indians out of the house," called back Wilson to Hanna leaning heavily against the rude doorpost, "and don't let anything hurt you. I'll bring the boys back with me in a few weeks—"

And that was the last the world ever saw of Henry Hanna!

When Wilson returned with his sons, he could find no trace of the late inhabitant of the shack that had been burned to the ground; and to this day the mystery remains unsolved. Later, under a stone, Wilson found a paper with crude markings on it, which he reckoned to be the plan of a city, drawn by the dreamer in his lonely hours. It of all else belonging to young Hanna had not been utterly destroyed.

But the dream of the young pioneer became the heritage of James Wilson. With the rough brown paper came a realization of the ambitions of the youth; and the possibilities of a city here in the wild woods became in a measure the hope of Wilson. When he came back, he brought only his three sons with him because he feared the cold weather would undermine the health of his wife and the baby.

Secluded Mountain Lake in Western Canada Well-guarded Home of Last Trumpeter Swan

Beautiful Wild Bird, Long Given Up as Extinct, Found in Wilds and Protected

By D. M. LE BOURDAIS

Gannets on Bonaventure Island.

Left—Gannet Ledge on Bonaventure Island.

A LAKE within a sheltering valley in one of the western provinces of Canada, the whereabouts of which is a secret known only to a few officials and bird lovers, constitutes the last refuge of one of North America's largest and most beautiful birds, until recently believed by ornithologists to be extinct—the trumpeter swan.

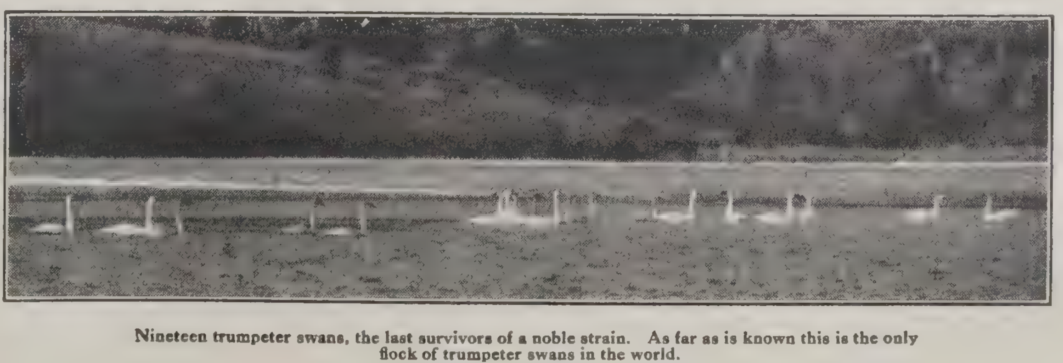
This great bird, pure white but for bill and feet, which are black, with a wing-spread frequently measuring 10 feet, formerly ranged from Hudson Bay to the Rocky Mountains and from the Arctic to Texas on the eastern watershed; and from Southern British Columbia to Southern California on the western slope. It was purely a western bird, very rarely being seen east of the Mississippi. It reared its young in the Far North, building its nest of grass, rushes and feathers near the water, in which from two to six eggs were laid; and with the approach of winter sailed southward, its great sonorous cry, said to resemble the note of a French horn, heralding its approach for miles in advance. But not much more is known about its habits, because before the books on American ornithology were written it had become extremely rare.

Its exceptional size undoubtedly was one of the principal reasons for its undoing. Weighing from 20 to 30 pounds, and sometimes as much as 38 pounds, the trumpeter swan offered much more than the usual inducements to the huntsman. And then it is quite probable that the number of these birds was never at any time particularly great, for its size would again most likely handicap it in periods of food scarcity. At any rate, while yet the passenger pigeon, now extinct, was darkening the skies with its clouds, the trumpeter swan had begun to become scarce. And for many years, until quite recently, ornithologists have classed it with the great auk and the wild pigeon. They studied specimens preserved in museums and little hoped ever to observe one in actual life.

Then one day about two years ago word came to the commissioner of national parks at Ottawa that a flock of trumpeter swans had been discovered in this western lake. On previous occasions similar messages had been received. But in each case on investigation it was found that the supposed trumpeters were none other than the comparatively numerous whistling swans. The commissioner, however, had not entirely given up hope that some day in some part of the Dominion's vast unexplored, or little explored, territory a flock of these birds might yet be found. And he therefore ordered a careful investigation by a competent ornithologist. Back came the report: Without a doubt they were trumpeter swans! Aside from their great size they possessed the other characteristics, the long and comparatively narrow bill and the peculiar horn-like cry.

Immediately a guardian was appointed whose duty it was to see that the swans were not molested; and arrangements are at present being made to have the district surrounding the lake reserved as a bird sanctuary. A set of motion pictures was taken of the flock so that in the event of any disaster overtaking the birds a record of them would be preserved for posterity. A copy of the film has been presented by the Canadian Government to the United States National Museum. But it is hoped that the trumpeters will continue to increase under the protection of the Migratory Birds Convention, of which Canada and the United States are mutual signatories, backed by a sane public opinion; and that in the not far distant future these beautiful birds may again be seen, not only in a secluded mountain valley of Western Canada—where they remain at present both winter and summer—but more generally distributed over the great interior of the continent from the Arctic to the Gulf of Mexico which was once their native territory.

Perce Rock, a great mass of rock rising 400 feet, long has been a bird refuge.



Nineteen trumpeter swans, the last survivors of a noble strain. As far as is known this is the only flock of trumpeter swans in the world.

What so nearly came to pass in this case has made lovers of wild life stop to consider the plight of many other fine birds that without protection of some sort would doubtless go the way of the trumpeter swan. The gannet is a case in point.

The gannet, or as it is sometimes called, the solan goose, belongs to the same general family as the cormorant, the pelican and a number of others whose toes are similarly webbed. It nests along the ledges of precipitous rocky islets, but 15 all told in the world, of which only two are in North America—in the Gulf of St. Lawrence.

When Jacques Cartier visited the New World in 1534 he found gannets on the Bird Rocks (belonging to the Magdalen group), Percé Rock and Bonaventure Island, off the Gaspé peninsula. At that time a number of other gannetries existed along the coast from the Bay of Fundy to Labrador, but the birds have since been exterminated from all of these but the Bird Rocks and Bonaventure Island.

Along the Gaspé coast the most striking feature is Percé Rock, a great mass of reddish stone splashed with tints of yellow, blue and green, rising abruptly from the sea to a height of 400 feet, about 1,200 feet in length and of an average of 80 feet in width. About midway between the center and one end is a great arched opening rising 100 feet above the surface of the sea and completely piercing the great ledge, from which the rock takes its name. The sides are so steep that without artificial means it is unscalable. On the top of this great rock and on the narrow ledges to be found in places on

The Community's Open Door of the Future

The Wayside Park—Development of Tourist Movement Along Highways Brings Co-operation of Progressive Cities That Welcome Tourists

By FRANZ A. AUST
Professor of Landscape Design, University of Wisconsin.

ONCE, a mere handful of Americans suddenly felt the call of gypsy ancestors. Furthermore, they were lured by their faith in a lot of fun at little expense. So they boldly commenced with one accord to pack the family into the back seat, to tuck in the tents and the coffee pot, to turn on the "gas" and chug away to "vacate" in the great out-of-doors. The mighty tourist movement along our national highways was begun!

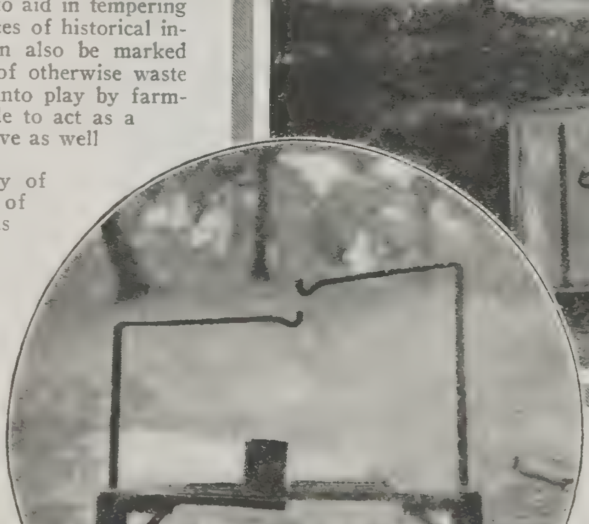
That was three or four years ago. About that time, Denver opened the doors of Overland Park, a site of 160 acres, costing $250,000, as a free tourist camp ground. Denver probably has the honor of being the first city to comprehend the need of a place to pitch those tents and to hang that coffee pot. But she has not been the last.

Today, millions are joining in the new world sport of taking to the country by means of the highways, and in almost any section during the motoring season you have only to pick up a state paper to learn of one or two more new camp sites, the conveniences of which are free to America on wheels. Like proverbial toadstool shelters, thousands of them have sprung up overnight, and there will be many more. Some will be of short-lived growth, while others have come to abide with us, to be a blessing to the community, to the state, and to the nation as a whole. The wayside park, well-selected, well-planned, well-furnished, and well-supervised, is a wayside park well-born.

It often happens that when the chief citizens of a community begin to realize that tourists leave behind in their smoky trail each year something of substantial money value as well as the odor of the "national perfume," they feel that it is time for them to act. The very first question to ask, therefore, in selecting a camp site is: How useful is it going to be? For the best and most lasting wayside parks today are those which serve local town and country folk as well as folk from afar who halt to pitch camp for the night in a quiet, sheltered spot.

Most wayside parks naturally are established along the great trunk highways. Wherever possible, then, these sites should be so chosen that they will preserve, both for now and for the years to come, the beautiful things of nature. A spot which gives a view across a landscape framed by large trees is well selected; or an inspiring survey of the country from a hilltop. A fine piece of virgin timber or of second-growth timber can be preserved to add to that tree-growing area which every farming community should have to aid in tempering weather conditions. Places of historical interest within a state can also be marked and saved. Even a bit of otherwise waste ground can be brought into play by farmers, and this can be made to act as a forest and a game preserve as well as a camp-fire site.

In the coulee country of Wisconsin is the county of La Crosse, made famous by the tales of Hamlin Garland. It is the place where the author lived when a boy. This county has set aside 16 wayside parks, from one to five acres in size. Most of these were given by public-spirited citizens to be play and picnic grounds for the communities in which they live and to extend the welcoming hand to the stranger who motors that way. A clear, bubbling spring, a brook trickling over its stones, a view across a fruitful valley, the sight of the great Mississippi from the top of a bluff, an old Indian trail; these have often been suggestions for choosing the little park's ideal location.



One of the delightfully convenient open fireplaces to be found in Minneapolis parks.

Many country and small-town localities in many states have had no place to "play" until the incoming of tourists has made the park, large or small, seem a necessity. Every wayside park can have homemade swings and teeter-totters for the children; it can be a place to encourage the "community-family" picnic and the joys of the wiener and the corn roast. Never has the get-together-out-of-doors spirit been so strong within us as it is today, and this very spirit is going to be a mighty bond toward a stronger national life.

If the wayside park is to furnish best comfort for those who are seeking the gypsy life as well as for the stay-at-homes, however, there are certain special details to consider. There must be trees to shelter from storm as well as from heat. But this shelter must be such that it will never be a danger to those who are stopping there. Virgin trees, especially, must be chosen with care, for they are sometimes likely to break in severe gales where the stand has been cut from around them. Trees of second-growth timber, on the other hand, are often ideal because they better withstand the attacks of the king of the winds. A variety of trees is always good because this is likely to insure a permanent stand.

CAMPING GROUNDS
KEEP THEM CLEAN
PUT OUT FIRES
PLACE RUBBISH IN CANS
"The wayside park, well-selected, well-planned, well-furnished and well-supervised, is a wayside park well-born."

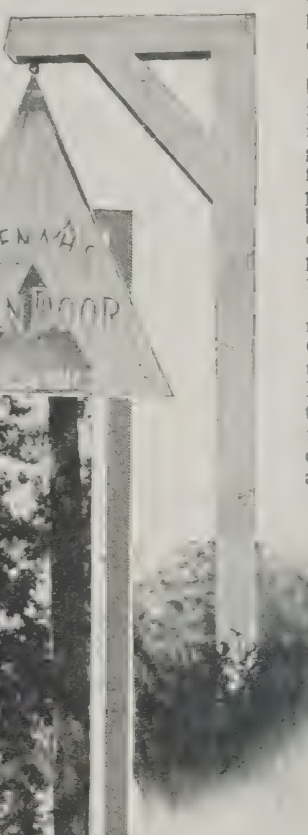
A place which will remain fairly dry even though heavens or lakes or streams open their floodgates is another item of comfort gratefully received by those who dwell for the time in canvas halls. Drainage must be good, therefore, and the banks of lake or stream sufficiently high. That facilities for pure drinking water, on the other hand, are of greatest necessity needs only to be mentioned—"lest we forget."

Some wayside parks already established are to be commended on account of their excellent sign systems which clearly point the way. In one state the road markers of the highway commission are used two or three miles distant along the road which leads to camp. Across the center of one of these markers appear the words, "Camp Site" with an arrow pointing the way. Arrows within the gates of the park are almost always sufficient to mark the direction toward water supply.

And then, of course, every well-planned wayside park has posted rules to maintain sanitary conditions, to help in the care of rubbish, and to give direction for the building of fires. One inoffensive signboard even delicately suggests:

"That little children following you
May through life's leisure hours
Share lavish nature's treasures, too,
Please, tourist, spare those flowers."

One of the first sight-seeing trips the hungry traveler or picknicker takes is to find the place where he may build a fire and hang that coffee pot. Some parks provide a carefully prepared and sheltered stove and supply abundant wood. The camper's kitchen and rest room, well furnished, are a convenience indeed greatly appreciated in wet and stormy weather. But what is there within every man, woman and child of us which bids us delight in the blaze of the open fire?



The sign of the community's "Open Door" at Neenah, Wisconsin.

The parks of Minneapolis have met this primitive longing most efficiently. There, iron racks are provided with gratings extending over the fire. These can be used for pots and kettles, or they can be lowered, and swinging cranes then furnish the suspension place for pails and for that treasured coffee pot.

At Butte, Montana, a recreational park in Columbia Gardens has gone still further with the open-fire idea. Here a fireplace large enough to accommodate ten or fifteen families at a time has been carefully built with chimney and main body lined with fire brick.

A wayside park, even though it have all the finest equipment of electric lighting, pavilions, rest rooms, kitchens, fireplaces, is better never established unless it can have proper supervision and policing. This is a problem which each community must work out for itself. Only in this way can the park be a safe privilege for the visitor. Only by this means can it be a boon to the home folk living near.

There are two especially effective ways of policing a camping site. One means is that of giving the caretaker of the grounds the powers of an officer. In addition to his other duties, when tourists drive in he asks them to register, and soon they expect to do so just as guests in a hotel expect to register. Another method of efficient supervising is carried out in some places where a farmer lives close by. He serves as officer and is paid for his work by the town in whose interest the tourist park exists. He, too, sees that all visitors register; he sees that lights are turned out in the park at a certain hour at night; he attends to the locking of the gates when 10 o'clock comes.

Unless private parks are properly policed, they should be licensed as a hotel is licensed. But where they have neither supervision nor license, they also, like the unpoliced public park, should not for a moment be allowed to exist.

The closer mingling of the folk of one state with those of another cannot but make us a nation more closely united. What is better advertising for a state than that a well-satisfied visitor go to his home feeling kindly toward that state whose communities have cordially opened their doors to him by way of a well-equipped camping place? What is there which widens the portals of the outside world for the folk of any rural or city community so much as meeting and mingling with the America of other parts? The doors of a wayside park can indeed swing both ways.

In the capital city of one of our states, the business men's clubs send two of their members to act as hosts in their tourist park each evening during the summer season. Here where tourists from nearly every state in the Union halt to spend the night, these business men make themselves known and welcome the strangers to their city and to their state. America has been criticized for having allowed the hospitality of her homes to become a lost art. No longer, it is said, do we play the genial host to the chance stranger as our ancestors did. If this is true, perhaps it is in order that we may step into the realm of that greater hospitality—community hospitality—and hang out our latchstring on the branch of a great sheltering tree in America's new institution—the Wayside Park.

"An Old-fashioned Winter? Yes, Sir-ee!"

Any Day Now You May Read the Gooseboner's Dire Prophecy That All the "Signs" That Never Fail Point to a Long, Hard Winter

By GEORGE S. BLISS

WITH the first feel of crisp November mornings, people begin to concern themselves with winter. The winter-weather forecasters, "who haven't missed it in 30 years," flash into the limelight to deliver their several prognostications.

They are usually press-agented by space writers, and their dope is published, with full knowledge that it has no significance, simply because "people like to read that sort of thing, you know."

Said forecasters are often referred to as "gooseboners," but the goosebone is losing its hold generally on the reading public, and it is becoming the proper thing to be a "nature student," whatever that may imply.

With little or no reliable data to fortify their statements, but with faulty memories and firm convictions, these would-be forecasters invite attention to numerous "sure signs" that indicate the character of the coming winter.

Mayhap it was a good season for nuts and acorns, and the squirrels stored an unusually large supply. If so, then the "nature student" surmised that the squirrels had received advanced notice of a long, hard winter, and were prepared accordingly.

Possibly heavy rains had filled the ponds to their brims just at the time when the muskrats were building their houses. They built them large and high enough to get a dry chamber above the water, which subsided later and left large houses in view. Large muskrat houses are said to be the old Indian sign of a hard winter, and they are so interpreted by many persons at the present day.

Seldom Pick Mild Winter

SOMETIMES early frosts destroy the food supply on the northern breeding grounds, and in consequence the birds begin their southern flight a little earlier than usual.

Whatever the "signs" may be, these forecasters invariably overlook the fact that they are the result of past weather rather than indications of that which is to come.

A warm March will force early blooming of the fruit trees, only to be frosted later. In other words, Nature endeavors to heal her wounds, but she does not fortify herself against *unusual* conditions. For that reason the so-called "signs" have little or no significance.

On rare occasions these forecasters may predict a mild winter, but they generally foresee a "hard one." It would never do to forecast an ordinary winter. It must be something unusual, one extreme or the other, and they have learned that forecasts for a severe winter attract attention and arouse greater interest than the other sort.

Readers remark that "it seems like we are going to have a real old-fashioned winter. The paper says that Mr. So and So, of Bucks County, hasn't missed a forecast in 30 years, and he says we are a-going to have a corker. He is a nature student, and after all that is what counts. Old Dame Nature generally looks out for herself. We haven't had a real winter for a long time. Why, I can remember when I was a boy our first heavy snows used to come about Thanksgiving time, and we would have sleighing until near the end of March. Those were real winters, believe me."

Forecasts Soon Forgotten

REGARDLESS of how much interest or confidence the forecasts may arouse at the time of discussion, they are soon forgotten by the average reader after the paper is laid by. For that reason, if it were possible to forecast the character of a coming season, which it is not, it is doubtful if it would alter the plans or preparations or daily life of Mr. Common People to any great extent.

After they have obtained the desired publicity, the forecasters themselves think little more about the matter unless a severe cold wave occurs. In such case, when the cold has prevailed for three or four days, and all preceding mild conditions have been forgotten, they come again into the limelight. "Didn't I tell you it was going to be a corker? When the corn husks are as thick as they were last fall we always have a cold winter. I never knew it to fail."

Weeks of mild weather may follow the cold wave, and the winter as a whole may accumulate a comfortable temperature excess, but it all passes by without notice because it causes no inconvenience. The forecasters concluded, at the time of the cold wave, that their claims were verified, and later mild weather could not change them, and another successful year was added to their unfailing record.

But returning to the prevailing idea of an old-fashioned winter, the kind we are forever expecting, and the kind we can all remember, but the kind we never seem to get any more. What about it? Is our climate moderating?

If it has changed so much within the memory of those now living, is it a regular change, and if so then what must it have been a thousand years ago, or even in early colonial days? A change at such a rate would soon take us back to the ice age, and we know that the ice age was a long time before the age of man.

If the change is a recent one, then what is the cause of it? Has something broken loose in the universe? Or, are we mistaken about it after all, and is the old-fashioned winter a creation of the imagination? If the climate is not moderating, then how are we to account for the idea being so prevalent? What are the facts in the case, and how can we determine them?

The United States Weather Bureau has completed records for 50 years in nearly all parts of the country. In many places these official records are supplemented by earlier ones that reach back beyond the memory of any living man.

Records are a dependable means for determining such questions, whereas memory is fleeting. In fact, it appears as if there are few things more unreliable than the "memory of the oldest inhabitant." Unless something unusual occurred, there are few persons who could give from memory an accurate description of last week's weather.

It so happens that, at Philadelphia, the Pennsylvania Hospital kept a very good set of weather records for 50 years before those of the United States Weather Bureau were begun. It is known that similar ones were made at a few other places in the early days, but for this discussion, on a century basis, the Philadelphia records should serve admirably.

It is true that in large portions of the country the winters are more severe than those experienced in Philadelphia, but it is also true that in a large portion they are less severe. However, that feature does not affect the one of climatic change, for if the climate is changing it cannot be a local condition. If it is moderating in Philadelphia, and in Boston, and in Detroit, and in many other places as many would have us believe, then it is reasonable to suppose that it is moderating in all parts of the country.

Half-degree Variation

CONDITIONS from day to day may and do vary considerably within comparatively short distances, but when the records for several places in the same country are compared by years, or series of years, such as is necessary to determine climatic conditions, we find them fairly constant in their relations to one another.

We could hardly expect a mild winter in Philadelphia and a severe one in Baltimore or Washington at the same time. Much less could we expect a series of years to show such a discrepancy. A search of the Philadelphia records should furnish reasonably satisfactory evidence as to whether our winters are moderating or not.

The question may arise at the start regarding what period constitutes the winter season. There is a more or less gradual change from midwinter cold to midsummer heat and vice versa. The division of the year into four seasons is an arbitrary one. For our purposes it seems well to consider as winter the period during which freezing temperatures or snow may, at least occasionally, be expected.

In Philadelphia there is little such winter weather in November or April, and the winter season may fairly be considered as embracing the months of December, January, February and March.

On the above basis, the winter mean temperature for the 50 years of the Pennsylvania Hospital records was 35.2°, and for the next 50 years of Weather Bureau records it was 35.7°. This seeming difference of one-half degree may readily be attributed to the difference in exposure or in the character of the instruments.

If we accept it as being exactly as indicated, and conclude thereby that the climate has moderated to that extent, then we must admit that such a slow change would not be perceptible for a period encompassed by the ordinary memory.

A satisfactory method of observing the progress of temperature conditions is to compare the means by decades. This largely eliminates the accidents of short-time periods.

On that basis the winter means at Philadelphia during the last century run in the following degrees: 35.5, 34.6, 35.1, 35.6, 35.1, 34.9, 35.6, 35.3, 35.7, 37.0; and exhibit a rather remarkable uniformity. The higher mean for the last decade was due to the accident of two mild winters within the 10-year period, that of 1912-13 with a mean of 41.1°, and that of 1920-21 with a mean of 41.5°, the latter being the warmest winter on record. This occurrence may be partly responsible for the prevailing belief that our climate is moderating, although the idea was as predominant 10 years ago as it is today.

The average winter in Philadelphia has about 26 inches of snow, which is generally the total of some eight or ten storms. The snow usually melts off within a few days, so the ground is snow-covered about 26 days, or one-fourth of the time. The temperature falls to freezing or below on about 73 days, but remains below freezing on only about 16 days, and those not in consecutive order. Zero temperatures are recorded on the average of one year in four.

This doesn't sound much like the popular idea of an old-fashioned winter, and yet it is the average condition for a century. Averages are midway between extremes, so while this understates the conditions for the occasional severe winters, on the other hand it overdraws the severity of the conditions for the occasional mild winters. Extremes of either type are the exception, and the vast majority of our winters are just the plain ordinary kind.

Three "Hard" Winters in 100 Years

WHEN looking over the records for the last century, three winters stand out prominently as representatives of the severe type. The first in 1855-56, the second in 1874-75, and the third in 1917-18. These closely approximate the idea of an old-fashioned winter, but few persons will remember the first one.

During the winter of 1855-56 the ground was snow-covered for 48 consecutive days, from December 29 until the middle of February. There were 100 days with freezing temperature, although midday temperatures were above freezing at frequent intervals. Freezing occurred on every date, with three exceptions, from December 26 to March 20 inclusive. The coldest was four degrees below zero January 9.

The winter of 1874-75 was equally severe, there being 103 days with freezing. Freezing occurred on every date from December 29 to February 20, fifty-four consecutive days, and the longest period of its kind to be found in the record. The coldest was five degrees below zero January 10.

The more recent winter of 1917-18 had 48 consecutive days with freezing, from December 21 to February 6 inclusive. The coldest was four degrees below zero December 30. There was a total snowfall of 36.9 inches, and the ground was snow-covered for 45 days.

If we consider individual months we will find the extremes fairly well distributed through the century. The warmest Decembers occurred in 1848 and 1889, and the coldest in 1831 and 1876. The warmest Januarys were in 1870 and 1913, and the coldest in 1857 and 1893. The warmest Februarys were in 1834 and 1890, and the coldest in 1838 and 1885. The warmest March records appear in 1859 and 1921, the coldest in 1843 and 1885.

Season Shows No Moderation

THE longest period in which no zero temperatures were recorded was 11 years, from 1841 to 1851 inclusive. The next longest was seven years, from 1905 to 1911 inclusive. The greatest number of consecutive days with constant freezing was 13, from January 10 to 22, 1893. The heaviest winter snowfall was 42.9 inches in 1904-05, and the greatest 24-hour snowfall was 22.4 inches on December 25-26, 1909. The worst winter storm on record was the blizzard of March 12, 1888.

In the final analysis it may be said that there is little to encourage the belief that our winters are moderating. The mistaken idea is largely due to better living conditions that have robbed winter of its sting.

Our memories are impressed chiefly by unusual events. We remember the severe storms and the unusual periods of heat and cold, while moderate and seasonable conditions are soon forgotten.

We remember the times when, as a boy, we got out after a heavy storm and wallowed in the snowdrifts, or tunneled under them, but we do not remember the conditions during the remainder of the winter. We sum up the events that our memories retain and conclude that "it is a long time since we had a real old-fashioned winter."

What Gold Standard Law Did—and Did Not Do

Agitation for Passage of Act Brought Many Promises—Few Performances

By W. H. ALLEN

THE currency act of March, 1900, was the result of *seven years of agitation by foreign bankers* and Wall Street interests. The bankers were opposed to the Sherman Silver law, but it was not until after the panic of 1893 that they found an excuse for advocating its repeal. Having used the panic as an argument against this law, they next proceeded to use it as an argument in favor of the Gold Standard.

The advantages claimed for the newly adopted Gold Standard (1) That we would have no more high money rates; (2) there would be no more great panics like that of 1893; (3) no more clearing-house certificates or suspensions of payments; (4) our big trade balances and this law would restore our credit abroad and enable us to draw plenty of gold from Europe to maintain the gold standard.

But experience proved that not one of these predictions was fulfilled. High money rates did not disappear. We had dear money varying from 25 per cent to 125 per cent on numerous occasions after March, 1900. The prediction that we would have no more great panics like that of 1893 fell far short of fulfillment. We narrowly escaped a great crisis the very next year. Thus Philip King, financial editor of the *Sun* (October 7, 1901), says: "It is now manifest that only the bond purchases of the Secretary of the Treasury averted a money panic of the first dimensions in the business world." Matters must have grown worse a year later; for in the *Sun* (October 2, 1902) the same writer says: "There is perhaps, as yet, small popular realization of the fact that the action taken by the Secretary of the Treasury a week ago for the relief of the money market averted what the wisest men in the financial community declare would have been the greatest panic Wall Street had ever seen."

In extending this aid, the Secretary of the Treasury was only doing just what he did during the one-day panic of December 16, 1899, over two months before the gold standard was adopted. That law had not helped matters a particle. Panics were due in each of the next four years but we staved them off *by averting the exports of gold through the sale of securities abroad,* and *by getting more aid from the Treasury.*

The panic finally came in 1907. In fact, we had three of them in that one year, something we never had before 1900. The last one in October was the worst. Of this crisis, Francis Hirst, editor of the London *Economist,* says: "The crisis which broke out in New York in October, 1907, was the most formidable of its kind ever known. There had never been such an enormous demand for gold." The panic of 1914 was another black eye for the gold standard prophets. As one prominent authority declared: "It was the most sweeping demoralization of credit the world has ever seen."

The crisis of 1907 disclosed another failure of the prophets. They had told us that with the act of 1900 in force there would be no more clearing-house certificates, which meant a suspension of cash payments. But they were issued in 1907 and were out three weeks longer than in 1893, and in much larger volume.

"Most of this currency," says Professor Sprague, *"was illegal. In plain language it was an inconvertible paper money without the sanction of the law."*

In other words, it was fiat money of the very worst kind, such as Jerry Simpson or William J. Bryan never dreamed of.

How We Actually Got Gold

WE WERE also told that the act of 1900 would restore our credit abroad and enable us to borrow gold whenever needed. But here again the prophets came to grief. In less than a year (1901) France rebuffed our great financiers when they tried to borrow more. Other European bankers rebuffed us again in 1906, 1907 and 1912. In 1907 the Bank of France refused to lend us gold unless our government would guarantee payment in gold. President Roosevelt could not give that guarantee and so the panic resulted.

After the panic we got gold by pledging New York City bonds abroad and by rushing grain exports.

The truth is that instead of strengthening our credit, the act of 1900 seems to have weakened it. Ever since that act was adopted nearly every corporation mortgage has had a clause providing for payment in gold. Our power to draw gold from abroad seems to have weakened, too. In the fiscal year ended June 30, 1899, we imported $59,000,000 of gold. But in the fiscal year ended June 30, 1900, we actually exported $3,693,000 more gold than we imported. In the three years ended June 30, 1899, the net imports of gold were $200,000,000, while in the three fiscal years ended June 30, 1902, the net imports were only about $12,000,000. In the fiscal year of 1898, we imported $104,000,000. We never approached that figure again until the World War.

Friends of the gold standard always insist that the act of 1900 has fully justified all expectations. But the foregoing history shows that it has failed in every important particular. Now I proceed to show why it failed.

For the four fiscal years ended June 30, 1901, our exports of merchandise netted $2,345,000,000, while our imports of gold netted only $164,000,000. *What became of the remaining $2,181,000,000?* What did we get in return?

The current explanation given out by the highest authorities was that about $250,000,000 of each year's balance went to cancel our annual foreign debts, for interest due foreign inventors, tourists' expenditures, and the cost of foreign freights, and that the remainder went to repurchase American railroad stocks returned from abroad and to invest in foreign bonds and foreign enterprises. According to Frank A. Vanderlip, we had in these four years repurchased from abroad $1,200,000,000 worth of our stock. In an article in *Scribner's Magazine* (January, 1902) he claimed that we were also investing large sums in foreign enterprises. Another authority, N. T. Bacon, writing in the *Times,* January 1, 1902, estimated that in the 30 months prior to January 1, 1902, we had bought back $525,000,000 worth of our stocks. He also claimed that we were investing many millions in foreign bonds and enterprises.

These several estimates did not agree with my theory of the matter and in articles in the *Banker's Magazine,* July, 1902, and the *Swanee Review,* July-September, 1903 and 1904, I contended that our trade balances were not big enough to offset even our annual foreign debts. Hence, so far from having a surplus of several hundred millions we were running that much behind every year, and selling or pledging our stocks abroad to avert gold exports in the settlement of the deficit.

Foreign Debts Responsible

OPPOSING the claims of the foreign liquidations of our stocks, I gave the reports of the dealings for foreign account on the New York Stock Exchange in every month of the four years ending with 1901. These reports showed an excess of purchases of stocks for foreign account in every one of these four years. The total excess for the entire period amounted to 3,743,000 shares, having an estimated value of $250,000,000. I also gave the reports of foreign investments in our stocks and properties off the Stock Exchange. These amounted to more than $300,000,000. In other words, instead of a liquidation of $1,200,0000,000, as claimed by Mr. Vanderlip, the thrifty foreigners must have gobbled up more than half a billion more of our properties. These are the only detailed reports of such business ever published and, excepting an error in regard to the Rock Island issue, their correctness has never been questioned.

In the second *Swanee Review* article I estimated our annual foreign debts at $750,000,000, and growing. As this was just three times as high as the current estimates it was scouted in financial circles. But later on it was confirmed by some very high authorities. These authorities gave out the following estimates:

1908—Charles F. Spear, financial editor of *Evening Mail*	$ 650,000,000
1909—T. Barlow Walker, banker and capitalist of Minnesota	1,000,000,000
1910—J. T. Talbert, vice-president of National City Bank	1,000,000,000
1911—M. M. Reynolds, financial editor of the *Tribune*	1,500,000,000
1910—Wharton Barker, banker and capitalist of Philadelphia	1,650,000,000
1913—John A. Gardin, vice-president of National City Bank	2,000,000,000

In 1913 the *Wall Street Journal* published an average estimate of bankers which placed the debts at $1,400,000,000. They were indeed growing.

Mr. J. Talbert, in his lecture on "Our National Vice," was the first among the foreign bankers to let in a little light on this matter. But his figures are confusing. He allows $300,000,000 for ocean freights, $200,000,000 for tourists, and only $400,000,000 for interest dues, expatriates, exported heiresses, and alien boards. The most interesting part of Mr. Talbert's view was that "our national vice" was our extravagance in the use of automobiles! "The cost of automobiles," he says, "is not less than $250,000,000 a year: the upkeep amounts to as much more." This vast sum is equivalent to more than the value of the property destroyed in the San Francisco fire. The consequence of such enormous waste may be postponed for a time, but ultimately they must be faced and settled, and so on.

The idea of charging our most serious financial ills on the poor autos seemed to tickle Wall Street and it was much exploited at the time by all the leading financial writers.

Real Financial Situation Hidden

A COUPLE of years later in his "Look at the Facts" Mr. Talbert changed his mind and admitted that the main cause of our financial ills was, not autos, but these foreign debts. These debts, he said, exceeded our yearly trade balance by $500,000,000, and to avert exports of gold in settlement of the deficit we had been borrowing abroad on finance bills, short-term notes, and long-term bonds.

Mr. Talbert admitted that there had been a good deal of misinformation spread abroad about the matter, but he forgot to admit that the sole source of this misinformation was his own associates, the international or foreign bankers. Furthermore, even if we accept Mr. Talbert's lowest estimates of the debts, it follows that all these stories that had been circulated for 10 years previous, about our having hundreds of millions to spare for investments abroad or in foreign bonds, were just barefaced lies intended to deceive the people, and to hide the financial situation. Mr. Talbert's figures fully confirmed my explanation of these fake transactions as set forth in the various articles 10 years before. They were also confirmed by Professor Von Halle, of the University of Berlin, Hartley Withers, and Sir George Paish, of London, all of whom admitted that most of our alleged investments in foreign bonds and enterprises were really financed with foreign capital. The *Banker's Magazine* (April, 1915) made the same admission, although it gave little heed to my explanation as expressed in its own columns 13 years before.

The claim that we were a creditor nation was first heard in 1899 and 1900. In June, 1900, Congressman Jefferson Levy, the banker, estimated that Europe owed us $300,000,000. Lyman J. Gage, Secretary of the Treasury, estimated that we had bought back $200,000,000 worth of securities and still had large amounts due from abroad. The *Times* (October 28, 1900) claimed that hundreds of millions were owed to us by Europe. In its article on the "Financial Situation" (January 7, 1901) the *Times* says: "Exports outrun imports by hundreds on hundreds of millions. And the apparent showing is that something like $500,000,000 of American money is left on balance abroad. That the actual sum is tremendous shows significantly in many ways and in many quarters. International bankers lay stress on it. New York no longer has to contrive ingeniously and continuously to obtain loans abroad. New York has become the lender. Foreign money markets no longer levy taxes upon borrowers here; the concessions come this way, foreign traders, foreign bankers, and foreign governments come across the ocean for financial accommodations." Addressing the Bankers' Club of Chicago (March 12, 1901) George H. Roberts, Director of the Mint, declared that "our trade balances are so large that to attempt to collect them in cash would ruin our customers. A nation with power to amass such credits becomes of necessity an investor in all parts of the world."

These cheery views did not dovetail with my estimate of the situation and I expressed my dissent in several letters to the press in 1900 and 1901. The last letter, which appeared in the *Times,* May 8, 1901, was as follows:

ARE WE "A CREDITOR NATION"?

To the Editor of The New York Times, May 8:

In a recent editorial on "The Liquidation of Trade Balances," you state that "speculation as to how Europe will settle her enormous balances with this country are complicated by uncertainty as to how such settlement has been effected in the past."

Now, I suggest that if our financial experts will look in an entirely opposite direction, and put a common sense construction on what they see, their "speculation" will be, not as to how Europe will settle its balances with us, but as to how we will settle our balances with Europe.

According to the current theory, about one-half of our trade balances is needed to cancel our annual foreign debts for freights, interest dues, and tourists' expenses; the rest goes to pay for returned securities, or is being loaned abroad. But I contend that this theory is wrong. A careful study of the question has convinced me that in recent years these annual foreign debts have grown so enormous that now they more than offset our trade balances, and so we have to export specie and mortgage securities and properties to square the account.

Of course, I know that this pessimistic view will provoke a smile of derision from those who believe in all the fine talk about our becoming a "creditor nation," but, nevertheless, the course of events in the next few months will, I am convinced, prove that it is a correct view of the matter. W. H. ALLEN.

Brooklyn, May 5, 1901.

Just two weeks later the financial world was startled by a dispatch from the Paris correspondent of the *Post* (May 22, 1901) to the effect that American bankers were borrowing immense sums abroad. But the *Post* was so infected with the creditor nation lunacy that it wouldn't believe its own correspondent, and the next day it quoted foreign bankers in denial.

Gold Demand Causes Trouble

BUT a day later, May 24, the *Sun* published the statements of other bankers showing that we had been borrowing heavily abroad. According to Professor Von Halle, "More American finance bills were being floated abroad at that time (1901) than ever before."

It became known later, that in May, 1901, we owed Europe about $250,000,000. So that I was from $500,000,000 to $750,000,000 nearer the truth than the great financial authorities at that time. If any financial writer had made as good a guess, the event would have been made much of as a great beat. But it happened to be an outsider who made the guess and the great newspapers were not likely to exploit a matter which convicted them of being ignorant or dupes. It seems inconceivable that Secretary Gage and George E. Roberts, Director of the Mint, and other government officials, could be so blind in this matter. But there are the facts.

The foregoing plainly shows that the Act of 1900 failed to justify the predictions of its advocates. *It was foreign debts, not the want of a gold standard, that was the main cause of our financial troubles.* It was these debts that caused high money rates and panics.

The cash in settlement of these debts flows from all parts of the country into the foreign banks of New York. These banks usually invest most of this cash in our stocks and properties and in loans to other banks and on the Stock Exchange. (*More of our gold is used for this speculation than for commercial purposes.*) When there comes from abroad a demand for gold in settlement of the debts, these loans have to be called in. And then the trouble begins. The foreign demand

Women War Against Wild Beasts for Uncle Sam

Hardship and Peril Lot of the Trappers

By JOHN L. VON BLON

AMERICA, with her population of 107,000,000, her many great cities and her tremendous and intensive development, yet is the home of many dangerous animals upon which relentless war must be waged. This condition is mainly due to the immense mountainous area—almost a million square miles—that affords a comparatively secure shelter for the predatory beasts. So serious became their incursions with the advance of civilization into the newer regions and closer to their strongholds that the Federal Government itself began a campaign of extermination in 1915. The most extensive and complete organization in the world is effecting satisfactory decimation. The prosecution of this difficult and dangerous work, in which hundreds of expert trappers and hunters are constantly employed by the Bureau of Biological Survey, United States Department of Agriculture, requires men inured to hardship. Such are those I have met in that elemental life of the primitive fastness, matching human wits against animal cunning; but in sheer pluck, resourcefulness and stamina I have found none the equal of two women, until recently in this exacting service—Mrs. Anna Newman and her daughter, Miss Anna Schneider, a dainty girl still in her 'teens.

When America entered the war, Carl W. Newman, a government trapper, was among the first to go, with a number of co-workers. These red-blooded, rough-and-ready boys of the outdoors made deadly sharpshooters, but their absence crippled an important branch of the Biological Survey. It had been the policy at Washington to have only males in this field but in the exigency four women with special qualifications were engaged, and October 18, 1918, the wife and daughter took up the work Mr. Newman and others had left. Miss Schneider was only 16 years of age. They entered upon their duties determinedly in harsh, forbidding territory, the desert side of the Sierra Nevada, made an unparalleled record, and were happy in their strenuous task. Assuredly it was a strange, seemingly impossible sphere for the gentle sex, but these gritty frontierswomen see nothing unusual about it. Many of their exploits appear incredible but I readily verified them. The cold facts in the official archives attest their efficiency.

Miss Anna Schneider, woman trapper, in two characteristic costumes. Above she is shown with captive coyote.

Though thoroughly trained in their uncommon calling the mother and daughter started under handicap in Mason Valley, Nevada. Paid $90 a month each and required to meet their own expenses, they soon were out of funds. Ranchmen donated horses which they themselves could not master. Mrs. Newman has handled such animals since her childhood and is a superb horsewoman. She broke them to saddle and harness and either was well rewarded by the original owners or sold the reformed equines at good prices. Of two particularly handsome horses that had been fed and labored with two years and then pronounced hopeless she made a spanking, valuable team. She had thrilling experiences and scores of narrow escapes but no failures.

Miss Schneider kept busy with the traps. Since then they have disposed of nearly 400 coyotes, mountain lions, lynxes and bobcats, the principal pests in their large district, operating mostly in Nevada but having their headquarters at Benton, a little Eastern California mining town at the foot of Mt. Montgomery, a stupendous peak more than 14,000 feet high. Together they used 200 No. 3 steel traps, which hold anything smaller than a bear. Each trapper must furnish 50, the government supplying the others. One hundred traps constitute a "line" of five to ten miles. They rode their lines in all kinds of weather, braved blizzards and faced avalanche and swift, icy rivers; were cut off for weeks by roaring storms on heights and in gorges; battled against freezing at high altitudes and fought for breath in engulfing sandblasts on blazing, pitiless wastes; had encounters with fierce animals and endured the innumerable discomforts of "roughing it" in desolate places.

When I called at their cabin at Benton during a spring snow-flurry, Mrs. Newman was at home looking after the live stock. Roughly attired in khaki shirt and breeches, boots and sombrero, she was strikingly youthful in appearance.

Miss Schneider had started at daybreak, on horseback, for a certain canyon 45 miles distant, with an extra mount, two pack animals, camping outfit, grub for three weeks, and a hundred traps. Alone she would be all that time, covering 15 miles daily through three feet of snow, and sleeping at night on a bed of piñon boughs in a tent! Miss Schneider invariably kept within reach a repeating rifle and a heavy revolver and has the reputation of never missing a fair shot. Picking off a coyote at 500 yards is as simple for her as it is for a carpenter to hit a nail on the head. She is a slender, lithe, laughing-eyed girl who attended school at Notre Dame Academy, Alameda, California, until she was 14 and then chose the doorless open, trapping for two years in Arizona, where her mother, too, commenced at 15.

Herd of wild horses on the Nevada desert. Mrs. Anna Newman and her daughter roped and tamed several of these animals.

On one occasion Miss Schneider had captured an old coyote of extraordinary size and concluded to take it to camp alive for study. The enraged "wild dog" made an unexpected attack, got its long, sharp fangs over one of her hands and raked and split it from wrist to finger tips. She was 12 miles out, alone, and the wound was as painful as it was dangerous. She doctored it as best she could and a few hours later came in with the brute that had inflicted it, as nonchalantly as though nothing untoward had occurred. At another time a coyote made away with one of her traps and she trailed it eight days, finally overtaking it.

Early in the spring while moving camp in Mason Valley, Mrs. Newman undertook to ford the Walker River at a point where it appeared shallow, leading her mount and driving two pack horses. Ice in large quantities floating down the stream had caused the water to scoop out at this particular place and she went in to her neck and was nearly drowned by the swift current, the animals also escaping with difficulty. Mrs. Newman rode seven miles with her clothing literally frozen about her.

In addition to their trapping, the energetic and enterprising woman and girl dealt in horses and raised colts for sale, doing a profitable business. At Benton they had 14 head. They kept up their supply by buying unbroken stock and soon "taking off the rough edges," as they expressed it, or going out and capturing wild ones. This they accomplished by building corrals about springs, not closing them entirely, and lassoing the pick of the herds when they came to drink. Like her mother, Miss Schneider can ride a bucking broncho, but one they had just acquired threw her 20 feet into the sagebrush before she could get her feet in the stirrups. Scratched from head to feet she mounted again and rode 25 miles. The next day she used the animal on her "line." While she was attending to bait, the horse broke away and she followed him four days, finding him back in a wild herd. She rode him home and still had him at last accounts. A wild colt caught and transported eight miles in a motor car purchased by the intrepid western heroines now is a fine buckskin.

These wild horses, which most persons believe to belong to fiction, are no more a myth than were the buffaloes half a century ago. They are a spectacular reality, thousands remaining after years of effort at extermination. Their range extends practically all the way from Canada to Mexico. In the Okanogan hills, Washington state, are several thousand of the untamable cayuses. Formerly ranchmen tried corralling and shipping the captured steeds to eastern markets but the expense was found to exceed possible profits so the plan of shooting was adopted, and this has reduced the numbers. In some remote parts they cause settlers on agricultural lands no end of trouble, nipping the range so closely that nothing remains for cattle. They demolish fences, stallions entice away domesticated mares, and sometimes large herds chase cows and sheep to death. Domestic horses which mingle with the wild speedily revert to the outlaw nature and become a menace rather than a blessing to man. Until a year or two ago the state of Nevada paid a bonus for their destruction, and what is considered the last great roundup was made by Clark Ringling and his men, who slew 700.

The origin of these animals is an entertaining story. The earliest Spanish explorers and conquistadores brought with them horses and naturally some strayed. These shifted for themselves under favorable conditions and multiplied rapidly. They were descended from old Moorish stock, which originated in Arabia, and, though comparatively small, possessed the Arab's unvarying energy and carrying ability. That strain became the Indian pony of the lands west of the Mississippi, the wild horse of the Far West, the cayuse of the Oregon and Washington country. Through lack of selection in the sires it degenerated in appearance but retained its stamina and small feet.

The fight against dangerous animals, in which Mrs. Newman and Miss Schneider had a part, is carried on by the national government, the methods being trapping, shooting and poisoning. From the first two, satisfactory records can be obtained and these show that since the inception of the work in 1915 about 135,000 beasts have been killed and accounted for, while it is believed that by poisoning as many more have been destroyed. This does not take into consideration the extremely heavy execution wrought by states, counties, cattle associations and individuals, which is beyond reckoning. Many of the states and even counties work in co-operation with the Federal authorities.

Compulsory Education and Separate Schools

Are Private Schools a Menace? A Question of Present Public Interest.

By ROY FRANKLIN COTTRELL

"UNLESS I am utterly mistaken," said Edgar M. Cullen, the retired chief justice of the Court of Appeals of New York, "there is a strong tendency in courts, in legislatures, and, worst of all, in the people themselves, to disregard the most fundamental principles of personal rights.

"Judicial decisions are made, statutes are enacted, and doctrines are publicly advocated which, when I was young, would have shocked the people to the last degree. In those days liberty was deemed the right of the citizen, to live and to act as he thought best, so long as his conduct did not invade a like right on the part of others . . . .

"It has been said that the great misfortune of the day is the mania for regulating all human conduct by statute, from responsibility for which few are exempt; for those who resent, as paternalism or socialism, legislative interference with their own affairs are often most persistent in the attempt to regulate the conduct of others. That there has been of late years a reaction from the faith in individualism which was almost universal in free countries in the middle of the last century is certain."

True words are these. Parliaments and legislative assemblies are now generally expected to furnish a panacea for almost every moral and physical ill; and our own land is not immune from this "mania" that would sweep the world. In certain states today there is being agitated a certain issue which is fraught with unwholesome excitement, distress and danger—it is usually called "Compulsory Education" propaganda. But the real issue involved is, *WHERE* shall the children receive their education?

We heartily endorse compulsory education. For its own well-being and security, the state has a right to demand that all children within its borders be accorded the privilege of a modern education. We maintain that the state is wholly within its just prerogative when it sets certain standards in education, when it requires a stated degree of proficiency in the teaching force, and when it insures that adequate facilities be provided for the health and development of the pupils. But when it prohibits a parent placing his children in a private or church school, which fulfills all of the state's wise educational requirements, then the state clearly transcends its sphere, and violates the liberty of its citizens.

This propaganda is not confined to specific localities, for the proponents of the measure regard their present activities as merely preliminary to a crusade which shall sweep the entire nation and eventually place this legislation upon the Federal statute books. Nor would their efforts necessarily terminate here. Should they destroy the system of church and private schools, a logical continuance of the crusade would bring them into the same antagonism to the secondary Christian school and college, to effect the complete secularization of all such in these United States.

In ancient Sparta, as will be remembered, children were considered the property of the state. At the age of seven, the youths were committed to the charge of public officers who aimed to develop "a nation of soldiers who should despise toil and danger and prefer death to military dishonor." In like manner, prior to the Great War, Prussianism required all children in the grammar grades throughout Germany to attend the public schools—none others then being permitted to operate. In Bolshevist Russia all education is under the arbitrary and absolute control of the state, in order that the Lenine and Trotsky ideals of paternalism, communism, and atheism may be effectually instilled. With their plans and program, the proposed legislation would harmoniously accord; but do we desire to Prussianize or Russianize the public school system of America?

Three centuries ago our forefathers chafed beneath the oppressive and arbitrary yoke of the Old World régime, to escape which they braved the hardships, the privations, and the dangers of the American wilderness. At length, to sever completely the chains that bound them, they waged a desperate warfare; they were victorious; and in their new-found freedom established "a church without a pope and a state without a king." Symbolizing this, on the reverse side of the great seal of the United States they engraved the inscription—*Novus Ordo Seclorum*—meaning "A New Order of Things."

In colonial days, the schools were established and maintained by the churches, and the stalwart builders of the new republic were the product of those Christian colleges. A correct view of things civil and religious was maintained. Even in our own day, statistics give approximately 500 Christian colleges in America, and further show that a very large majority of the prominent men of our land received their collegiate training in sectarian institutions.

"England and America," in the words of another, "use education to establish and defend the ideals of liberty, justice, and righteousness"; and in harmony with this policy, a system of public instruction has been developed in our land of which every red-blooded American is justly proud. Public, private and sectarian schools are equally protected under the Constitution, which, according to the language penned in the Preamble by the fathers, was ordained to "secure the blessings of liberty to ourselves and our posterity."

Today, a new and grave situation confronts us. William Allen White, in his recent article in *Collier's*, entitled, "What's the Matter with America," makes this analysis:

"For a hundred years we have pinned our faith to two improving agencies in this country: education and a rising economic status.

"We have said that we can take the low-grade stock of Europe and teach it three years of Latin, spherical trigonometry, a year of physics, a modern language, some United States history, and Longfellow's epics, and make it fit for a self-governing democracy; if only you give it modern plumbing, fresh air, motor cars, a living wage, and a helping hand.

"But these things are not working. The motor car bandits, grafters, thugs, city hall bosses, and municipal tyrants of various sorts, all live in the pink-cotton and tinfoil environment to which we have pinned our faith. Indeed, most of these rascals have been educated through our taxes, and so taught to undo us.

"Education and environment will help, but they will not cure. For we are missing something somewhere."

Mr. White emphasizes the generally accepted scientific truth that acquired characters are not transmitted to offspring, and that only natural characteristics born with the individual are in turn passed on to the succeeding generation. He continues:

"We are taxing ourselves by the million to teach the children absolutely nothing that will help them in their relation to the state . . . . Does the average high school graduate know more than an idiot about practical civic morality, as we of the last century like to imagine that we knew civic morality? We keep feeding our beloved progeny educational folderol and fudge, and wonder why our children have no stamina, why they are morally undernourished."

The things we are "missing" in our modern curriculum is moral stamina and the stabilizing influence of religion. The family altar in the American home is fast becoming antique; the church concerns itself principally with adults, not with children; and in one brief hour once in seven days, the Sunday school cannot be expected to build sufficient moral and spiritual fiber to compensate for the remaining portion of the entire week.

So well qualified an authority as the United States Commissioner of Education, the Honorable Philander P. Claxton, in a lecture dealing with this question, spoke as follows:

"I believe in the public school system. It has been the salvation of our democracy, but the private schools and colleges have been the salvation of the public schools. These private institutions have their place in our educational system. They prevent it becoming autocratic and arbitrary, and encourage its growth along new lines." Again he said:

"In this country we have, and I hope we shall continue to have, separation of church and state. It is not the prerogative of the public schools to impart religious teaching under our system of government. I take it for granted that no one here would want what some other countries of the past ages had . . . . The object of our public schools is to make good citizens for the state . . . . It is the business of the churches to teach religion."

Marion—the City That Never Came True

Concluded from page 6

The fur-trading post became popular and neighbors of Fairfield were urged to come. Through those years, James Wilson did not give up the goal he had set his heart upon, partly from selfish motives but largely because a boy had dreamed of a city in the wilderness that should bear the name of his hero of Revolutionary fame. Wilson wrote to legislators and those who might be interested or influential in gaining the location of roads in this section of the country; at night he worked upon and improved the original plat made by Hanna, who would never return or need it. With the advent of settlers, Wilson began to spread his message of Marion which was to be the county seat of the unformed county. The believers took up the cry of their leader.

But with all his activity, Mr. Wilson saw the first lopping off of his adopted dream, when a site for the state capital was selected a number of miles north of Marion. A number of incidents had prevented the surveying of the section by authorities; the county was not yet organized due to uncertain political manipulation. But undaunted, James Wilson, by the aid of John Sleeth, at last "laid out" Marion and the plat was recorded December 27, 1820. History says: "It was surveyed by H. P. Wilson of Franklin County. The town originally consisted of 56 lots and a public square." There must have been mistakes of a peculiar nature in the recording of the plat for the history tells us that the streets were to be 132 feet wide and the lots of an absurd size. Would the young Hanna have done a better job? Probably not, for with the loss of the capital-dream, it is possible he would not have laid out the town at all.

But Wilson and his friends still thought of Marion as the county seat of the new county to be organized. Until 1821 hopes were not yet given up for a state road and a national road to pass through Marion. But the Michigan road did not pass through Marion, and later, the National road went by way of the state capital, instead of the out-of-the-way village. And one by one, James Wilson saw his dreams being shattered.

But there was yet one opportunity. The county would be organized and Marion was the logical place for its chief town. Night after night, as they sat on the backlog before the bright fire, did Wilson and his energetic sons talk and plan how it would be best to enlarge Marion making it fit for the influx of population just as soon as it was named as the county seat.

December 31, 1821, the state legislature passed an enabling act whereby Shelby County could be organized. By this Act, Section 4, it was stipulated, "The circuit and all other courts of the County of Shelby, shall meet and be holden at the house of David Fisher, near the town of Marion, in the said County of Shelby, until suitable accommodations can be had at the seat of justice." It almost looked like a sure thing, didn't it? But wait and see. Later we read:

"The commissioners (follows names of said men), appointed by the legislature to locate the seat of justice of Shelby County, met at the house of David Fisher on the first Monday in July, 1822. They proceeded to examine the several proposed sites, namely; first, Marion, which was the geographical center of the county, second, the farm of Isaac Lemasters who offered a donation of 40 acres, and third, the present site of Shelbyville. . . . . After four days of arduous labor the last-named site was selected. The wisdom of the selection was questioned and the action of the commissioners openly criticised by many. For at that time and for many years subsequent, the present site of Shelbyville was covered with water for a considerable portion of the year, while Marion was comparatively dry."

So Marion lost a crown and a dreamer lost a dream, all through no fault of his own. As a town, that day in July just 100 years ago, Marion sang its swan song. It tried to survive and we must give it credit for the trace that is left of it today.

But the isolated and fenced-in graveyard, in a field just east of the public square of Marion, now holds the most of these useful citizens of a city-that-might-have-been. The gravestones totter over with age and the wild rose bushes grow thick and high. Rich farming lands, owned for the most part by city dwellers or absentee landlords, have taken the place of the interminable forests.

All this may seem sectional and local but is it not also world-wide? Somebody erred in the case of Marion, but who would venture to point one finger of scorn at any who builded in those foundation days either for good or for ill? Their lot was rigorous at the best, and we give them credit for the good they have accomplished. Marion is only one "if" in a world that is full of them.

Talking Turnips and Dancing Doornails

Concluded from page 3

pass." The one? Shelley calls it the "spirit of Nature."

Shelley had derived many of his thoughts from the philosophies of ancient Greeks and Hindus.

Some 3,000 years ago, the sages of India had startled the ancient western and southern Asiatic world by speaking of Brahama, the sacred reality. They said: "The Real—Brahama—is one: it appears variously." "Brahama is in fire, and in water . . . . penetrates the whole world . . . . is in the annual crops . . . . in the trees." Yes, Brahama was like the sea; while various things in nature were like foam and waves on the sea's surface. Foam and waves come and go; but the sea abides.

Brahama of the ancient Hindus. Shelley's spirit of Nature. The modern scientist's Energy, perhaps electronic Energy.

Does it seem strange that modern scientists should be talking like early Hindu and Greek sages, and at times even like Medieval alchemists? Well, science has now advanced to the point where it can fulfill actually what the ancients merely dreamed of, and yearned for: namely, such an understanding of the cosmic *power* as would enable man to control that power in his own interest.

The alchemists of the Middle Ages, eager to create "wealth," labored, but in vain, to transform mercury into gold. And now, in the twentieth century, scientists are again bent upon a similar venture. Before this century closes, they will, probably, have accomplished the feat of turning lead into gold. In the process of this transformation will be released tremendous energy that man would use to lighten his labor and create his wealth.

Having converted the "spirit"—that is, the stored-up energy in the atom—of one metal into that of another metal, the scientists will press onward in the same direction. Presently, they will be puzzling out how to transform the energy of carrots into that of rats, or the other way round. Watch for the miracles of science.

Doctor Bose proposes to study man himself by the method he has developed to study the behavior of metals and plants.

Science has triumphed, where ancient wisdom, despite all its noble poetry and idealism, had failed, because science climbs up steadily, but unceasingly, from the dust at its foothills to the shimmering snows at the lofty peaks, from simple "sensibility"—"responses"—of doornails and turnips to the mysteries of the human self.

Where the Sun Never Sets on French Colonies

By HAL WALKER

FRANCE has gathered in Marseille the peoples and exhibits of her far-flung empire. France's Colonial Exposition reveals the wonderful diversity of peoples and products which thrive and prosper under the French régime from the north temperate, through the torrid and into the south temperate zone.

Few persons realize that these colonies cover an area slightly larger than the entire area of continental United States. Her possessions extend from St. Pierre et Miquelon, which has figured as a clearance station for liquor smugglers since prohibition in the United States, in the North Atlantic, through Martinique and Guadeloupe in the Antilles, to Guiana on the South American Coast, thence to the islands of Oceanica in the Pacific, southward to the New Hebrides and New Caledonia, farther northward to the Asiatic Coast to the big territory of Indo-China, to the east coast of Africa, in Somaliland, and south again to Madagascar, an empire in itself, to Reunion Island, thence to West Africa, to the Gold and Ivory coasts in the swelter of the equator, northward to Morocco and eastward to Algeria and Tunis, these three presenting another vast empire, and then to the Levant, to Syria, which she holds under mandate from the League of Nations.

Gathered into 50 palaces and pavilions scattered over 90 acres of ground, the exposition is not so large as that at San Francisco in 1915; it is more like the San Diego affair. It is a wonderful record of the expansion of a country which at the end of Napoleon's reign had lost everything overseas, by sale or otherwise.

With true French artistry, each palace is constructed on a model of some famous building in the land whose exhibits it houses. Most pretentious of all is the palace of Indo-China, a reproduction of the center part of the Angkor-Vat Temple, and which forms a square of 230 feet. It is one story, erected on a 33-foot base, at the four corners of which rise towers in the shape of tiaras more than 130 feet from the ground. The central spire of the temple is 180 feet high; eight monumental staircases lead to the porticoes of access and a central flight of 60 steps leads to the main entrance. All the buildings are covered with bas-reliefs cast from models of the original temple in Indo-China.

This exposition opened in April and closes this month. In the Grand Palace and the Palace of Machinery the manufacturers and exporters of France are exhibiting their products which can be of use in the colonies. In the colonial palaces are gathered the products of the soil, of the mines and of the handiwork of the people of each colony, giving the average Frenchman and foreign visitor an opportunity to grasp the possibilities of the over-sea lands. Besides these two there are smaller pavilions in which French home goods are on exhibit, as well as a gallery of Fine Arts displaying the work of Provencal and Colonial Orientalist artists, and the Marseille Palace of Arts where collections of Arts and Crafts dating back to the eighteenth century and earlier are on view.

Algeria, the nearest French colony and only 25 hours across the Mediterranean from Marseille, has a home in a typical North African mosque built around central courts, all glistening white except the glazed tiles on the floors of the courts. This most prosperous of the French colonies has a wide range of exhibits, mostly from the soil, for the country is rich in grazing and farming as well as being a heavy producer of cork.

Tunis is housed in a series of restorations of palaces and mosques, together with the reproductions of streets and markets, the Souks of Kairouan, artisans working in metals, the rug and brass dealers of the bazaar, and a Moorish café where three male musicians, when not dozing over too much coffee, strum everlastingly on stringed instruments, chanting the meanwhile.

Morocco has the reproduction of the battlements of a town with a minaret 120 feet high, inclosing Moorish gardens, paths paved with mosaics, basins and fountains with a copy of one of the finest old fondouks (inner court) of Fez. The exhibits include the handicraft of the natives. Illuminators, painters on wood and stone, weavers and mat-makers work along a native street of Fez.

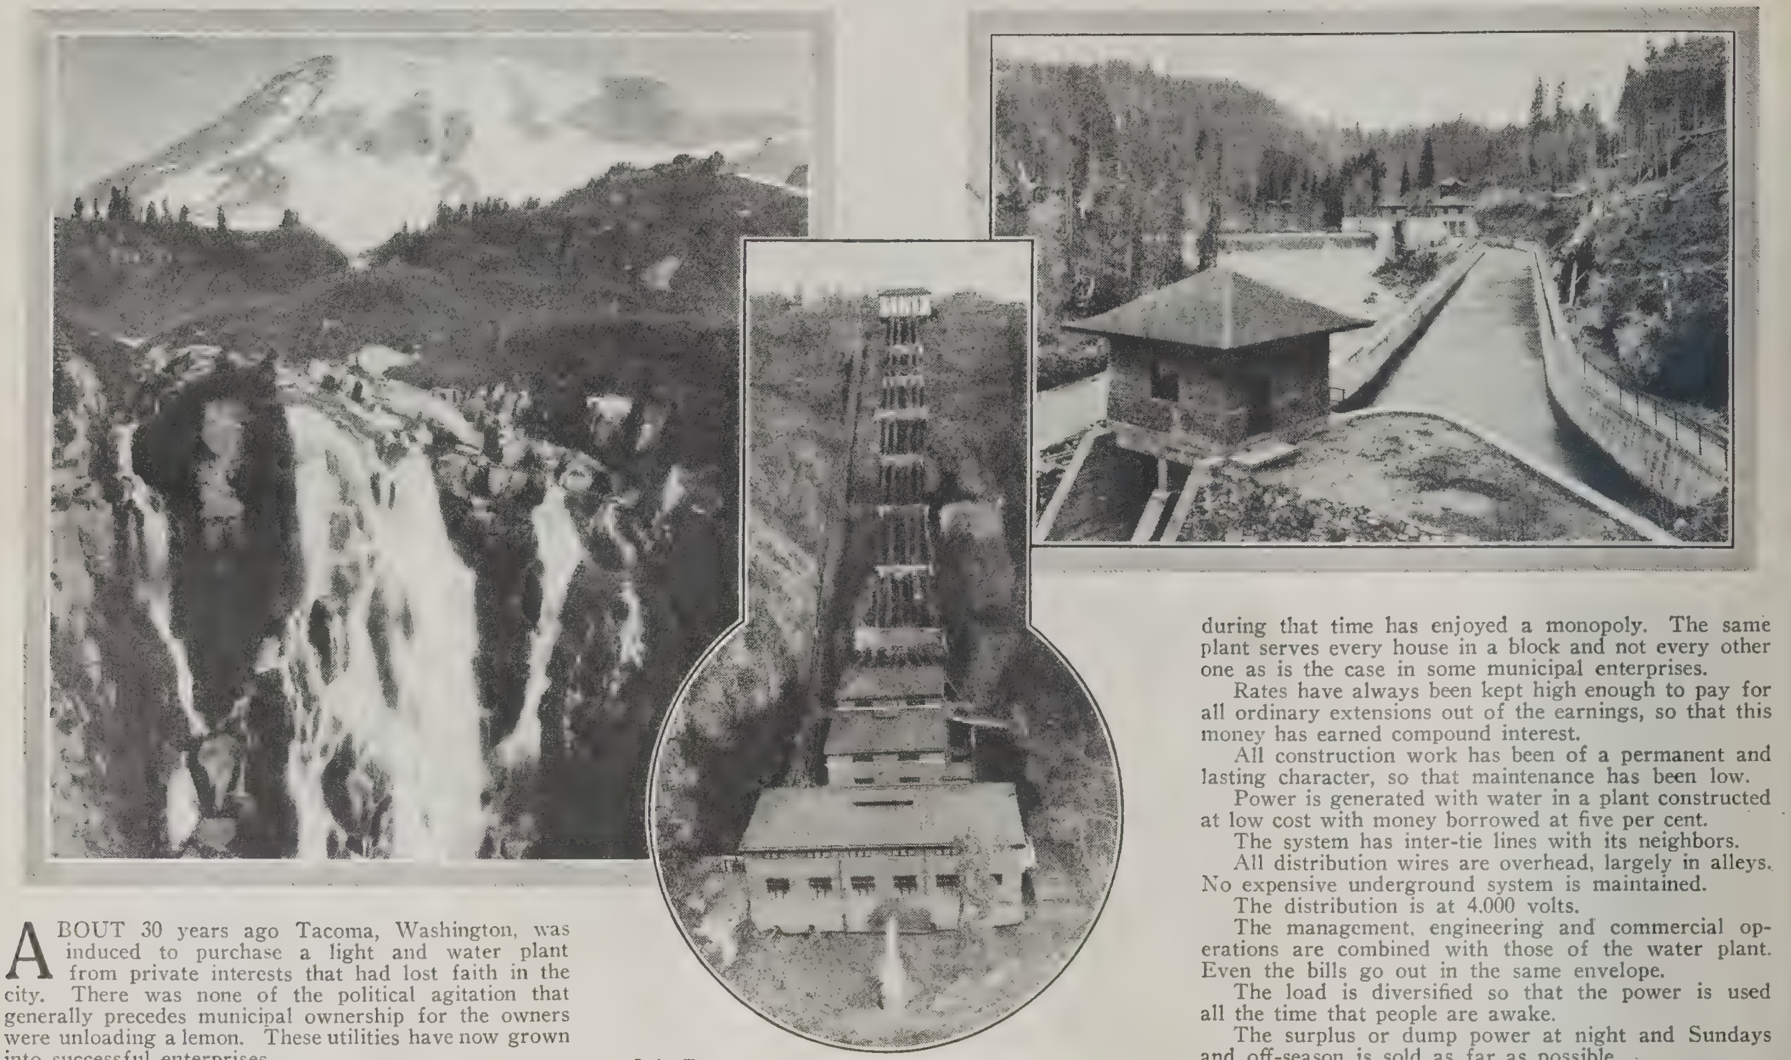
Indo-China, the palace of which was described already, has a large amount of fine lace and silk embroideries, native furniture and the original hardwoods in a special building. To add to the realism of Indo-China there are a number of native boats on the lake surrounding the palace, a real Annamite street, female Cambodian dancers and male dancers from Hué. There are pelicans and bright-hued birds in enclosures in the gardens and two small elephants parade for the delectation of visiting children.

Equatorial Africa has a display of ivory and hardwoods, the latter being also displayed in the manufactured furniture by Marseille firms which import the wood from the tropics. There is also a village made from the native woods which at the close of the exposition is to be presented to a French village in the devastated regions. The main building includes the mairie in the center and a school for boys in one wing and for girls in the other.

It is in the French Western Africa palace that a step is taken back into savagery. This palace is of red stucco with an exhibit hall at one side in which are displayed rare ivories, and wonderful hardwoods, as well as some native handiwork. The enclosure, of which the exhibit hall makes only a small corner, holds villages of Laos, the High Niger and the Congo. Kinky-haired blacks abound. A Soudanese street lined with small shops of artisans working in metal, leather and ivory, as they squat on their heels, leads to the Black Village which is built of straw houses so low that one must stoop to enter and cannot stand upright when once inside. Long, skinny men in red turbans squat in the sunshine weaving native cloth in the same crude fashion with their hands and feet as the Chinese weave silk in the small factories of Canton. There is a corral of camels, goats and sheep to lend realism to the scene.

France found, during the war, that she can rely on her colonies for everything necessary for her existence which she herself cannot supply, when some of these colonies are more developed.

Tacoma Gets Cheap Current With M. O. Plant



Left—The mountain is the source of the river which supplies the electricity. Tacoma calls it Mount Tacoma.

Center—Power house, forebay, gate house and pressure pipes. The hill is 400 feet high.

Right—Headworks, showing dam and diversion gates and settling canal.

ABOUT 30 years ago Tacoma, Washington, was induced to purchase a light and water plant from private interests that had lost faith in the city. There was none of the political agitation that generally precedes municipal ownership for the owners were unloading a lemon. These utilities have now grown into successful enterprises.

Tacoma supplies its people with light at five cents, cooking current at one cent and heating current at one-half cent a kilowatt hour. These are the rates for the past seven years with no increase during the war. It costs the average electric home about $155 a year for light, heat and cooking electricity.

The electric heating of homes is of especial interest. There are now 2,229 electric heating customers with an average load of 6.6 KW.

This heating rate is possible because the climate is mild and each customer's demand is small. There is a diversity of use so that only about 50 per cent of the heaters are used at once. This diversity is caused by the different habits of the people, people being away, and auxiliary use. Then, too, the commercial use stops about the time of day that the greatest use of residence heaters begins. The rate was established to use up the surplus of a water-power plant.

For those cities who want to know how Tacoma rates are possible, the following reasons may be assigned:

The plant has been publicly owned for 30 years and during that time has enjoyed a monopoly. The same plant serves every house in a block and not every other one as is the case in some municipal enterprises.

Rates have always been kept high enough to pay for all ordinary extensions out of the earnings, so that this money has earned compound interest.

All construction work has been of a permanent and lasting character, so that maintenance has been low.

Power is generated with water in a plant constructed at low cost with money borrowed at five per cent.

The system has inter-tie lines with its neighbors.

All distribution wires are overhead, largely in alleys. No expensive underground system is maintained.

The distribution is at 4,000 volts.

The management, engineering and commercial operations are combined with those of the water plant. Even the bills go out in the same envelope.

The load is diversified so that the power is used all the time that people are awake.

The surplus or dump power at night and Sundays and off-season is sold as far as possible.

The wide use of electricity has been encouraged by low rates after the expenses of service are covered.

The operating and constructing crews are well paid and work efficiently with very little turnover.

Foresight provided for the future so that the plant went through the pressure of war with power to spare and money in the bank.

The management has the benefit of the brains of the whole community, for the engineers, bankers and public-spirited men of the city watch the actions of the city officials so that it is hard for them to go far wrong.

The finances of the electric system are in fine shape. A report shows a surplus of $3,536,341.37, of which $660,707.27 was added in 1921.

Secluded Mountain Lake in Western Canada

Concluded from page 7

its sides gannets once nested, but modern firearms have proved too much for them and gannets are no longer to be found there. It is still, however, the nesting-place of innumerable herring gulls and cormorants, and for this reason as well as its impressive grandeur and striking beauty it, with the Bird Rocks and Bonaventure Island, was created a national bird sanctuary in 1919. During the nesting season its thickly clustered cap of gulls gives it the appearance of a snow-crowned peak. With protection, the gannets may some day again take up their ancient abode on Percé Rock.

Bonaventure Island lies about three miles offshore southwest of Percé Rock. It is roughly circular, about three miles in diameter, and on the east and south rises in perpendicular cliffs in some places as high as 400 feet above the sea. On these cliffs great numbers of gannets, murres, razor-billed auks and puffins build their nests, but the great majority are gannets.

Bird Rocks, comprising three in number, the largest of which has an area on top of about seven acres, lie farther out in the Gulf and provide a home for about 15,000 sea birds, including about 2,500 gannets.

The gannet is one of the most magnificent birds to be found in the world. Its plumage is a rich, creamy white, excepting for the outer edge of the wings, which are jet black. It is a large bird measuring on an average five feet from tip to tip.

Gannets live to great ages, some authorities even going so far as to hint that they might live beyond the century mark. One ground for this belief is the fact that they take fully three years to reach maturity. For the first year the plumage of the young bird is almost black, and this gradually changes until by the conclusion of the third year its adult plumage of pure white has been attained.

At the age of about three months the nestling tries out his pinions for the first time and essays a flight out over the ocean. Occasionally the bird misjudges its strength and tumbles down the face of the cliff to the next ledge, sometimes with disastrous results.

Mackerel, herring, cod and, in fact, any fish that the gannet can get down its gullet—and it has been known to bolt a fish up to 17 inches in length—are its natural food. Its eyes are placed in such manner that its sight with both eyes is forward and it is exceptionally keen-visioned. As it flies above the surface of the sea it suddenly drops straight down upon its prey beneath the waves, sometimes from a height of 100 feet or more, frequently penetrating the water to an equal depth as has been demonstrated by its being caught in herring nets set at such depths below the surface. A flock of these beautiful birds diving into the sea above a school of mackerel or herring is most imposing.

A peculiar feature of the gannet is the presence of subcutaneous air-cells practically surrounding the body, but particularly over the breast and abdomen, which are capable of considerable distention. These are supposed by certain authorities to be for the purpose of softening the jar occasioned by its entry into the water from such great heights, but it is just possible that they might also be storage cells for use while the bird is submerged under water.

Of the 15 breeding places of the gannet which are known, nine are on rocks off the coast of the British Isles, four are in Iceland and the Faroes and two are in the Gulf of St. Lawrence, already referred to.

To the untiring efforts of a citizen of the United States, Dr. John M. Clarke, director of the state museum of the University of the State of New York, who for many years past has taken a very great interest in the gannetries in the Gulf of St. Lawrence, and a few devoted bird lovers in Canada, credit is due for the establishment of Bonaventure Island, Percé Rock and the Bird Rocks as sanctuaries for the feathered creatures, let us hope for all time to come.

What Gold Standard Law Did—and Did Not Do

Concluded from page 10

for gold, and the resulting calling of loans, has been the cause of high money rates and all the great panics, and most of the near panics in our history; before and after the adoption of the gold standard.

The act of 1900 did not reduce any of these foreign debts. On the contrary it fostered their growth, and so worsened matters.

If this act had not been adopted the bankers argued that gold would go to a premium and our silver and paper money would depreciate in value 50 per cent. But suppose it did; what then?

Among the first to feel the effect would be the importers and the consumers of foreign goods and luxuries, expatriates, tourists, migratory aliens, foreign steamship owners, foreign investors and foreign bankers. As to the effect on imported goods we could prosper without them. There is no other country in the world with such varied resources and so independent of other countries as the United States. Substitutes for some of these goods could be made here and thus furnish employment to our idle labor. *In this way the discount on our dollar would have all the effect of a protective tariff.* In one respect it would be more effective as it would bear heavily on our luxuries and gewgaws. Expatriates and tourists would suffer, as every dollar they spent abroad would cost two dollars of our money. But the great body of our people who stay at home would not suffer and it is their interest we are considering here. Foreign investors would suffer, too, but we can provide our own capital under a proper currency system. The last, sometimes the first, to suffer would be the foreign banker. The 50 cent dollar *as we now see* would discourage importation of foreign goods, expatriates, tourists, migratory aliens and foreign investments. This, in turn, would greatly lessen the demand for foreign exchange and for those bankers who promote foreign investments in our stocks and properties. Small wonder that these bankers fought against the American silver or paper dollar.

If these bankers had told the truth, and explained that it was the annual debts, not the want of a gold dollar, that was the cause of our trouble, the people would never have adopted the act of 1900. Instead they would have taken prompt action to lessen these debts in every possible way. But the bankers persisted in their tale, and now we see the result. The debts grew by leaps and bounds from $500,000,000 in 1898 to $750,000,000 in 1904, $1,000,000,000 in 1909 and $1,400,000,000 in 1913. Thus our great railroads, banks, our largest industrial plants, and much of our mining land and real estate has passed under the control of these same foreign bankers and foreign capitalists.

Summed up, we were suffering from the same old-fashioned complaint that has brought nations and individuals to grief from time immemorial. We were living beyond our means. Our outgo exceeded our income. We have played the part of prodigal and we are reaping prodigal's reward. The other fellow has the money and the goods; we have the experience. Will we learn from this experience?

Mountaineering a Month in Memory of Muir

How 300 Californians Take to the High Sierras Once Each Year for 30 Days at an Average Cost of $100

By HARRY H. DUNN

THIS year there moved out of San Francisco and Los Angeles two miniature unarmed armies, traveling by train and descending on the town of Visalia, Tulare County. This united force of some 300, meeting in the shadow of the far-flung peaks of the Sierra Nevada, consisted of both men and women, was organized into divisions, commanded by captains, led by guides, followed by mule trains, and accompanied by as well-managed a commissary as ever fed a regiment of real troops on the march.

At Visalia, the Pullmans were abandoned, an electric railroad commandeered and the whole party carried to Lemon Cove, where, parked in long lines, stood motor stages sufficient to take the party as far up the middle fork of the Kaweah River as roads would permit. At the end of the road, each member picked up his or her duffel bag, limited to 35 pounds, and marched four miles to a point in the Giant Forest, where four cooks, a line of sheet-iron stoves, rustic tables, and abundant camping space awaited them beneath the arching branches of the largest redwood trees in the world.

One month later, this army came out of the Sierra Nevada but in the meantime it had traveled some 200 or 300 miles through the lofty mountains, climbed half a dozen peaks, saw the crystal lakes wherein head the Kings and Kern and Kaweah rivers, crossed the K-K-K divide, living in the open, sleeping without tents, getting intimately acquainted with America's loveliest mountains, and seeing America first at first-hand. They were the same men and women who went into the mountains, and yet they were not the same. They had come closer to the changeless creations of nature, nearer to the eternal hills, and had been carried back, for a few weeks at least, to the elemental form of life. The result was greater admiration for the wild world, increased knowledge of their own state and their own country, and augmented strength for the work of the remainder of the year.

One division of the Sierra Club being barged across a river on its way into the highest mountains on the Pacific slope.

The month had cost each one approximately $100 for outfit, food, transportation and incidentals. No one of them could have lived so well in his or her city as he or she had lived in Nature's boarding house, with the earth for a couch and the star-dusted heavens for a roof. They were in good health when they went in; they had to be so or they could not have stood the month of wandering on foot over the ranges, but they were far stronger and better when they came out.

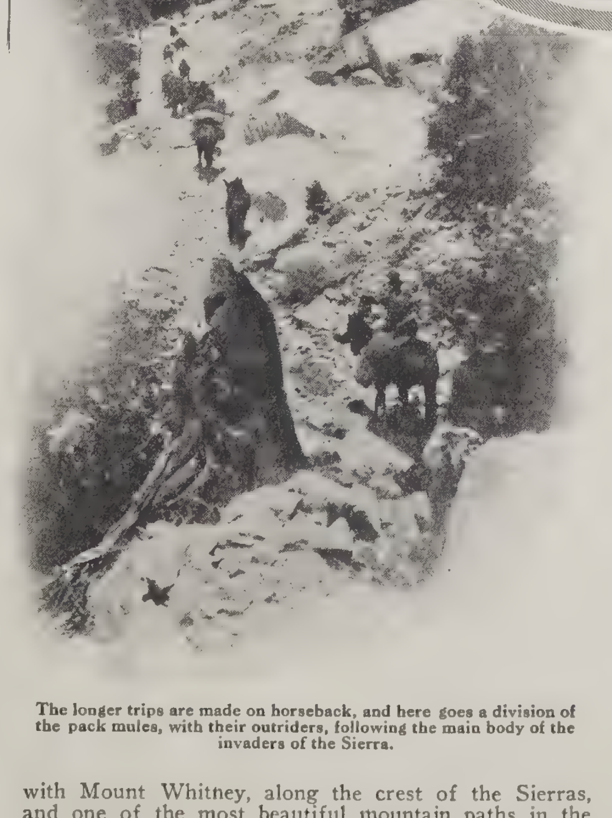
These men and women were of the annual mountain expedition of the Sierra Club, an organization with headquarters in California, but with more than 2,500 members scattered over all the country. Organized in 1892, "to explore, enjoy and render accessible the mountain regions of the Pacific Coast; to publish authentic information concerning them; to enlist the support and co-operation of the people and the government in preserving the forests and other features of the Sierra Nevada Mountains," the Sierra Club has held 21 of these yearly trips. Members, as individuals and in parties, were the first to explore the most inaccessible regions of the Sierra Nevada. There are few among the scores of lofty peaks in California, whose summits have not felt the pressure of the tireless feet of these mountaineers.

These Sierrans have been pioneers into the headwaters of the Kern, Kaweah, Kings, San Joaquin and a score of other rivers; every year the club records the discovery of some new pass, the finding of some unnamed lake, or the ascent of some hitherto unclimbed peak. In geography, geology, forestry, and mammal and bird lore, the members are constantly contributing to scientific and popular knowledge, and the annual bulletin is replete with the records of these discoveries.

The club attributes its origin to the widespread interest in the creation of the Yosemite and Sequoia National parks, in 1890. Two years later, the Sierra Club was formally organized. John Muir, who had led the movement for national parks, was elected the first president of the Sierra Club, and retained that office until his death in 1914. He gave virtually all his time and thought to the building up of the club and the spreading broadcast of those objectives for which it was working. Under his direction, the Sierra Club became a factor in bringing about the re-cession of the Yosemite Valley from the state to the nation in 1905, resulting in vast improvements to that park, and in appropriations, increased from year to year, until now they total nearly a quarter of a million dollars, to maintain this playground.

Thus, the Sierra Club in general is a living, working memorial to John Muir, while its annual trips are especially memorials to him, filled with anecdotes of his life, and often following trails over which he traveled. To every movement establishing a national park or monument, this club gives support, and, at present, is engaged in the task of keeping the national parks of California free from exploitation for commercial purposes. It also is working for the preservation of the last groves of redwoods, the "giant trees" of the early explorers of California, yet standing in Humboldt County. It is mapping the Sierra Nevada, planning trails, and is co-operating with the United States Forest Service in building these trails. An important accomplishment was its obtaining $10,000 to construct the John Muir Trail, connecting Yosemite National Park with Mount Whitney, along the crest of the Sierras, and one of the most beautiful mountain paths in the world. The Sierra Club also is co-operating with the California Fish and Game Commission in stocking fishless lakes and streams. The famous golden trout of the Mount Whitney region have been widely distributed from their original breeding place through the efforts of this organization.

Photo by California Fish and Game Commission.
Mount Shasta, California, the mecca of trips by divisions of the Sierra Club in various seasons. This is only one of the scores of high Sierran peaks conquered by these persistent mountaineers.



The longer trips are made on horseback, and here goes a division of the pack mules, with their outriders, following the main body of the invaders of the Sierra.

The club is working to teach Americans that it is unnecessary for them to go to Europe to find peaks sufficiently difficult to conquer, or to obtain mountain scenery of grandeur and stupendous beauty. Those who have made one trip with the Sierra Club seldom seek mountains of other countries, for they have been introduced to those American ranges in which there are still innumerable undiscovered gorges and unclimbed pinnacles. To bring this opportunity to all the people, the Sierra Club has so organized and so well managed these trips that their cost is nominal.

This year, the Sierra Club directed its steps to the Kern-Kaweah-Kings divide. Establishing its first camp in the Giant Forest, the party traveled up the middle fork of the Kaweah River to Cliff Creek and up Cliff Creek to a small flat, where the second camp was made. Then they went over Black Rock Pass into Little Five Lake Basin, camping there for several days, whence parties and divisions of the main expedition made side trips to Mount Needham, Columbine Lake, and Sawtooth Mountain. Surrounding them were the Five Lakes, the Kaweahs and the Red Spur, with Lost Canyon to the east, and the watershed of the middle fork of the Kaweah to the west.

From this place the party dropped down into the Big Arroyo, climbing up again to Chagoopa Plateau, where a three-day camp was made at Moraine Lake. Thence side trips again were made to the Kaweah Peaks and Red Spur. The next movement was down in Kern River Canyon to Junction Meadow and another camp of a few days, with equally interesting short trips, even into the Kern-Kaweah Canyon, which is as beautiful as the Yosemite, though not so wide a valley. From this point the expedition climbed to Crabtree Meadow, at the base of Mt. Whitney, whose altitude is 14,501 feet. From this camp many made the ascent to the summit of this, one of the highest peaks in North America, and after a few days, the expedition moved on to the head of the Tyndall Creek, close to Mounts Tyndall and Williamson. They then crossed the very crest of the Sierra Nevada at Shepherd's Pass, and took the John Muir Trail around the eastern slope of Junction Peak, crossing the range again at Junction Pass, 13,300 feet above the sea, into the head of Center Basin, which drains into Kings River.

No tents are carried unless members of the party desire to take their own individual tents, when advance notification is given. The club issues a list whose contents weigh 29 pounds, leaving some six pounds for fishing tackle and last-minute comforts. Food and cooking utensils are carried by the commissary department. The club list, which is of value to others who contemplate going into the wilds for a few weeks, is as follows:

Articles	lbs.	ozs.
Sleeping bag (wool comfort or eiderdown)	8	0
Sheet of waterproof silk, 6x7 feet	1	10
Clothing, in addition to that worn:		
Sweater	1	8
Pajamas or nightgown	0	14
One suit underclothing	1	2
Pair light shoes	2	0
Six bandanas	0	8
For Men—		
One pair trousers	1	8
One overshirt	1	0
Six pairs socks	1	0
For Women—		
One pair trousers	1	8
One waist	0	10
Six pairs stockings	1	0
Miscellaneous:		
Toilet articles	2	0
Towels, one bath, two face	1	4
Knapsack or pack harness	1	6
Pocket roll (denim)	1	2
Dunnage bag (3 ft. by 18 inches)	2	0
Candles or flashlight	1	0
Collapsible canvas water bucket	0	10

The Sierra Club maintains several lodges and permanent camps in the mountains, to which the members, individually or in groups, make frequent trips.

UNIV OF THE
URBANA ILL OF ILLINOIS

BRIEFLY TOLD

It is said that Governor Cox, of Ohio, went about the gardens of the Tuilleries in Paris in the cool of the evening with an interpreter, sounding the man-in-the-street for his views on the League of Nations.

Fifty years ago platinum was worth but half the present price of silver.

The "antique" furniture trade flourishes in the town of Dinan, France. Wonderful "ancient" Jacobean sideboards, chairs and spinning wheels may be purchased in profusion. The dealer makes and carves his furniture, copying the originals of many periods. Rain and sun impart the necessary semblance of antiquity to the pieces which stand outside the shop in all kinds of weather.

The Soviet government, hesitating to wreck the statue of Alexander III, standing on a square in Petrograd, has caused the following legend to be hewn into its base: "Your father and your son were executed by the people. You have died peaceably, but to serve as a scarecrow."

Of the 530 men and one woman who are at present members of the House of Representatives and the Senate, more than 300 are lawyers.

A rope 19 feet long, made of 3,000 ground squirrel tails, was recently shipped to the Bureau of Biological Survey of the United States Department of Agriculture. It was made by the Blackfoot Indians who live near Browning, Montana. Fifteen hundred of the pests were killed by the Indians during the spring and summer.

Siamese women stain their teeth black with betel nut to denote their married state.

It will soon be possible for night passengers to view the country through which their train is passing. Powerful flood lights on the roof at the rear of the observation car will uniformly cover a radius of at least 160 degrees, with height and depth sufficient to catch canyons and rivers, mountains and lakes as the train leaves them behind in its onward rush through the darkness. It is possible the lighting system may be extended along the roofs of all coaches lengthwise so that passengers throughout the train will have the benefit of the view on one side or the other. Dynamos driven by the axles of modern Pullmans generate more electricity than is required for present purposes; hence there would be no added expense for current.

A pocket canister or gas mask in the form of a respirator has been invented to alleviate the discomfort and danger to engine crews when they come in contact with the sulphurous locomotive smoke in tunnels. They are cheap and effective and stand up under tests.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Comparative study of photographic plates made at the Arequipa station of the Harvard College Observatory in Peru, has resulted in the discovery of several new variable stars and a large quantity of nebulae. It is said that some of the new stars are thousands of times brighter than the sun.

Benjamin Franklin's first Philadelphia home, where the philosopher took up his residence upon his arrival from Boston, is to be torn down to provide for the approach to the new Delaware River bridge. The house is a ramshackle shanty and the street on which it is situated is only an alley. The windows and panels of the old building, all splendid examples of colonial workmanship, will be preserved by the curator of Independence Hall.

Rubber-block paving is to be placed on St. Martin's Lane, London, England. Rubber, in addition to being noiseless, gives a hard, solid foundation, and lasts longer than ordinary paving material, although the initial expense is greater, according to paving experts.

Shells from heavy guns at Fort Sheridan ripped and tore through the exclusive section of Lake Forest, north shore suburb of Chicago, recently. Four shells struck the residence of Francis V. Farwell and others landed on the Cyrus H. McCormick estate. Terror-stricken servants ran screaming from the Farwell house when the bombardment began. The commander of Fort Sheridan rushed to the suburb to make an apology on behalf of the United States Army. Investigation proved that some new recruits trained their one-pounders in the wrong direction and instead of shooting out over Lake Michigan the "rookies" bombarded the suburb.

"Every boy and every girl ought to learn to cook, and every girl ought to learn all the domestic arts included in sewing, the cutting of clothes and the making of garments generally," declared Dr. Charles W. Eliot, president emeritus of Harvard University, in an address to the Woodrow Wilson Club at the university.

An oil-well shooter narrowly escaped death near St. Marys, West Virginia, recently, when a charge of nitroglycerine exploded in a well while he was preparing to lower another shot. When the first shot went off the shooter covered the can of shot number two with his body, lying on the ground. He was covered with a shower of small rocks but the nitro under his body did not explode. The derrick was wrecked and a masthead from the rig fell close to a wagon which contained 60 quarts of nitro. It is believed a stone caused the shell to go off as the well had not been cased.

A Negro boy 13 years old is to be electrocuted in Oklahoma, November 17. The boy murdered a white woman because his brother-in-law had promised him a pig to do it. The brother-in-law was convicted of complicity in the murder and given a life sentence. The 13-year-old boy is held in the Oklahoma penitentiary at McAlester, according to a dispatch.

In the alleged transfer of 80,000 gallons of alcohol by Louis and Abraham Auerbach, and others, of Cleveland, more than $15,000,000 changed hands in a little more than a year. The Auerbach brothers, Abraham Limbert, Morris Moss, Samuel Selker and Moritz Cohen entered pleas of not guilty to indictments charging them with a conspiracy to evade the prohibition laws. The government alleges the defendants withdrew 80,000 gallons of grain alcohol on Federal permits paying about $6 a gallon on the ground they were using it in toilet preparations. It is alleged they sold it to bootleggers for $26 a gallon. The bootleggers, it is said, then diluted it one gallon to three, colored and flavored it and sold it for $64 a gallon.

A touch of realism is added to fire drills in Chicago public schools by the explosion of "movie" bombs causing smoke to flood the corridors and exits. There is no fire but the pupils are not aware of this fact. The conduct of the pupils during the drills is excellent.

A Frenchman, Dr. Gabriel Bidou, has discovered methods to replace paralyzed and useless muscles with mechanical equivalents. In most cases the "artificial muscle" is a spring, so adjusted that when the weight of the body is released from the limb affected, it is brought forward as it would have done had the muscle contracted naturally.

DEPENDABLE INFORMATION

After reading this copy of THE DEARBORN INDEPENDENT you will have observed that the information it contains is based on fact. There is no room for half-truths and misinformation in this publication. THE DEARBORN INDEPENDENT believes that the people of this country prefer facts to buncombe, substantial information and wholesome ideas rather than sensational appeals to the emotions. SELLING U. S. SHORT

An Amazing Fact-story of How Gold Gamblers of Wall Street Sought to Profit by Nation's Misery in Civil War

CHRONICLER OF THE NEGLECTED TRUTH

When Gold Gamblers Sold the Country Short

How Stock Exchange Grew From Hayloft to Marble Palace

What Our Wars Have Meant to Wall Street

Amazing Revelation of How Finance Profits in Times of National Stress

By CHARLES ALBERT COLLMAN

IN A small building, formerly a stable run by an Englishman named Jauncey, about 20 men gathered daily, behind locked doors, in a room on the second floor which had formerly been a hayloft. Their transactions were sworn to secrecy. Such was the New York Stock Exchange of 85 years ago.

Today the home of the Exchange is an impressive structure of white Georgian marble, in the style of Roman renaissance, with an elaborately sculptured façade, and a colonnade of fluted Corinthian columns, between enormous pilasters supporting a pediment containing a celebrated group of marble statuary.

In 1837, the membership fee of the Stock Exchange was $100. Today it costs from $95,000 to $100,000.

In the time when brokers wore high stocks, swallowtail coats and tall chimney-pot hats, they traded in about nine different issues, such as stocks in banks, gaslight, coal and canal companies. They called it a busy day when 400 shares changed hands.

Nowadays more than a thousand issues are listed on the Exchange, and the transactions often exceed a million and a quarter shares.

The financial district started from humble beginnings, and developed slowly with the country, the growth of agriculture, the building of canals and railroads. Its wealth has increased by sudden leaps, and always as the aftermath of wars. During the few years that have elapsed since the last one, it has quadrupled its resources, tripled its stock sales and the scope of its gambling operations. The World War made Wall Street fat.

In the days when the brokers met in Jauncey's stable, which was on the site of the present No. 43 Wall Street, their president, at half past eleven in the morning, called out the names of the few securities traded in. The men quickly struck their bargains and left for the day. Business was not brisk, but it was legitimate.

Civil War Brought Speculation

BUT 25 years later, during the Civil War, saw the birth of those speculative frenzies that have ever since characterized the financial district. Stock exchanges were suddenly multiplied by the war. The New York Stock Exchange occupied quarters in Lord's Court. While it then had only 100 members, it was a "close corporation," and still traded behind locked doors. The brokers, many of them elderly and dignified men, marched into their board room before every call, followed by clerks carrying books in which the records of the trades were kept. Tickers and Atlantic cables were still unknown.

Adjoining the board room was a small chamber leased by an outside group of brokers who conducted a speculation of their own. This was known as Goodwin's Room. On payment of a consideration, one of these outsiders was permitted to sit on a high stool in the vestibule of the board room, where, by placing his ear to the keyhole, he listened to the quotations, which he shouted back for the benefit of his brethren in Goodwin's Room.

A third exchange flourished in the open at William and Beaver streets. But other markets were called into existence through the speculative excitement of the time. There was the New York Gold Exchange, the Mining Exchange, the Open Board of Brokers, and the Coal Hole, a gloomy basement in William street, to which anybody had admission who paid the price of an annual fee.

But frantic speculation from morning to night did not content brokers or speculators. They craved further excitements, and after dinner they frequented the lobbies and halls of uptown hotels, indulging in bids and offers. Later they resorted to "Gallagher's," an elaborate stock and gold gambling hell established at Twenty-fourth street and Broadway.

Wall Street traveled at a killing pace. After consuming a hasty breakfast, the broker studied the stock quotations while riding downtown in the stage. Then he rushed into the arena of one of the exchanges, where he shouted and gesticulated until the luncheon hour, when he ran out to the lunch counter for a few indigestible mouthfuls. Back again then to his treadmill, where he traded until close upon six o'clock. He rode uptown to his evening meal, talking or thinking stocks on the way, and after a dinner consumed in haste, he set out for the night market.

It stands to the credit of the New York Stock Exchange that trading in gold was not popular among its members, for the man who bought gold in Wall Street during the Civil War, openly displayed his distrust of the Union cause. In buying gold and selling it at a profit, he was weakening his government's credit and betting on the defeat of his country. Since this attitude was considered unpatriotic by the 100 members of the Exchange, they finally abolished trading in gold on their board.

However, Wall Street was filled with brokers and gamblers, *and financiers of foreign birth,* who had sympathy neither for the cause of the war, nor for the future of the nation, *so long as they saw a profit to be made.* It was through the influence of this element that the Gold Room and many of the additional exchanges were created, that they might take advantage of the opportunity to sell the country "short." These disloyal gamblers "cornered" gold, and manipulated the market for a rise in the price of the metal. Through their operations, gold rose to 120 in July, 1862. It was quoted at 160 by the following January, and a year later it touched 250. In other words, the Street had succeeded in pounding down the American dollar to a value of 40 cents.

The man who bought gold was really selling greenbacks. So whenever gold ascended in price through the manipulations of financiers, the laborer and the salaried man watched its ascent with dismay. To them it meant poverty and distress. Merchandise costs went higher, and they could buy less with their money.

Congress passed a law against speculation in the metal. Fist fights often occurred on the floor of the Gold Room between those who stood for the Union and those who worked for its downfall. But the quotations on gold still rose, encouraged by heavy withdrawals of the metal by European banking houses, whose representatives in Wall Street were buying the gold for export.

A visitor to the Gold Room in those days compared it with a rat-pit running at full blast, with 20 to 30 men ranged around the rat tragedy, each with a canine under his arm, yelling and howling all at one time. The furniture of the room was extremely simple. It consisted of two iron railings and an indicator. The outer rail fenced off the "lame ducks" and "dead beats"—men who had once been speculators, but who had now been cleaned out. Day after day they came and ranged themselves along the iron grating, looking over at the pit. Among the gamblers three things were in demand—lungs, notebooks and pencils. "Wow-wow-wow, yah-yah-yah," from 20 to 30 throats all at once, from morning to night, from Mondays to Saturdays.

At the same time, "Gallagher's," the uptown speculative hell, attracted dense crowds each night. On the payment of an admission fee of 25 cents, visitors passed beneath the sculptured heads of bulls and bears which decorated the entrance, and watched the scenes in the Gold Room. Speculators, on payment of $250 per annum, gained the privilege of gambling by night as they had already gambled by day. Once the doors opened at half past eight at night, trading proceeded at a furious pace. Speculators rushed from their seats and crowded down the aisle, surging against the tribune. Often they seized and shook one another by the arms and shoulders to gain attention to their bids. Madness prevailed.

A series of scandals and crimes ensued at the height of the gold speculation. On Good Friday, April 14, 1865, which had been a stock and gold holiday in New York City, President Lincoln was assassinated. Early the next day, hungry Wall Street speculators, ignoring their country's loss and the horror of the civilized world, greedily plunged into what they reasoned was a chance to make money. They bought gold heavily from 153 to 160. But on the following Monday morning, the price of the metal fell to 148. The gamblers sustained losses averaging ten points, which wiped out most of their margins.

New York Not So "Hard" Then

GALLAGHER'S night exchange came to an end shortly after the discovery of three financial crimes of speculators who had frequented his resort. Peter R. Mumford, a gold operator and a respected church trustee, suddenly failed and was arrested for drawing a worthless check for $28,200. Two days later, several Stock Exchange houses failed, among them being that of Ketchum, Son & Company. Edward B. Ketchum, junior member of the firm, fled with a hand-satchel full of greenbacks and securities. He had forged checks amounting to millions. He was captured. His aged father, visiting the defaulter in prison, exclaimed: "My son, my son, you have ruined me, but I forgive you."

In those days New York was not hardened to the contemplation of such financial crimes, which today cause only passing comment in the Street. The conscience of the community was shocked. Public resentment rose high against the gold gamblers. The Stock Exchange and the Open Board of Brokers hurriedly adopted resolutions forbidding their members, on pain of expulsion, to deal in the night exchange. Gallagher's was compelled to close its doors.

It was estimated that the financial district had been transacting an annual business in gold and stocks of $6,000,000,000, or about $20,000,000 a day, in a country which at that time had a total population of 35,000,000. The firm of Hallgarten & Herzfeldt headed the list of operations with a yearly business of $169,232,939. Trading in gold lasted for many years thereafter. Great fortunes were founded on it. With the Union cause triumphant, foreign financiers, who for years had opposed it by every means in their power, followed the tide of victory and established themselves in New York. Wall Street's expansion assumed phenomenal proportions. But always a sort of unhealthiness accompanied its growth.

The aggrandizement of the financial district after the Civil War, however, was as nothing when compared with that which has taken place since the World War. Wall Street today is at the very height of its power. But during the latter half of 1914, its prospects seemed dismaying. With the foreign bourses closed, the Stock Exchange suspended its operations, and forbade its members to trade in securities. With streets deserted, the banking lobbies lifeless, a morgue-like atmosphere about the Exchange, a pall of gloom rested for months upon the financial district. Only in New street, at certain hours of the day, one could hear the lugubrious voices of "wildcat" brokers, trading in stocks which distressed speculators were surreptitiously selling out for cash.

But with the turn of the year, the Street awakened to new life. Scores of new corporations were being organized to provide supplies and munitions of war to the European combatants. Now began the period of foreign loans. For the first time in its history, the United States had become a lending country. With our entrance into the war, there succeeded a wild period of industrial activity. Most of the billions raised through government loans were deposited in Wall Street.

The great underwriting banks and trust companies increased their capital with the vast swelling of their deposits. Banking quarters were enlarged, facilities expanded and personnel increased. The National City Bank, the Chase National, the Guaranty Trust Company, enlarged their respective capital stocks by $15,000,000, the Bankers' Trust increasing its capitalization by $10,000,000.

Wall Street's expansion was fast making the United States the money center of the world, which it is today. European, Asiatic and South American government securities became listed in huge quantities on the Stock Exchange, and nations formerly financed by Europe, turned to America for aid. Nowhere was this expansion more marked than on the New York Stock Exchange. Stocks listed on the Exchange in 1913, had amounted to $611,992,230. In 1920, the listings had jumped to $2,155,398,653, an increase of $1,543,406,423.

Some Interesting Figures

THE sales of stock on the Exchange aggregated in 1913 the number of some 83,000,000 shares, with an approximate valuation of $7,170,862,086. Seven years later, in 1920, stock sales aggregated 226,640,395 shares, with an approximate value of $16,511,351,748, or an increase of 275 per cent.

The growth in resources of Wall Street financial institutions can be estimated from the following table:

Banks	1913 Total Resources	1921 Total Resources	Increase
Mechanics & Metals	$ 65,079,000	$173,848,000	$108,769,000
National City	209,793,300	605,035,000	395,241,700
Amer. Exchange	49,928,000	95,921,000	45,993,000
Commerce	146,278,800	318,827,000	172,548,200
Park	103,787,000	163,463,000	59,676,000
First	126,217,200	246,845,000	120,627,800
Trust Companies			
Bankers	117,689,900	284,345,000	166,655,100
Guaranty	141,849,200	425,589,000	283,739,800

The increase in the extent of the banking business in Wall Street since the war can be illustrated by the bank clearings, which, in 1913, aggregated $94,634,281,984 as compared with $243,135,013,364 in 1920, an expansion of nearly 150 billion dollars.

The total resources of the New York City Clearing House banks and the trust companies in 1913 aggregated more than two billions. In 1921 they had grown to nearly five billions. The actual increase in resources of New York City Clearing House institutions in those eight years is represented by the sum of $2,548,872,000.

In truth, the financial district has already outgrown itself. The swollen banking houses can no longer find room for their expansion in the old Wall Street section of the city. They have already overflowed into Broadway, and beyond that thoroughfare into Trinity Place. Even the great Stock Exchange has been compelled to spread beyond the confines of its marble building.

A Wall Street that has made the United States the greatest financial center of the world is a matter of pride to the country. But a Wall Street that because of its accumulated power and resources presumes to dictate to the country and shape public opinion to its own ends, is less pleasant to contemplate.

However, it is a far cry from the old Wall Street hayloft, in which some 15 brokers were wont to foregather to trade in their nine stock issues, in 1837, to the present, when 1,100 board members, whooping and yelling on the floor of their white-and-gold-decorated trading room, watch the annunciator boards to note whether their numbers are being flashed—a sign that they are called to communicate with their brokerage offices. *The bursting money vaults of Wall Street, and the ornate magnificence of its banking houses, are due historically and fundamentally to wealth accumulated during human conflicts, and this fact, whether it spells for the good or ill of the country, the country may as well recognize.*

Illustrated Bible Was Printed in Latin in 1527

Rare Volume, Skillfully Done, Now Reposes in Cambridge, Massachusetts, Library

By F. N. HOLLINGSWORTH

A RARE volume, probably the only one of its kind, has just become the property of the Cambridge, Massachusetts, Public Library through the generosity of a private benefactor.

The book is believed to be the only copy of an early sixteenth century Latin Bible, the work in 1527 of Peter Quentel, a printer of Cologne. The editor was John Rudelius, a graduate of the University of Frankfort, who writes the foreword in good scholastic Latin, dedicating the book "to the most distinguished city of Frankfort, and to the Consuls and Senators most highly esteemed and always to be honored by me, their student and disciple."

The book is in nearly as good condition as when issued from Peter Quentel's press. It introduced the title-page in the front of a book, with a synopsis of its contents. On the title-page is an autograph that is hardly decipherable, of an owner of the book who evidently prized it and possibly had it bound. The binding, with the fastening of the vellum covers and boards to the paper core with a rope, reveals an old method.

This volume is skillfully printed; the text is in Black Letter with numerous woodcuts by Anthony of Worms, and there is rare, devotedly painstaking work in the letterpress. The pages are as bold, black and clear as anything modern printers can do today, while the binding still remains good. The vellum cover, mellowed with age and stained, is perfectly sound. As a specimen of early sixteenth century printing, it will be of interest to American craftsmen, and in rarity and intrinsic value as an ancient book and example of printing, it bids fair to rival the famous Mazarin Bible, for which Henry E. Huntington, the capitalist and collector of rare books, paid $65,000.

Some of the woodcuts in this book, which are much better than the average woodcuts of the period, were used in printing the Grenville copy of Tyndale's English New Testament, published in 1526. Four of the woodcuts are of special interest, as they appear as initial pieces at the head of each page of the Four Gospels. These cuts were evidently made out of blocks of wood before the invention of movable type and cuts, and show an excellence of design and finish that is surprising. They are probably much older than the book itself, or at least the designs were. The four evangelists are represented with their apocalyptic figures—Mark with a lion, Luke with a bull, John with an eagle and Matthew with an angel dipping his stylus in the sunlight.

Coincident with the printing of this book were the ancient book fairs of Cologne and Frankfort, with publishers, printers and scholars coming there from all parts of Europe twice a year, in April and October, to buy and sell books. Booksellers of all nationalities were to be seen there, mingling with scholars who wished to keep informed on the trend of literary thought, and with burghers and others who flocked there to buy picture books of the time, Bibles, histories and chronicles that were offered for sale at the many stalls.

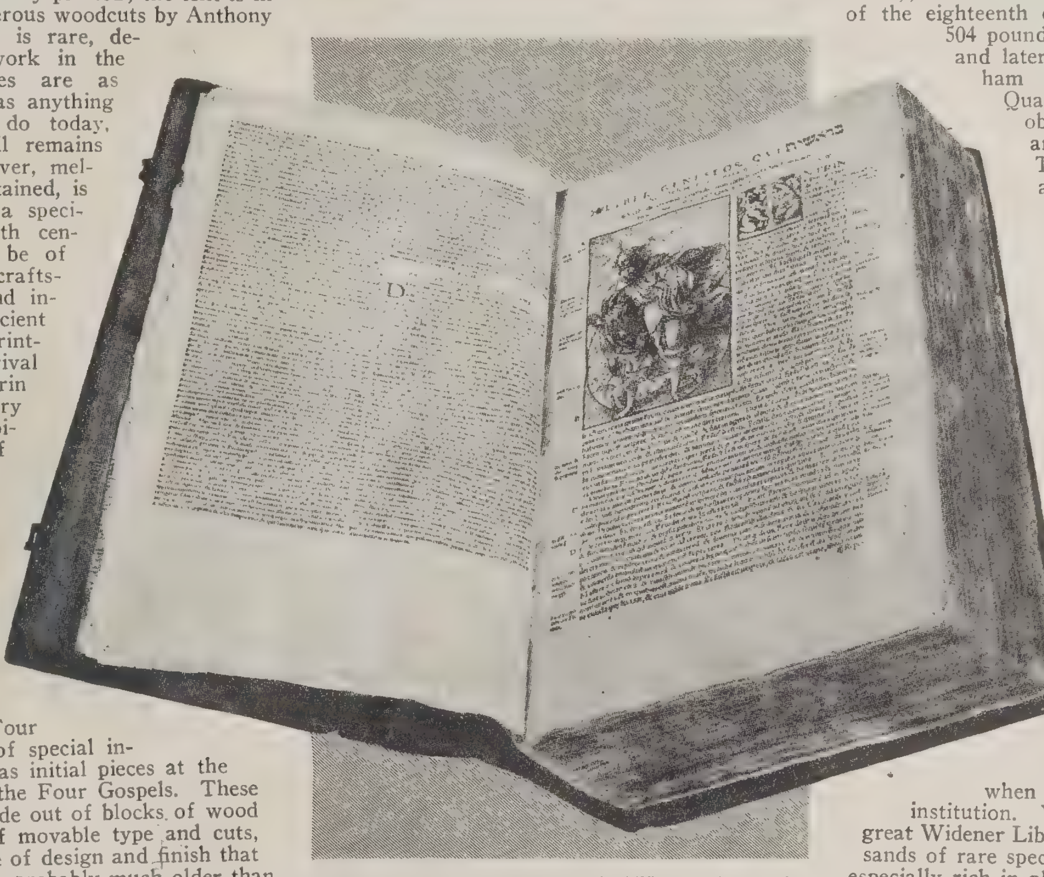
The book quarter of Frankfort was quite extensive, and is described by Etienne as the Athens of Frankfort, but it was inadequate to accommodate the number of people who frequented it. Shops were installed in vacant private houses, cellars and other merchandise shops. The printers stored their books in the Carmelite Monastery, overflowed from the Buchgasse into the neighboring streets and even set up booths and tables in front of St. Leonard's church.

Even in those days pirating of books was common. In fact, this is almost as old as the art of printing. Luther's works, printed at Wittenberg, in 1534, were pirated by Egenolff, of Frankfort, along with Behon's woodcuts. Feyerabend, another printer, became a notorious pirate, and was the target of a special broadsheet issued against him and cried out in the Leipzic book market.

The Hollanders, too, were great pirates of books, and German publishers suffered heavily from books that were reprinted as soon as issued and sold in German markets. Copyright laws were not in force then, and there was no redress from this evil.

Little is known of the history of this Cambridge Bible. In "The Annals of the English Bible," by C. Anderson, is the comment: "At the press of Quentel, in Cologne, it will be remembered that Tyndale was succeeded by his enemy, Cochlaeus, but Rudelius, last year, 1527, succeeded him, and to far better purpose, by a beautiful folio Latin Bible, *"juxta Herbraicam et Graecam veritatem."* In another part of the same set of books, but Volume II, Anderson says: "Rudelius, John, professor at Marburg in Hesse, author of the first edition of the Vulgate, corrected by the Hebrew and Greek, and published at Cologne, early in 1527, before Pagninus, in 167. Rudelius, who died at Lubeck in 1534, dedicated the Bible, not to the Pontiff, as Pagninus did, but to the Senate of Frankfort."

Masch asserts that this book is a reprint of A. Oslander's edition of 1522, with some alterations, and a few original features. But this first edition mentioned by Masch has been entirely destroyed in the 400 years since then, so that this is believed to be the only copy of a Protestant Latin Bible in existence. No other, it is said, has ever turned up. And how the giver of this rarity to Cambridge got hold of it is not given out.



The Rudelius Latin Bible, printed in 1527, the only copy in existence, now in the Cambridge Public Library. Opened at the first chapter of the Book of Genesis, Old Testament. The figure represents God creating the world.

Certainly, as an example of early printing, it is one of the finest copies in existence in this country, at least. The width of its margins shows that when first printed it was much used. It is dog-eared and the title and front pages are rather worn, while the edges have become that deckled appearance so much affected in de luxe editions of books of the present day.

Many persons have the idea that because a book is very old it must be valuable. Thus, when Huntington paid such a big price for the Gutenberg Bible, hundreds of old family Bibles were brought forward and offered for sale in the belief that they were valuable. It is not age alone that makes a book valuable. Its rarity, or its condition, or some special feature about it that differentiates it from some other book of the same general class, aids in increasing value.

Collecting rare books is as old as the art of making books themselves. In the days of the Gutenberg Bible, when Cologne, Frankfort and other cities were the centers of the publishing business, people flocked to these places from all parts of Europe to buy finely printed books for their collections. Kings, princes, dukes and feudal barons counted rare books among their treasures, while monasteries bought many volumes that are in their libraries today. As far back as the Egyptian kings, book collecting was a passion. Not all the specimens were secured by legitimate means—buying and paying for them the price asked. Ptolemy Soter, King of Egypt in 280 B. C., stocked his famous twin library at Alexandria, known as the Bauchium and Serapeum, very largely from books confiscated from travelers who came to that city.

Big prices have been paid for rare books. The "Morte d'Arthur" printed at Westminster in 1483, and known as the Morgan Caxton, brought $42,800 from J. P. Morgan for his collection, because it was the only perfect copy known. Sir Robert Harley, the first Earl of Oxford, paid the equivalent of 60 cents for it when it was put up for sale in 1698. From his hands it passed successively to Bryan Fairfax, Francis Child, grandfather of the Countess of Jersey, to Quaritch in 1885, and thence to the Hoe collection, when it brought 1,950 pounds. Finally Mr. Morgan secured it through his agents.

The Gutenberg Bible bought by Mr. Huntington (this is sometimes known as the Mazarin Bible), has a history as far back as the middle of the eighteenth century. In 1823 it sold for 504 pounds to a brewer named Perkins and later at auction to Lord Ashburnham for 3,400 pounds. Bernard Quaritch, a London book dealer, obtained it at auction in 1897 and priced it at 5,000 pounds. The Hoe collection acquired it and from that it went to the Huntington collection. It is now the property of the state of California. There are said to be 20 copies of the Gutenberg Bible in existence that are authenticated, and seven known fakes.

It is the intention of T. Harrison Cummings, librarian of the Cambridge Public Library, to make a collection of rare and unique Bibles. He has a small nucleus, not only of this early Latin Bible, but several others, one a huge tome that is as much as an ordinary man can lift. This and several others are unique and rare for various reasons. He sees no reason why even a small library like the Cambridge library may not possess such rare treasures, especially when they come as a gift to the institution. While not trying to rival the great Widener Library at Harvard, with its thousands of rare specimens of printing of all kinds, especially rich in playbills, theatrical subjects and kindred matter, contained in the Quincy A. Shaw collection, or the valuable collections of Americana in the Boston Public Library and the library of the Massachusetts Historical Society at Worcester, he means to make the Cambridge collection, just founded, a notable one.

Many discoveries of rare books come entirely by chance. Once reading that the only known copy of Edgar Allen Poe's "Tamerlane" was the property of the British Museum, a clerk in a Boston bookstore, believing this to be improbable, hunted for a second copy. Inside of a half hour he had found one, during his lunch hour at a secondhand bookstore, in a rummage collection on a counter. Soon afterward he sold this copy of "Tamerlane" for $1,950. Later it was resold for $2,050 and again for $2,400. A later sale brought $11,000.

According to a writer in the *Mentor,* the "Mazarin" copy of the Gutenberg Bible is the most celebrated book in the world. It was found by a French bibliographer in the library of Cardinal Mazarin in Paris by mere chance. This is the only real copy of the Gutenberg Bible that can be called a Mazarin Bible. There are other Gutenbergs, but they come from other sources.

While some collectors prefer first editions, others only perfect copies and still others only Americana or special authors. Mr. Morgan's collection specialized in Caxtons, as far as possible. It included between 20 and 30 when his librarian was sent to London to secure the 17 in the library of Lord Amherst of Hackney, put up for sale in 1911. The entire collection was secured for but little more than was paid for the one Hoe Caxton volume, in competition with the British Museum and other buyers.

A New Kind of Revolution

IF YOU want a light on what has happened in Italy, read A. R. Pinci's article on Fascism in the November 11 issue of THE DEARBORN INDEPENDENT. A very great thing has happened in Italy. Italy was chosen for the next seat of Bolshevism. The explosion had already begun. Money furnished by the International Financiers was flowing like wine, *for all such outbreaks are paid for.* In Italy and elsewhere many of the chief movers in revolutionary activities were not Italians. We have photographs of some of them, and certainly they are no more Italian than Trotsky is Russian; they are the International Revolutionists who belong with the International Financiers.

The world waited, as you will remember, for Italy to fall, and for the fire of destruction to sweep onward from that point. The revolution was heralded; the zero hour of catastrophic upheaval actually struck. But in Italy, as elsewhere, there are two races; one of them the backbone of order and progress, the other tinder for any kind of strife. And the stronger race rose in an organization known as the Fascists—signifying a bundle of spears bound together by singleness of purpose. It was really Italian citizenship rising against non-Italian mutiny. Our American newspapers, of course, never gave the truth about it, because they were not aware of the truth. So far as the average American was concerned, it was just one more Revolution proceeding in Italy. It was nothing of the kind; it was Italian citizenship stamping out the fires of Revolution. It appeared like an attack on the government and to a certain extent it was. The Government, bound hand and foot in allegiance to the International Money Power, was sitting idle while the destroyers of Italy had their way. *Nothing harmful ever can happen to any country if the members of the Government are awake.* Against that kind of government the Fascists proceeded, either to arouse it or to supplant it. In this instance, the King of Italy, recognizing the patriotic purpose of the Fascists, took the initiative and asked them to form a Government. Public opinion as a power has been greatly demonstrated in Italy.

This is not an endorsement of all that the Fascists may do. It is to call attention to the fact that the world is astir, that there resides in common citizenship power enough to save the state in spite of the treason of a government which will listen first to the International Money Power. The last report is that Moscow, alarmed at the spread of Fascism in Czecho-Slovakia, Germany, Poland, Hungary and Rumania, is endeavoring to combat it. Fascism seems to mean, in a way "the rule of the proletariat" never could mean, the right of citizenship to save the citizens' rights.

Still Looking to Ultimate Redemption

THE *Citizen,* published at Salt Lake City, sees in the restoration of silver to the world's monetary systems a panacea for the credit breakdown which it claims is impending, and which it alleges will be the result of an under-supply of the metal of final redemption. So far as the restoration of silver to currency systems is concerned, expansion of the money base might make easier the liquidation of present obligations. In this, if the expansion is great enough, inequity might be suffered by creditors, just as now debtors are suffering from inequities. The contraction of the money volume now is a wrong and increases every debt contracted while money was cheaper. Broadening the base to a point where money becomes so much cheaper than when the debt was contracted would be partially to repudiate a debt, just as now the creditor receives more than his due.

Literally, a double money base is impossible. During the entire time when the law recognized silver and gold at a given coinage ratio as equivalent, the real money unit was the dollar of whichever metal happened to be the cheaper at the time. The dearer metal was hoarded. Thus it has occurred that in every war, paper has become the real money in use, both gold and silver hiding.

The rehabilitation of the world cannot be accomplished until there is a realization that no commodity redemption of money is needed. It is as much an error to base a currency on gold and silver as on wheat, or corn, or rye, or cotton. Of course, silver and gold are indestructible to a greater degree than other commodities, but they are of fluctuating value, and they are easily "cornered," giving power into the hands of their possessors.

Ultimate redemption is largely a myth. It means that the *money basis* is wealth, while money is not wealth, merely its representative, its measure, by which the relative values of those articles comprising real wealth are gauged. The difficulty in keeping that measure stable and equitable lies in two factors: the possibility of a sufficient supply and the ability of individuals or groups to control the supply, the latter being a source of grave danger, since by combination its power to purchase is controlled to the direct injury of every owner of real wealth.

Government is the authority for *all* money, whether it be made of a commodity worth something in itself or a mere worthless piece of paper stamped to represent the measure of relative values. The fault with present systems is that Government has delegated its authority to favored groups, and, after delegating this power, borrows and pays interest on the notes it has endorsed, accepting other security than its own bonds for its endorsement. To do this it must rest its power of endorsement upon its own resources, reliance upon which should be sufficient to carry its own debt without interest.

It is folly to say a nation is bankrupt, so long as it has natural resources and other means of production. The danger of bankruptcy lies in the absorption of its production by the interest charges, leaving nothing for itself.

With these ideas of money and its function, it will be seen that the problem of an equitable medium of exchange, either national or international, is not difficult. The trouble is, we give a false importance to money, and put its control into the hands of those who use that control for their own profit.

"Refined Highwaymanship"

IN AN effort of the Federal Reserve Bank of Cleveland to coerce the Farmers and Merchants Bank of Catlettsburg, Kentucky, to affiliate with the Federal Reserve System, the maneuvers of the Cleveland institution have been branded as "refined highwaymanship" by Federal Judge Cochran, of Covington, who has granted the Catlettsburg bank an injunction against further interference by the Federal Bank or its agents. The restraining order will be made permanent unless the Cleveland directors make a better showing than in the preliminary hearing.

According to the *Mid-Continent Banker* for November, Judge Cochran's review of the case relates the following facts:

The injunction is granted as a result of a suit filed July 15, 1921, by plaintiff, alleging methods to have been resorted to by defendant and its agents in seeking to have plaintiff enter the Federal Reserve System and to adopt the par collection plan.

Plaintiff continuing its refusal to accede to the demands of defendant, the latter was charged with employment of collection agents at Catlettsburg, and that an agent from Cleveland came into the plaintiff bank and in "domineering, dictatorial, boisterous manner," created a disturbance; that another agent of defendant came to the plaintiff bank in a gocart and with a gun "for self-protection"; that the latter was frequently accompanied by dogs.

Defendant was also charged with espionage from a store across the street, with holding checks on plaintiff bank until a large amount could be presented at one time and with discrediting plaintiff bank in other ways. This resulted in loss of credit by plaintiff bank, in humiliation to its officers, and necessitated the maintaining of an extraordinary cash reserve, entailing loss in earning power.

In granting the temporary injunction, Judge Cochran declared the methods of the Cleveland Federal Reserve Bank were those of "refined highwaymanship and a holdup," according to the magazine quoted.

The Election

ELECTION is over, and the surprises far outrun the predictions. Not only did the people vote, but they voted emphatically and with discrimination. There does not remain even the politician's comfortable explanation that it was "a landslide." There was no landslide, no blind revulsion rushing angrily in one direction, no passionate torrent of national resentment. The election more resembled a patient application of patient public intelligence to a tangled problem with a view to finding what knot to untie first. It was distinctly an independent election, it was not a swing toward any party. If Republicans suffered it was not because they were Republicans but because their party had the misfortune to be carrying the burden known as Newberryism. Democrats tainted with it were retired as well. The action of the people was moral rather than partisan; Democrats were defeated who might have been elected, but for their Newberryism; and Republicans were defeated for the same reason. States overwhelmingly Republican certainly had some strong reason to return Democrats to the Senate; and it could not have been a political reason, for there are no politics this year; it is indeed the political deadness of things which makes the election the more amazing.

Political majorities have not been changed, but moral majorities have been changed most radically. Moreover, the unexpectedness of the people's action has added a most solemn emphasis of warning to the change. Where defeat was not the penalty, the castigation was made more humiliating than defeat could ever be. It is not difficult to imagine that, wholly defeated, Henry Cabot Lodge might have maintained his pose as the scholar in politics, but going back to Washington by the skin of his teeth, beaten to the ground by a candidate by whom it is no honor to be beaten but only because that candidate offered the only convenient instrument with which to castigate Henry Cabot Lodge, that is humiliation compared with which defeat is something desirably heroic. Re-entering the Senate with a few tail-feathers is worse than being plucked clean.

A total of 10 pro-Newberry Senators went down to defeat—three of them failed of renomination in the primaries, seven of them failed of majorities in the election. In Indiana, where Beveridge defeated New in the primaries, New's pro-Newberry vote being an issue, Beveridge was in turn defeated; and two incidents in the campaign were Beveridge's refusal definitely to say where he stood with reference to Newberryism, and his opponent's freely stated intention of dealing with that kind of political rottenness as he would with any other. It is impossible to interpret the Senatorial elections without reference to this matter which runs like a line of division through the results.

It can be safely said that where the "wets" were not defeated by votes, they were fooled by votes. It is questionable whether a candidate for a minor or even a major office is not subject to prosecution when he announces, "Vote for me and get light wines and beer." We have "blue-sky laws" to prevent the people being buncoed by fake stock speculators; it would seem that in principle the same law ought to protect them from candidates of this caliber. It is equally to be questioned whether citizens who are fooled by their claque are intelligent enough to have the ballot. The fallacy, of course, is found in the inability of these candidates to do anything whatever in the fulfillment of their promise. The two high spots of the "wet" and "dry" contest were California's reported turnover to a "dry" attitude, and the defeat of the author of the Volstead Act. The former was in contradiction of all the prophecies, for California was held to be the one state that would never, no never, acquiesce in the Eighteenth Amendment. But she did. As for Mr. Volstead, though the personal spite of the booze interests was concentrated against him, he has the satisfaction of knowing that the candidate who defeated him is, if possible, "drier" still. The New Jersey incident is susceptible to several interpretations. Before a verdict is pronounced it will be necessary to know whether New Jersey loved Freylinghuysen less or Edwards' "light wines and beer" more. Whether Newberryism defeated Freylinghuysen, or boozism elected Edwards; whether the voters of New Jersey put a premium on frankness, choosing one who is frankly "wet" rather than one who is personally "wet" and publicly "dry"—these are questions for decision.

On the whole, the general election, as it affected Congress, gives great ground for hopefulness. The people have acted efficaciously and without hurrah. The "third party" that has emerged is the Independent Vote in both parties. No group of politicians has won—both groups have lost: the voice of the plain people is heard in the land.

Mr. Ford's Page

MAN is civilized in the degree that he organizes the material concerns of his life. If he is always the victim of pressure, if he is always waiting to be forced from without, he is still in an earlier stage of freedom and privilege. When men could only sail in the direction the wind was blowing, navigation was not a very satisfactory thing. When they learned how to use the wind to sail against the wind, then they were able to organize routes and trade.

Most of what mankind has done until this time is the result of pressure. There has not been much foresight, not much careful organization of means to ends—that is, in a large social way. Some degree of these things has come in private affairs. Once in a while you find a young man who is definitely steering his life toward some goal. Families tend more and more to watch their affairs and defend their interests—much more than they did when everything ran more loosely than it does now. And in business—business being largely private in the motives which move it—there has been effected a very considerable advance in organization for the sake of producing more profitably and of conserving more efficiently.

HOW much we need the discipline of individualism, the hunter type of life, and how long it will survive, no one can say. It will doubtless continue to be the ruling type for as long a time as we need it. Even so, we know that it cannot last; but many of the qualities which it creates will last and will pass over into a type of life which is ruled by design more than by pressure. Most of the improvements we are trying to introduce by way of moral teachings will appear automatically as soon as we study the mechanism of society and the daily service of society which we know as business. Society is a circulatory system and has a circulatory necessity, and most of the "wrong" things are those which interfere with the circulation.

But in the general interest, in the whole generality of individuals and families and businesses, we may gauge our progress by the sense of direction which we have and the degree of directive effort which we exert. It is marvelous that with so little of common direction our multifarious life fits together so well. A city, a nation, is a miracle of a certain workable arrangement emerging from a situation that is made up of all sorts of divergent and antagonistic motives. The explanation is, of course, the outside pressure. We are working in response to Need, and every sort of fulfillment, whatever its motive, finds its place there.

We are constantly catching glimpses, however, of what could be made of all this effort if only it were possible for men to lift their eyes from their own pursuits—from the selfish aspects of their own pursuits—and see how much unnecessary labor, friction and loss there is because we possess no controlling pattern, no unifying policy, no Great Plan for all this energy we are generating. There is, it is true, a zest in individualism that contributes something to life, and maybe it still has much work to perform in the world. By individualism is meant the hunter style of life. The world is regarded as the forest and individuals are huntsmen. The head of the family goes out and fights for what his family needs, and when he carries it home there is the feeling of something won, something plucked out of adverse circumstances. The business house goes out in the same spirit, to round up business, and its winnings are counted great spoil because they are gathered out of competition and all manner of adversity. The central feature of our philosophy of life as at present popularly conceived is just this: that the livelihood is there, that the business is there, that all the things we need are there in that outer jungle of the world where multitudes are scrambling; but our chances of getting these good things depend on our fighting abilities. That is about as far as our philosophy has come, popularly: the comfortable fact that the desired good is there; and then the urgent note to fight for it. If you don't get it, another will; if you are a weakling, another will get it anyway. That is individualism, and doubtless it has its compensations. It has never been successfully wiped out, no not under the most favorable circumstances. The fact would seem to indicate that maybe this form of life is to persist for some time to come, and, if so, it will be because it is the best form of life for the time through which it survives.

But it is time for business to look around and examine its circle. Business has been going according to pressure long enough, it is time to begin to go according to design. Business is in the beginnings of honesty. While honesty is not by any means the general practice, it is recognized as an ideal. It is not ruled out entirely, as it formerly was. It is even a fashion now to speak of Ethics of Business. But honesty is such a terrible thing, it runs its lines in so many directions, it challenges our practices at so many points, that it is hardly surprising that considered merely as honesty, merely as something that *ought* to exist if convenient, it lags sadly in spots.

The fact is we shall not become entirely honest until we *see the whole circle* of the service which we call Business. We don't see it now, most men only see that break in the circle through which they are able to snatch what they want. We think of business as a wheel turning round before us—a vast wheel of fortune, only never stopping. We are a trifle off the fact, there. We are on the wheel, we are going round the circle; we are a part of the circle of service, and our grabbing off has been in the nature of injury to ourselves. But it is proof of the power of a wrong philosophy that, following its terms, you can injure yourself and not realize it at once.

We have made the process break down time after time. In our most highly organized and most trustfully regarded affairs, at the very top of our professional money handling, there have been such blunders and breakdowns and widespreading disaster that one is amazed when one stands back far enough to behold it. Suppose Medicine broke down as often as Banking does. Suppose Engineering broke down as often as Banking does. Suppose Transportation broke down as often as Banking does. And right there, using the word "transportation" as a clue, we come upon the point. Transportation did break down when it was used for something other than Transportation. Medicine exists for the cures it can make, it lives by its cures. Engineering lives by the durable results it can achieve, it lives by its sound achievements. Banking, a profession capable of the highest honor and usefulness, should live by the service it is fitted to render in lubricating the processes of life and its glory should be its success in keeping the community's affairs moving harmoniously and prosperously. It is fitted to do this and it would do this if it regarded itself as part of the circle, instead of just another snatcher sitting beside the wheel, raking off what it can.

The fact that is being driven home to us is that we can't sit by the side of the wheel, or even wrongly think that we are sitting there, and rake off all we can get, without wrecking the whole process and ourselves suffering in the wreckage, for the process itself is circular and interference with it is ruinous. The business community is a living body. Interference with circulation is death. And that is just what we do whenever we pass substitutes for value, whenever we take out more than we put in, whenever our relation with the business process consists in selfish withdrawal more than in serviceable contribution. The system is exceedingly sensitive and these practices break it down.

Maybe it is too early for the grab-all type to see it, but it is none the less true that there can be no merely private increase of wealth. No one is rich in Russia, not even the man with countless billions. Why? Because there is no community wealth. No one grows wealthy unless the community grows wealthy. The poverty of the poor takes value out of every dollar of the rich man's hoard. But the prosperity of the people makes riches real and potent. When you corner wealth, it is like tying up arteries—you are on the way to strangulation of life. Circulation is life.

If we knew this, honesty in business would not be an exotic virtue lugged into it; it would be the logical necessity of business principle. Dishonesty in every form is a crime against circulation upon which the health of business and the prosperity of society depend. That is what makes it so hideous a thing. It is not merely "wrong"; it is stupid.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

"Senatorial Courtesy!" It's a Changed Brand!

Today the Term Has One Meaning: "Keep Off My Political Preserves"; Exchanges Similar to Those Now Heard Once Would Have Meant Duel

By STEPHEN POOLE

SENATORIAL courtesy! A phrase suggestive of politeness on the part of members of the "greatest forum on earth" toward one another. But the casual visitor who spends a few days in Washington and drops in at the Senate galleries sometimes receives a shock when lawmakers, whom he has pictured as dignified and courteous in debate, are found shouting challenges back and forth to settle a controversial matter outside the chamber.

"Senatorial courtesy" in these times merely means that a Senator will not poach on the patronage preserves of a colleague by insisting that a presidential appointee, who, for political or other reasons, is not wanted by a second Senator, be confirmed for office in the latter's state. Nothing so arouses senatorial ire and provokes bad feeling as interference in patronage matters by a Senator from another state. Senator Phipps, of Colorado, a first-term Senator, had this forcibly impressed on him a few weeks ago when a brother Senator assaulted him verbally in violent language. It developed that Phipps had been making inquiries by letter concerning the fitness of several post office nominees in a state for which he had been appointed a "subcommittee" of one by the Senate Post Office Committee. The Colorado Senator, recently recovered from a serious operation, was met in the rear of the Senate chamber with the invitation to "come outside and I will knock your face in." He declined the issue and a brawl just outside the main Senate entrance was averted.

Outbreaks almost as violent took place several times during the session just concluded. The "short and ugly" word was hurled across the chamber on more than one occasion, but invariably deleted in the "copy" prepared for the *Congressional Record* after the offending member had time to cool off.

In the old days before the Civil War the House of Representatives acquired the name of the "Bear Garden" because of the many brawls which took place there, but the Senate has been the scene of most of the recent excitement.

Lacks the Dignity It Once Had

"THE Senate is not the dignified body it once was," said a veteran attaché of one of its committees, who has had acquaintance with Senators stretching back more than a generation.

"I verily believe," he continued, "that if men in the old days had said the things reflecting on one another that are said here now it would mean death to them. Men were more jealous of their honor and reputations in those days, and the language which has become common on the Senate floor in recent years would have meant bloodshed in the days when men were more sensitive in these matters."

This is also the judgment of other veteran observers of the Senate's conduct. The members of this formerly dignified body appear to have become used to a lack of decorum that formerly did not exist. Even the House of Representatives, with its larger membership, is on the whole better behaved. Limitation of debate in that body gives its members less time to indulge in personalities. Occasionally there have been scenes of turbulence in the House, but not nearly so often as in the Senate.

"Senatorial courtesy" we still have with us, but it takes such forms as inserting in the much-abused *Congressional Record* a political speech delivered outside of Congress by a colleague. This makes it frankable and saddles the expense of postage on the taxpayers at large instead of on the man who delivered the speech.

Still another form of "senatorial courtesy" which is not extinct is to have a colleague, in the course of a speech on some pending bill, digress to mention what a wonderful legislator and faithful public servant is Senator Blank, who happens at the moment to be engaged in a primary contest for renomination. Once more the franked envelope is brought into use to place this you-tickle-me-and-I-will-tickle-you praise before the candidate's constituency.

The late Senator "Tom" Watson, of Georgia, who died at his home in Washington, three days after Congress adjourned, was the storm-center of many of these verbal combats which almost culminated in violence. He possessed an exceedingly sharp tongue along with a keen intellect, and he never hesitated to call any Senator to task who, he felt, had reflected on him or contradicted any statement he had made. It was he who denounced Senator Phipps, of Colorado, in unparliamentary language, following a difference over "senatorial courtesy" as applied to post office nominations in Georgia. The fiery Georgian issued a similar defi to Lenroot, of Wisconsin, during a clash on the Senate floor. He notified Lenroot that he must never speak to him directly or address any remarks to him on the floor thereafter.

Another incident which caused a scene was when Senator McKellar, of Tennessee, and Senator "Jim" Reed, of Missouri, had an exciting set-to. After goading McKellar into a fury which caused the Tennessean to question Reed's veracity, Reed said, in his characteristically cold and measured tones: "The Senator from Tennessee has lost his head, what little head he has."

During a night session over the tariff, when Senators' nerves were worn to a frazzle by the interminable debate and long hours, Senator McCumber, of North Dakota, and Senator "Joe" Robinson, of Arkansas, would have come to blows but for the prompt intervention of colleagues. The flare-up came so quickly that the men were almost at each other's throats before other Senators could get between them. That so dry a subject as the tariff should beget such excitement seems extraordinary, and in this case the trouble arose merely over the question of procedure.

Senator Heflin, of Alabama, resented the allegation of Senator Glass, of Virginia, that he had made "six misstatements of fact" within a few minutes, in discussing the Federal Reserve System, and brother Senators were once more called on to restore harmony.

Senator Harrison, of Mississippi, addressing his remarks to Senator Nicholson, of Colorado, during a recent debate on reclamation, said:

"And the Senator and his Republican colleagues sink into insignificance by the side of the name of Theodore Roosevelt, and their record looks like a decimal point by the side of a mountain when their records are compared with the wonderful record embodied in the reclamation policies of Theodore Roosevelt."

Discussion of the nomination of Nat Goldstein as postmaster at St. Louis and its subsequent withdrawal provoked acrimonious discussion in open session of the Senate. It was found impossible to bring about his confirmation owing to charges growing out of the handling of money in the Republican pre-convention presidential campaign.

Here are a few of the *bon mots* exchanged by Harrison and Spencer in the course of this discussion:

Mr. Harrison: All I want to know is, Does the Senator mean that I made a cowardly attack upon Goldstein?

Mr. Spencer: I mean to say that the things which the Senator said—and he knows how I love him personally—

Mr. Harrison: That may be true, but—

Mr. Spencer: The things which the Senator has said about an absent man, in a forum where that man has not access and from which he cannot speak, is a cowardly mode of attack.

Mr. Harrison: Mr. President, I submit that the Senator has not any right to say that I have made a cowardly attack.

Mr. Spencer: May I ask the Senator from Mississippi whether he thinks it is a brave way of attacking a man?

Mr. Harrison: The Senator knows that I would not any more fear Nat Goldstein, or saying what I have said to his face, than I would the Senator himself, and the Senator must remember that when this nomination came in I made a motion to have it considered in open session of the Senate. The Senator tried to cover it with darkness. He would have employed every cloak of secrecy. He wanted to shut the doors, so that what might be said would not reach the public.

Mr. Spencer: Mr. President—

Mr. Harrison: My whole action in this matter has been in the open, on the square, and the Senator knows it. I abhor the consideration of nominations for public office in secrecy. No nominee whose skirts are clean can fear it, and none but whose record is stained dread it.

Closed Sessions Bring Acrimony

MR. SPENCER: I hope the Senator will not get away from the point we are now discussing. Does the Senator think it is a brave thing to attack a man on the floor of the Senate, where he has no opportunity to answer, under a privilege which does not extend to the individual attacked? Is it not unusual on this floor—

Mr. Harrison: The Senator is asking me a question—

Mr. Spencer: But it is not a brave thing to do. It is a cowardly thing to do.

Mr. Harrison: Of course, the Senator knows that accusations of "braver" and "cowardly" can be settled outside the Senate chamber, but the Senator has asked me a question. When a nomination comes in such as this, which stenches to high heaven—and the Senator has admitted recommending this nomination—the people will never know, unless it is discussed in the open, and they are informed of the manner of man being nominated. That is what I have attempted to do in the Goldstein matter. If the Senator had thought that he could possibly put over this nomination, he would today be fighting here for the confirmation of Nat Goldstein.

In executive sessions of the Senate, where nominations are considered behind closed doors, there are many discussions such as this, only, according to those who have heard them, the language is much more to the point than in this instance. If the debates in open session grow more peppery than they have been in recent years, there will have to be additional sergeant at arms appointed to preserve order.

Upon one occasion, a few sessions back, Senator Bankhead, of Alabama, now deceased, in answer to an inquiry from Senator Norris, of Nebraska, on a pending post office appropriation bill, said: "I can give the Senator information, but not intelligence."

Norris retorted: "Of course, it would be impossible for the Senator to impart that which he does not possess."

Recently, when Senator Heflin, of Alabama, after having his discourse before an open-air gathering on the Washington Monument grounds drowned out by the droning of a commercial airplane overhead, offered a resolution to regulate the air by making it unlawful to fly over assemblages, he made a spirited speech in behalf of the measure. He alluded, at one point in his speech, to an Alabama "mouse-colored mule." Whereupon Senator John Sharp Williams, of Mississippi, remarked that, after listening to the Senator's speech, "I am absolutely compelled to say that the Senator from Alabama is absolutely mistaken about the mouse-colored Alabama mule's particular personality and localization. Is not that about the kindest way I could put it, the most charitable way that I could put it?"

A few weeks ago, Senator Carraway, of Arkansas, who had been standing for some minutes waiting for recognition by the chair, threw the chamber into commotion by suddenly shouting at the top of his voice, "Mr. Chairman, Mr. Chairman, Mr. Chairman!" and when recognition did not come forthwith, he launched into a severe scolding of Vice-President Coolidge, in the chair.

"The chair can see only the Republican side of the chamber," shouted Carraway. "I have been on my feet while a dozen Republican Senators have been recognized. If it is to be the practice that only that side of the chamber is to be recognized, I want to know it."

A half-dozen Republican Senators came to the relief of the chair by shouting for "regular order" in tones that drowned out Carraway's high-pitched voice.

Duels were frequent among members of Congress in the days before the Civil War as the result of exchanges on the floor. One of the most memorable was that of William J. Graves, of Kentucky, and Jonathan Cilley, a new member from Maine. Mr. Cilley, in a speech in the House of Representatives, in February, 1838, charged that James Watson Webb, editor of the New York *Courier and Enquirer,* had received a bribe from the Bank of the United States. A few days later Mr. Graves addressed a note to Mr. Cilley, in which he said: "In the interview with you, when you declined to receive from me the note of Mr. Webb, asking whether you were correctly reported in the *Globe,* did you not say, in substance, that, in declining to receive the note, you hoped I would not consider it in any degree disrespectful to myself, and that the ground on which you declined to receive the note was distinctly this: That you could not consent to get yourself into personal difficulties with conductors of public journals for what you thought proper to say in debate, and that you did not rest your objection on anything personal to Mr. Webb as a gentleman?"

Was Finally Patched Up

MR. CILLEY, replying to this letter, said he neither affirmed nor denied anything in regard to Webb's character, and added: "But when you remarked that this course on my part might place you in an unpleasant situation, I stated to you, and now repeat, that I intended by the refusal no disrespect to you."

Graves replied: "I have to inquire whether you declined to receive Mr. Webb's communication on the ground of any personal exception to him as a gentleman, or man of honor. A categorical answer is expected."

Mr. Cilley replied, regretting that his note was not satisfactory, and added: "I cannot admit the right on your part to propound the question to which you ask a categorical answer, and therefore decline any further response to it."

This brought another note from Graves as follows: "As you have declined to accept a communication which I bore to you from Mr. Webb, and as by your note of yesterday you have declined on grounds which would exonerate me from all responsibility growing out of the affair, I am left no other alternative but to ask the satisfaction which is recognized among gentlemen. My friend, Henry A. Wise, is authorized by me to make the arrangements suited to the occasion."

In acknowledging receipt of this note, Cilley named his friend General George W. Jones to "make the arrangements suited to the occasion." The "arrangements" were made and the old dueling ground at Bladensburg, Maryland, just out of Washington, was selected for the settlement of this difficulty. Rifles were the weapons chosen, and, after two exchanges of shots had been without result, Cilley fell dead after the third exchange of fire.

An anti-dueling act was enacted by Congress growing out of this affair, but history shows that this did not entirely end the dueling practice.

Another memorable instance of a clash between well-known Senators which nearly resulted in bloodshed was that between Senator Clay, of Kentucky, and Senator King, of Alabama. This had its inception in the effort to remove, by a Senate resolution, the firm of Blair & Rives as public printers the day following the inauguration of General Harrison as President, March 5, 1841. Senator Clay spoke for the resolution. Senator King offered a resolution reciting that whereas this firm, having been duly elected, should not be removed by a step which meant the abrogation of a government contract. Said Senator King, in defense of Blair:

"Who is this Mr. Blair, who has been so violently assailed on this floor? If my recollection serves me aright, this man Blair resided years ago in Kentucky, where he figured as no inconsiderable personage. He was then the political friend of the Senator from Kentucky (Mr. Clay), his intimate associate, and, if I have not been misinformed, his confidential correspondent. Was he infamous *then,* as now pronounced by the Senator from Kentucky? I presume not. I knew nothing of Mr. Blair, or his character, until he made his ap-

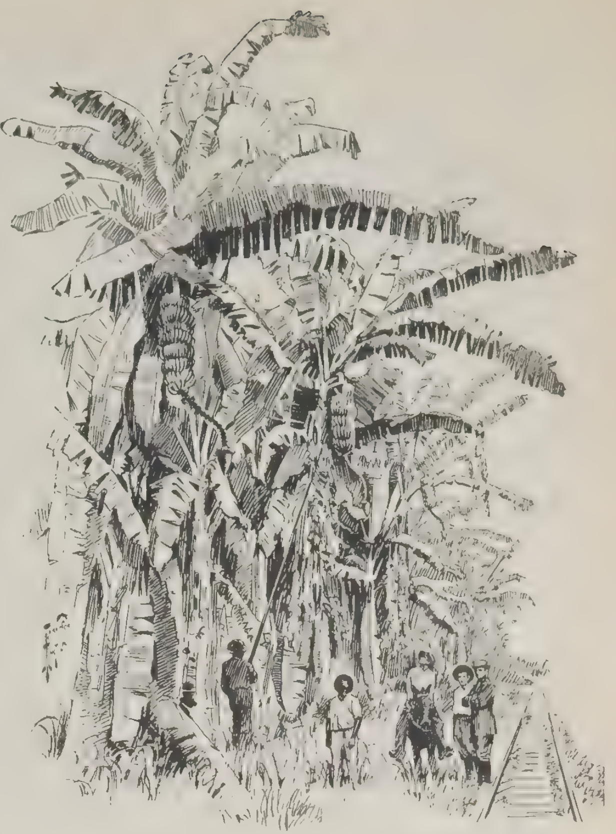
How We Utilize the Sun Energy of the Tropics

The Banana Is a Delicious Pure-food Package of Bottled Sunlight

By GEORGE H. HEALD, M. D.

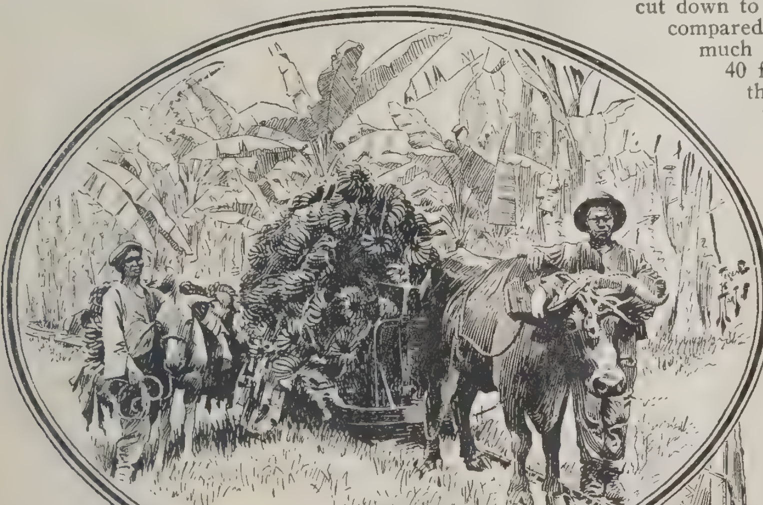


Harvesting the first crop 12 or 14 months after planting.

FOOD is about one-tenth body builder and nine-tenths body fuel. This fuel represents sun energy. The leaves of plants capture the sun energy and transform it into food energy—starch and sugar. Why not utilize to better advantage our greatest reservoir of sun energy—the tropics—in the production of food energy? That is what we have learned to do in the banana crop. A banana is a pure-food package of bottled sunlight, captured by the broad leaves of the banana plant.

Regarding the first use of the banana for food and the first efforts to improve the native species, nothing is known. The reader can take for what it is worth the suggestion that the botanical names of two species of banana, *Musa paradisica* and *Musa sapicntium* (Fruit of Paradise, and Fruit of Knowledge), seem to point to a former tradition that this fruit was present in the Garden of Eden.

The banana plant may have been indigenous to both Asia and Africa. At least it was familiar in ancient India, and the monuments give evidence that it was known to the Assyrians and the Egyptians. But in those far-off days of slow transportation the banana never found its way far outside of the tropical regions. It was not used by the Greeks in Europe; and though the luxurious tables of imperial Rome requisitioned delicacies from the most distant lands, they never had the banana. As to the origin of the banana in the New World, there is a difference of opinion. Introduced by the Spaniards into the island of San Domingo in the sixteenth century, it spread rapidly to other islands and the mainland of Mexico, Central America and South America. But there seems to be a native tradition, widely spread, to the effect that there were at least two species of banana in America before the coming of the white man. And the fact that the various native languages have names for the fruit which bear no relation to the European name is confirmatory evidence.



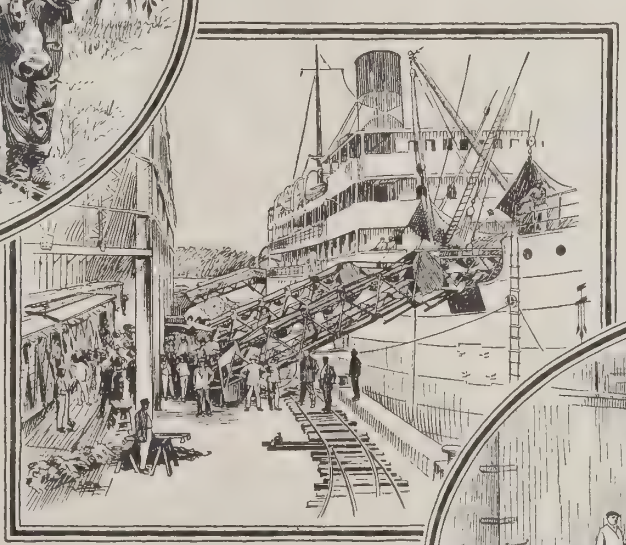
Hauling bananas by ox team from the plantation.

No part of Continental United States is well adapted for raising bananas, and with the possible exception of the Pacific Coast, this country was practically unacquainted with the banana half a century ago. At the first, a few bunches were brought to seaport cities on schooners. In 1872, the first shipment of 250 bunches of bananas entered New Orleans, and for a few years the banana trade was small and fluctuating. Some time in the eighties steamers replaced schooners in carrying bananas. Since that time the banana business has been thoroughly organized into a system which embraces the growing, transportation and distribution of this valuable fruit—a huge business, spread over a vast territory, drawing its supplies from all around the Caribbean region and the Hawaiian Islands, and reaching every section of this country.

Of the 60-odd known species of banana, four are of commercial importance. The common banana that is found in our markets, *Musa sapientium,* is characterized by its fine flavor, and its excellent shipping qualities. *Musa cavendishi* is the principal banana of the Canary Islands (used largely in Great Britain) and of China. *Musa acuminata* is used largely in the East Indies and the Malay Archipelago. *Musa paradisica* is not a banana, but the plantain, a related starchy fruit which is cooked and eaten as we might eat a potato. It is not considered a fruit.

For favorable growth, the banana requires a warm climate free from all danger of frost, and an abundance of moisture. Owing to the comparative lack of moisture, some tropical locations selected for the raising of bananas have been given up and put to other crops. The banana is an important export from several of the Central American republics, Panama, Colombia and Jamaica. Mexico and Cuba also have a considerable export trade.

The banana grows, not on a tree, but on a fleshy plant which develops one bunch of bananas, and is then cut down to the ground. The banana plant may be compared to our common garden canna, but is much larger, sometimes reaching a height of 40 feet, and a diameter of 18 inches. Like the canna, it has a rootstock, which is the real stem of the plant, from which the leaves are developed. What appears to be the trunk of the "tree" is composed of the bases of the different leaves which have come out of the rootstock, and which are wrapped onion-like around a common center. The leaf differs from the canna leaf in its great size, from eight to twelve feet long and as much as two feet wide, and in the fact that the veins run crosswise from the midrib instead of lengthwise. The action of the winds often breaks up the leaves into fine ribbons, as will be noted in some of the accompanying illustrations.



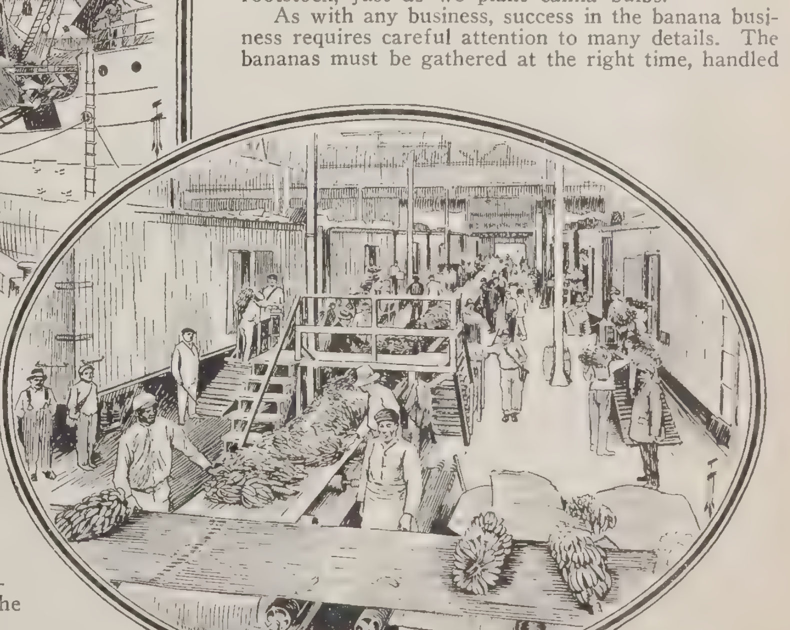
Arrival at the port. Loading aboard steamship continues day and night until completed, cargoes of 75,000 bunches being loaded in from 12 to 15 hours.

In establishing a banana plantation in Central America, it is the practice in some places to clear away the undergrowth in the virgin forest, mark out the rows, and plant the pieces of rootstock, and then cut the trees, which, in this warm, humid climate, soon decay and add to the richness of the soil. Cultivation consists largely in keeping down the wild growth and preventing the inroads of the banana gopher. This is no small task.

In favorable climates the banana grows very rapidly, attaining in a few weeks a height of six or eight feet, with a widespreading top. In a few more weeks, the plant is fully matured, the leaves cease to grow, and from the rootstock there springs up through the center of the plant a shoot bearing on its tip a blossom. This develops into a long spike with a large number of flower clusters, each cluster being protected by a bract. Only the upper of these clusters—from six to fifteen or more—are fertilized; the others wither away. Each cluster later forms one of the hands of bananas. As the spike has bent over with its own weight, it hangs reversed to the position it usually occupies in the stores, the individual bananas growing upward instead of downward, as one would naturally imagine.

Something like a year after the formation of the blossom, the fruit is ready for cutting. Thus a bunch of bananas requires more than a year to develop after the plant first appears above the ground. After the fruit has been removed, the plant is cut down to the ground to make room for the next shoot. The rootstock being a perennial, the old plant is succeeded by another, and this will continue for a number of years, after which it is more profitable to break new ground. The edible banana being a seedless fruit, all propagation is by means of pieces of rootstock, just as we plant canna bulbs.

As with any business, success in the banana business requires careful attention to many details. The bananas must be gathered at the right time, handled without bruising, kept at a low temperature during transportation, and reach their destination within two weeks of the time they are gathered. The gathering of millions of bananas, a very perishable fruit, in widely scattered plantations, and delivering them to the cities, towns and hamlets all over this country in a marketable condition, and without serious loss, necessitates the development of a highly trained, well-equipped and efficient organization.



Horizontal conveyors working in conjunction with unloading machines (New Orleans).

Bananas can be made to mature at all seasons; and large plantations are divided into zones so timed as to their maturity that the process of harvesting may be continuous.

The bunches must be cut from the plant while they are still as green as grass, and "as hard as a nail," and

Flower bud as it emerges at top of "trunk." After emerging, but just before bracts have fallen. Bud a few days after bracts have fallen. Bunch with all bracts off, showing fingers starting upward.

Advertising Did It!

Climate, Oranges, a Little Climate, Missions, Incomparable Climate, Movies, and Oh, Yes! Our Climate! And What's the Result? Right!

By PAUL DERESCO AUGSBURG

The "Robin Hood" set at Hollywood.

Los Angeles' aqueduct delivers 265,000,000 gallons of water daily and furnishes cheap electric power.

Plaza church, where Los Angeles was founded.

TAKE a flock of climate, a few good-looking oranges, a sleepy pueblo of old Mission days, a Chamber of Commerce and a large quantity of advertising; stir 'em up well and add more advertising; throw in some oil wells and a lot of ballyhoo; then add a harbor and equal parts of advertising; let the mixture boil a few years and then put in a $23,000,000 aqueduct and several million agates of press agent holler; add the movies and a half-dozen "high class" murders and some more ballyhoo—and what do you get?

The answer is Los Angeles, the Topsy of all the cities, the horn-tootingest town in the world, the municipality which advertised itself into a population of 775,000*.

"We just can't help it," they tell you at the Chamber of Commerce. "There's no stopping Los Angeles now, what with its wonderful harbor and its industrial future and its climate and its—well, everything. In 1925 there'll be 1,000,000 inhabitants within the city limits. And it's only a question of time before New York and Chicago will be the only larger towns in this country."

More ballyhoo chatter? Afraid not. As a human being who was brought up in the San Francisco region, possessing all the traditional dislike for Los Angeles that goes with such a rearing, this writer would like nothing better than to stand up on his hind legs and cry, "Bunk!" But if he did so he would be talking that very thing—bunk—and the Southern Californians would only grin amusedly and mention something about sour grapes. So all one can do is give the devil his due and reserve the personal right of hating this wonder town of the Southwest.

For it *is* a wonder town—wonderful because it had no business to grow up into a city at all. Just contemplate the municipal brat as it lay in its cradle, some five or six generations ago. It is 1781, and the soldiers have just marched over from San Gabriel Mission with the standard of Spain at their head. There are a few choristers and musicians, carrying a cross and a candlestick and other implements of the church, and with them is a priest.

The latter says mass. The soldiers, bored and blasé, shoot their muskets in a perfunctory salute. Governor de Neva makes a speech. Then the entire procession, marching once around the plaza, heads back to San Gabriel; and thus was founded the Pueblo de Nuestra Senora La Reina de Los Angeles—the City of Our Lady the Queen of the Angels—since contracted by general usage and California charter and the space limitations of our postmarks to Los Angeles.

It wasn't much of a birth for a town that expects to be No. 3 on the country's population list. A small conglomeration of Indians, Negroes, whites and half-breeds comprised the citizenry, and not one of them could read or write. Their sole notion of advertising was to hang their spare shirt on a willow limb to advertise to the neighbors that they owned more than one such garment. And to lean against the trunk of the same tree—with the other shirt on—to verify the fact.

But that, of course, was before the Chamber of Commerce came along. It was founded in 1888—more than a century later—when the erstwhile pueblo had achieved about 50,000 inhabitants. The earlier discovery of gold and the land boom of '87, with Chicago real estate men conspiring with the railroads to sting unwary settlers, had accomplished this population growth. For a time the trains brought homeseekers from the Middle West at a dollar a head.

Then the boom days began to die. The land was good for farming, to be sure, and the view of brown hills beyond the mesa, with the Sierra Madre rising far in the distance, was soothing to look at; but 50 000 people seemed about the limit. After all, why should a town grow larger when it was situated on a dinkey creek called a river, with a harbor 25 miles away? To this day no one seems to know any good reason for Los Angeles growing where it did.

"There *is* less wind velocity in this particular section of the landscapes," some Angelenos will tell you in a lame effort at explanation, but that's about the best they can do.

The Chamber of Commerce was started in a frantic effort to keep the boom from waning. In desperation its founders looked about for something to propagandate over, and in the midst of that look they glimpsed a magic word: climate. It was seized with avidity. It was crooned over, hoorahed over, prayed over.

"It's about all we've got—that and the orchard land—but we'll make all the noise we can about it," said the discoverers. Little did they realize that this small word, elaborated and illustrated and eulogized and super-press agented, would be hurled at the world in thousands of magazines and newspapers and pamphlets and what not until both hemispheres accepted as a settled fact that climate is the exclusive property of Los Angeles and environs. It's still among the most cherished of the Chamber's sacred cows, although now there is such a lot of other things to ballyhoo about.

But back in '88 the Chamber of Commerce had only two tunes to play. Frankly acknowledging that Los Angeles possessed no industrial future, the boosters concentrated upon tourists and farmers. The former were lured with pictures of a snowless, flawless winter climate; the latter found enticement in statistics anent oranges and lemons and how they loved to grow in Southern California.

"The founders of the Chamber did a startling thing that first year," declared Morris Rathbun, who is now manager of its extensive publicity department. "They ordered 10 000 booklets describing the glories of our region. Think of it! Ten thousand booklets! Why, that's just about a day's supply now."

It was in this first year that Frank Wiggins entered the Chamber. Like many another Angeleno, he had been sent out from the Middle West to die. This he refused to consummate, however, preferring to stick around and inhale the climate. Meanwhile, he had an idea of visual advertising which he wanted to try on the tourists—an idea that is now immortalized in every dusty Chamber of Commerce throughout the nation.

"You're shouting about your big oranges and cabbages and other stuff," said Wiggins. "Why not get an exhibit together and show these tourists just how big they *do* grow? When they see actual samples of what our soil and sunshine can do they'll begin to get interested."

So Wiggins was given the job of driving about the countryside and corraling every husky specimen of agricultural product that he could spy. He became a citrus sleuth, gumshoeing from orchard to orchard and bearding the mammoth orange in its den. The result was even more far-reaching than Wiggins had foreseen. The state and the railroads became interested in the idea, and joined hands in financing the first exhibition train ever organized. It invaded the East, proclaiming from railroad sidings everywhere the glory that was California, the grandeur that was Climate.

Each county had been allotted a certain amount of space on this train. Some—notably the northern counties—lost interest. It was too much bother to maintain the exhibits. Besides, they weren't doing any good, anyway.

The mournful smile of an undertaker who has just discovered an extra corpse in the ruins began to play upon the face of Wiggins. He lurked around a wilting exhibit, ready the instant some laggard county relinquished its space to take possession in the name of Southern California. In time the train was almost exclusively climatic in representation. The result, of course, was a steadily growing stream of Los Angeles-bound tourists.

All of which enraged the state legislature, which was a strictly northern body. It viewed with anguish the crowd of deluded easterners who rushed to Southern California and it neglected to renew its appropriation for train money. The jealous feud between San Francisco and Los Angeles dates from that time.

Soon came the announcement of the World's Fair at Chicago. Wiggins, the demon booster, began to rub his hands in glee and utter triumphant chortlings.

"Here's our chance to get before millions," he gurgled and set to work preparing the California exhibit. Samples of everything but the climate were conveyed to Chicago, and there were pictures of that. It was a little too early for the bathing beach beauty basking on the beach in February, but photographs of oranges blooming when the east was snow-bound served the purpose pretty well in those non-flapper days. Wiggins hasn't missed an opportunity to exhibit Southern California ever since that World's Fair year. He's secretary of the Chamber now and still yelling like a circus barker.

With the discovery of petroleum the Chamber of Commerce became busier than ever. The organization concentrated its efforts upon good roads, a harbor and an aqueduct. The twentieth century was well on its way; the Panama Canal was nearing completion. Los Angeles eyed askance the fine bays which were San Diego's and San Francisco's and began to curse the Spanish founders who placed their city so far from the ocean. A harbor must be had at any cost.

"Well, there's San Pedro sleeping down by the beach," suggested the Chamber of Commerce. "If worst comes to worst we can sneak down there some dark night and take its harbor away from it."

Worst failed to come to worst, however. The towns of San Pedro and Wilmington listened to reason. They saw that the harbor at their feet was too big for them to handle, and so in 1906 they consolidated with Los Angeles. The Queen of the Angels tied these two to her apron strings by means of a narrow strip of land, known as the "shoestring," and straightway proceeded to lay traps for commerce. The region is now known in the local papers as the Los Angeles Harbor District, and it's a capital offense to allude to it in any other terms. San Pedro is like Rogers Park in relation to

---

*According to latest estimate based on school census.

Chicago, or like the Bronx to New York, or like Jonah to the whale. It's been swallowed whole, and Los Angeles is doing a lot of spouting about its comparatively new harbor.

So much for the sudden transformation into a "seaport." There was still another water problem to be solved, for, while the salt aqua of the species had been finally taken care of, Los Angeles needed lots of the fresh variety. It took $23,000,000 of the city's money to turn the trick. Owens River water has to travel 250 miles, proceeding by tunnel, by aqueduct and by open ditch, before it reaches the chosen city. Incidentally it has washed in several hundred square miles of new territory and given cheap municipal electric power.

In 1914 Los Angeles was tenth in population but ranked twenty-sixth in factories.

"We'll have to inform the world some more," said the Chamber. "We'll start an industrial department and give it a nice big megaphone of its own."

The new department immediately instituted a survey of the local situation. Instead of raising its voice in a general holler of "Come on to our town; the prospects are won-n-nderful," it made a scientific analysis of what was needed. It found, for instance, that a large rubber corporation was shipping $12,000,000 worth of tires to the Pacific Coast each year; that a shoe concern was sending footgear worth $6,000,000 from its factories in the East. Why not manufacture these products in Los Angeles, thus eliminating freight charges and giving thousands of workmen the benefit of fresh-made climate? The suggestions sounded good. The factories were built.

Thus we find oil and water, with the attendant cheap electrical power, making Los Angeles a city of factories. But the water did even more; it made this town cover a greater area, according to the Chamber's claims, than any other city in the world. A shrewd stipulation in the aqueduct charter was responsible for this.

The charter provided that, inasmuch as the great Owens River project was being paid for by Los Angeles, not one drop of water could be purchased outside the city limits. Surrounding towns looked thirstily at the rushing mountain liquid and yearned vainly for a drink. The San Fernando Valley, through which the huge pipes passed, cried for water to irrigate its fertile ranches.

"Aw, let us have some," was the plea.

"Can't do it. You're not part of Los Angeles," came the answer.

Airplane view of central portion of Los Angeles harbor; part of the Pacific Fleet is at anchor in the outer harbor. East basin and connecting channels extend two miles to left of portion shown in this picture. West basin extends one mile to the right of portion shown.

Then the rush began. Hollywood and other near-by communities had foreseen the benefit of annexation even before the water project was completed, and they crawled in under the city limits rope only a few years after Wilmington and San Pedro entered with their harbor. In 1915 no less than 168 square miles of the San Fernando Valley became part of Los Angeles in one fell swoop.

"Come on in; the water's fine!" was the shout, and the little towns are still voting themselves in. The result is a strange, amorphous municipality spread over an area of 365 square miles. To go from one section to another you ride through a mountain pass. One of the city policemen travels a beat which takes him a week or so to traverse; if a murder occurs the day after he passes a certain point, the corpse is an Egyptian relic by the time the copper finally comes around to it. What is said to be the largest olive orchard in the world—1,500 acres in area—is within the city limits.

Now bear in mind that all these square miles are peopled with nothing but boosters. The virus ballyhoous is in their veins. They've been psyched into a hoorah frame of mind which knows no scoffing. With the Chamber of Commerce and the newspapers and the railroads leading the band and everybody else joining in the chorus, your Angeleno involuntarily loses the inalienable right of every human being to be a crab. He finds himself performing with the rest of the trained citizenry in the rendition of that immortal song:

"Adam lost his Eden, but we found it over here."

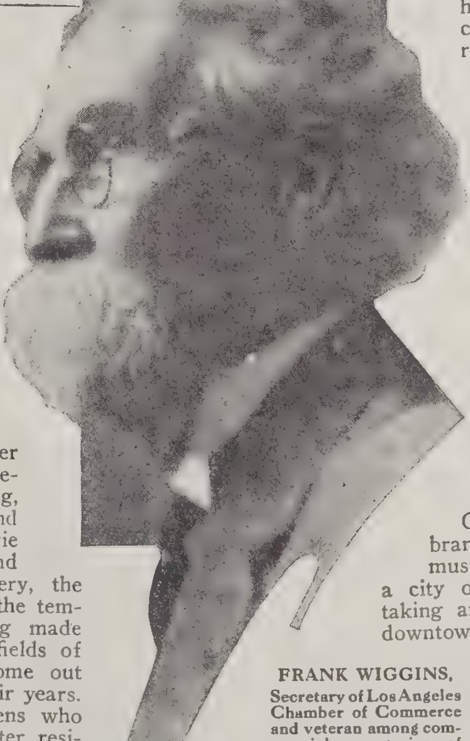
The result is a perennial hegira to Los Angeles. Paris has lost its lure. "See Los and die," is the slogan of the world. Half a million tourists throng annually to the metropolis of the coast, impelled apparently with the idea that there lies concentrated all the glamour of the Golden West. And advertising has done it!

The films have helped a lot, of course. Besides giving to Los Angeles its greatest industry, they are casting a magic spell over the city. Mary Pickford and her agile consort, Gloria Swanson, Chaplin, Tom Meighan, Viola Dana and the rest intrigue Mr. Average Guy's fancy more than President Harding, Babe Ruth, "Uncle Joe" Cannon, Harold F. McCormick and all the other newspaper immortals you can name. He and his wife and daughter want to gaze enraptured at the highboard fences which surround the studios; they must poke their heads into iniquitous Laurel Canyon and see the lodges where the celluloid heroes hold their orgies; they want to drink in the view of Doug's and Mary's home; they haunt the beaches where bathing gals are supposed to strut their stuff. Your orthodox tourist's first move, after registering at a hotel, is to hotfoot it for Hollywood. Later he may, if he has time, journey out to San Gabriel Mission and contemplate the quiet little structure from which marched the founders of Los Angeles.

The San Gabriel Mission, founded in 1771, called "Queen of the Missions" on account of its beautiful architecture.

With all these Lorelei props—the climate, the movies, the pictures of palm trees and bathing beaches—it would seem that God had been good enough to His, as the Chamber of Commerce would say, chosen city. But no! As if Los Angeles had not received more than its share of publicity, along came a flock of "high class" murders and scandals to cinch its claim to fame. The Kennedy slaying, with its subsequent series of mistrials; the "Fatty" Arbuckle case; the unsolved Taylor murder, strongly spiced with cinematic naughtiness; the "love killing" of one woman by another, a hammer being the medium of extinction—all of these interesting affairs, crowding with numerous lesser cases into the space of 12 brief months, have elevated Los Angeles to the status of a "hot" news center and inspired a large middle-western paper to establish one of its stars as a permanent correspondent there. True, the Arbuckle case belongs to San Francisco, but "Fatty" belongs to the movies and the movies belong to Los Angeles and Los Angeles reaps the glory.

And so the tourists stream in, some to remain and form part of the 15 per cent population increase which has been recorded each year of late. This flapper city, so uninterestingly new despite its ancient Spanish founding, seems to appeal to the eastern and middle-western taste. Prairie farmers and business men find contentment in the hilly scenery, the smooth and dustless highways, the temperate atmosphere; and, having made their little fortune in the cornfields of the Mississippi Valley, they come out here to enjoy the balance of their years. Then there are wealthier citizens who build handsome homes for winter residence. Many of the country's best-known writers have also answered the siren call of the Chamber of Commerce and its confederates.



FRANK WIGGINS,
Secretary of Los Angeles Chamber of Commerce and veteran among commercial secretaries of the country.

Why they like the town is a mystery. Save for the old plaza, where stupid-eyed Mexicans foregather and gaze across the street at the secretive precincts of Chinatown, there is nothing picturesque about Los Angeles. Here is its only kinship with the glamour that is San Francisco's and New Orleans', with the romantic halflights that are found in Lower Manhattan and in the near-north side of Chicago.

Yes, Los Angeles is too clean and precise to be interesting. All its streets are perfectly paved. Its homes are beautiful, stretching in mile upon mile of boresomely unending pulchritude. Unique architecture is rampant. A typically Angelesian arrangement, reminiscent in a way of the flat dwellings of the East, is seen in the bungalow courts. These consist of two rows of tiny, one-story homes, all facing a mutual sidewalk and garden. At the end of the walk, farthest from the street, sits a larger house, for all the world like a papa watching his kids. Hollywood is particularly epidemicked with these dwellings.

Last year more than 17,000 homes were built within the city limits—the major part of a constructive offensive totaling nearly $108,000,000 in value. Tracts are being opened up everywhere. Middle-aged women, acting as steerers for the real estate sharks, accost you on Hill street with free tickets for a dozen sight-seeing rides.

"There's absolutely no obligation," they tell those who tarry at their solicitation. Then the non-obligated one learns how he is to be shown the old plaza and Pasadena's "millionaire row"; how he is to get a view of the orange country and have a wonderful boat ride; how he is to receive a "ranch dinner" and a lecture on homesites—all free, absolutely free." All he need do is step into the waiting rubberneck as the real estator's non-obligated guest. One promotor not only gives a radio concert and a "monster barbecue" at his Sunday lot-selling fiesta, but his full-page "ad" tells of a Ford to be raffled off among those present.

"Just a big, good looking, overgrown village—that's Los Angeles," is the frequent comment about our coming third city. Certainly it lacks the metropolitan air, despite its great industry and size. So rapidly has the city grown, indeed, that it has been unable to keep up with itself.

Consider, for example, the public library. How mortified Mr. Carnegie must feel when he looks down to see a city of three-quarter million inhabitants taking an elevator to the top stories of a downtown office building to borrow books! The city hall, sandwiched between a confectionery establishment and a cut-glass store, is lost in the middle of a Broadway block, pathetically inconspicuous in comparison with that movie theater a few rods down the street. The sewage-disposal system was built 25 years ago for a city of less than 100,000. The schools are so overcrowded that last term there were three pupils for every two desks, and a special educational bond issue of $17,500,000 had to be voted. The phone service is awful. Why, there isn't even a public morgue to house the "high class" murder victims!

Particularly flagrant, however, is the street car "service" and the sluggishness of traffic in the business district. Cars, perpetually jammed with Angelenos and tourists, poke along in a manner most ruinous to the mental poise. They turn corners, ramble a few blocks, turn another corner and then waltz around some more, until the motorman's head is in a whirl. "A street car never knows where it's going to end up at in Los Angeles," is a wheeze they pull in vaudeville.

The Flexible Tariff Invites Graft Lobby

When Is a Lobbyist Not a Lobbyist? Are Not Members and Senators Supposed to Be Lobbyists for the People?

By TOM EVERRITT

A LOBBYIST, who has plied his trade in Washington since the early days of the tariff bill that recently became a law of the land, lately had this to say to one of my friends: "Two months ago my mind was made up to leave Washington immediately upon the tariff bill becoming a law; but the special provision in the act giving the President authority to raise or lower any rate in the bill not to exceed 50 per cent of the rate carried in the bill, and to apply the American valuation plan, opens up such a rich field that I have decided to remain indefinitely."

He advised my friend to get busy and make a few connections with interested concerns in the United States, and go into the lobbying business, assuring him that the years during which the tariff act will be in effect will be the richest and most fruitful in the history of tariff lobbying at the national capital.

But it probably will not be so easy as that, for tariff lobbying has changed from the coarse methods of a decade ago, when whisky and wine, dinners and dollars, and women and witchery brought home the bacon for the lobbyists. Those old, raw and disreputable days are past.

Tariff lobbying is now one of the fine arts, except that none of the other fine arts is quite so lucrative.

The "flexible" tariff arrangement places decisions as to increases or decreases in rates in the hands of the Federal Tariff Commission and the President of the United States, and they will be subjected to the wiles, smiles, importunities and arguments of the lobbyists, and this situation will require a smoother and more expert individual to deal with them than with Senators and Representatives "on the hill."

We'll See Permanent Lobby

IT WILL not be a very wholesome spectacle—this thing of a flock of lobbyists soliciting the President and the Federal Tariff Commission, for it may be expected that additional swarms of specialists and experts in various chemical, industrial and other lines will be found permanently camped in Washington after the Fordney-McCumber tariff act shall have gotten into full operation, as the "flexible" provision in that act opens up possibilities hitherto undreamed of.

It may be of interest to attempt to learn just what a lobbyist is and what lobbying is, and in the pursuit of this information let us go back to 1913, when the Underwood Tariff Bill was being considered, and when exhaustive hearings were had before the Senate Judiciary Committee on the "Maintenance of a lobby to influence legislation," Sixty-third Congress, First Session.

Every member of the United States Senate at that time appeared before the committee, and each was subjected to a set of questions in the form of a printed questionnaire. One of the questions was as follows: "What do you mean by the words 'lobby' and 'lobbying'?"

These Senators were men of experience, and it will be interesting to know how some of them, who are, with two exceptions, in the present Senate, defined the subject. Let us take them in alphabetical order.

Senator Ashurst, Democrat, of Arizona, said: "A lobbyist, I consider, is a man who attempts to influence the action of a member of Congress by means other than a printed or written argument or appearing before a committee of Congress. If a man wishes to urge a measure, he should go before a committee. The occasional lobbyist may come to Washington to do a definite job. The lobbyist who makes it his business to live in or stay about Washington for the purpose of influencing legislation, making his living in whole or in part, is the most odious.

"A lawyer or expert who comes here to represent a special interest upon a legitimate employment, where he uses no improper methods, uses only legitimate argument either before a committee or before individuals, is not a lobbyist."

Senator Borah's Definition

HE DIVIDED them into three distinct groups, the "occasional," the "professional" and the "legitimate."

Senator Borah, Progressive Republican, of Idaho, is much in the public eye at this time, and his definition should be of special interest. He said: "I suppose, in popular parlance, we mean by 'lobbyist,' a man who is employed, paid professionally to influence legislation concerning a matter, not because he is interested in the matter, not necessarily because he thinks it right, but because he desires to earn his salary, and is paid like a lawyer sometimes to argue a bad case, to do the best he can in the situation. That is my idea of a lobbyist."

Borah generally goes to the point clearly and succinctly, and he seems not to have deviated from that habit here.

Senator Brandegee, Old Guard Republican, has been in the Senate nearly 20 years, and probably has had considerable experience in various ways, so that his viewpoint ought to be worth something. It was this: "I think the word 'lobby' is a word that is rather loosely used. If no qualifying phrase or phrases are used, it would mean a retained, hired set of men who were soldiers of fortune and whose profession it was to try to influence legislation.

"But I think the word is frequently used to mean a man who is favoring a measure, or a man opposing a measure, who gets his friends to come down and interview legislators. I should call that a lobby, too, although not a paid one. I do not think there is any exact definition of it."

Brandegee seemed to lean to the idea that the old-fashioned legislative adventurer, whom he terms a "soldier of fortune," is still doing business around Washington. There are few of his sort left. He is almost defunct. He has been replaced by the more skilled manipulator—the specialist or expert.

One only has to scrutinize the directory of tenants of the office buildings in Washington to become convinced of the great change that has taken place in the business of lobbying. We find listed the "American Society" of this and of that; the "American Institute" of this and of that; the "National Association" of this and of that industry, besides a veritable army of individual lobbyists.

Thus has the old "soldier of fortune" given way to the highly organized group of specially trained men and women fitted to handle the legislative affairs of the particular industry in whatever way may seem best for the good of the cause.

Senator Cummins, erstwhile Progressive Republican, of Iowa, had this to say: "I observe that there is the widest difference of opinion about what a lobbyist is. I think that, no matter what the word formerly meant, no matter what its derivation might have been, a lobbyist, according to the public understanding now, is a disreputable creature, who is pursuing either an avocation or a method that the ethics of the people condemn. I think a lobbyist is one who attempts to influence legislation by other consideration than an appeal to reason, right or justice. There are thousands of ways in which these things can be done."

Let us leave the Senate for a moment and go over to the Department of the Interior. Honorable Albert B. Fall, Republican, of New Mexico, the present Secretary of that department, was in the Senate in 1913, and he said: "I have no information as to the use of money to maintain a so-called lobby. It is well known that certain industries have agents here in Washington and have had when tariff legislation was pending. I suppose, of course, those agents are paid a salary and have their expenses paid."

"Of the Past" Penrose

BY REASON of the authority vested in the President to change and alter any rate in the Fordney-McCumber tariff law, and to apply the American valuation plan, it is perfectly clear that no duty upon any article or class mentioned in the act can be said to be permanently fixed; therefore, it may well be said that the Fordney-McCumber tariff law will remain "pending" during its life. Thus, it would seem quite natural that the "agents" spoken of by Mr. Fall will have quite a lot of business in Washington for many months to come.

Senator Penrose, reactionary Republican, now dead, did not say a great deal about lobbying. It was not his habit to talk very much about anything. He could be most optimistic under very unfavorable circumstances. So, when Washington had out the "standing room only" sign for lobbyists, he said: "As far as the uncertain term 'lobbyist' is concerned, my own opinion is that the lobbyist is very largely an incident of the past." Which is terse and to the point and requires no explanation, especially when one knew the Penrosian mental slant.

Returning to the Senate, let us hear the opinion of Senator Lodge, standpat Republican, of Massachusetts, who was at that time minority leader in the Senate. It was as follows: "As to the meaning of the words 'lobby' and 'lobbying,' of course the words are very loosely used. I think that the word 'lobbyist' implies a person who frequents legislative bodies for the purpose of influencing legislation.

"It usually, I think, in the public mind, is associated with the idea of something improper. It may be improper or it may not," which would seem to be a fair proposition. No one can dispute that lobbying may be or may not be improper, just the same as no informed visitor to Washington can deny that lobbyists frequent our legislative bodies. If they would do nothing more than merely to "frequent" them, there would be no basis for this story.

Likened to Lawyers

THE venerable Senator Nelson, plain Republican, of Minnesota, who told me, some months back, that no man of his age—74 years—ought to be a member of the United States Senate, as the work required of a Senator these days calls for younger and more vigorous men, appears to put the Senate in the class of a court room, for he said: "In reference to the academic question, what is a lobby, or a lobbyist; in a broad sense anybody who comes here to advocate or oppose legislation is a lobbyist; but in the more pertinent and legitimate sense, I think a lobbyist occupies the same relation to legislation, tariff or any other legislation, that an attorney does to a lawsuit; that is, that he is hired in some way to come and appear and present that case.

"As a matter of fact, there is lobbying going on in matters connected with all legislation."

It was left to Senator LaFollette, Progressive Republican, of Wisconsin, to point out an actual case of improper lobbying, in which he recited that: "Four years ago, I was interviewed on the subject of hides and leather, and the interviewer informed me that he had already engaged a page or two of advertising space in the weekly magazine which I publish. I told him he should get to the telegraph office as quickly as possible and cancel that contract, and I would probably be in advance of him."

He then continued, giving his interpretation of lobbying, which was as follows: "The people who are here in very constant attendance upon the session are either expending a very large amount of money themselves or are being maintained here at the expenditure of goodly sums of money.

"To my mind, lobbying consists in influencing legislation by argument or otherwise. I think it is as much lobbying when those engaged in it are the owners of a business, as it is when made a business or profession.

"At the same time, I do believe that many times the very strongest influences that can be brought to bear upon legislation, and in some instances, the most pernicious influence that has been brought to bear upon legislation, either in state legislation or congressional legislation, has been exerted directly by owners of the business."

"Lobbyists and Lobbyists"

SENATOR LAFOLLETTE makes clear the relationship of the owner of the business or enterprise to the game of lobbying. The professionals are employed by, and receive pay from, somebody, and standing in the background of the picture is the manufacturer, producer or other business man, who does the hiring and who does the paying.

Senator Owen, Progressive Democrat, of Oklahoma, who possesses one of the keenest minds in the Senate, had this to say: "Some men mean by 'lobby' those who are engaged in a sinister effort to influence legislation by improper personal means, either by appeals to personal friendship against the general welfare, or to personal interest, direct or indirect, and in that sense, of course, the term 'lobbyist' is an offensive term and would mean a person who did not have a nice sense of honor.

"There are others who use the term 'lobbyists' to mean simply any persons who are engaged in discussing questions before Congress . . . . I believe the great interests of the country, in some cases, have men employed on a wholesale plan, systematically to persuade public opinion against the truth, against the actual facts, by a false statement of fact, by fictitious reasoning to persuade public opinion against the interest of the public in favor of their own private interests."

Senator Owen had in mind, no doubt, when he spoke of men being employed on a wholesale plan to persuade public opinion against the truth, the tremendous volume of propaganda of various kinds issued from Washington, for nearly all the associations and organizations of different industrial and other groups have their Washington publicity bureaus.

I have given what may be considered an assortment of thought selected from eminent senatorial minds, and with this symposium of views of these men of both political parties, who evidently have had many kinds of actual experience, it is easy to form the composite idea that there is considerable importance to be attached to this thing of the "lobby."

"On to Washington," the Cry

SO, DURING the coming days, in the administering of the Fordney-McCumber tariff law, we well may expect such a steady growth of the art of "lobbying" by paid "lobbyists," that it will assume such proportions and so firmly intrench itself in official circles that it will become an accepted part of the machinery of government at Washington.

Frequently, it is heard in Washington that this Fordney-McCumber tariff measure, declared by many thoughtful men to be an economic crime, with the special provision for raising or lowering tariff duties, may be used as an instrument for extracting Republican campaign funds from the purses of those interested in obtaining higher or lower tariffs; but it is not believed the chief executive of our nation will lend himself to anything of the kind.

But, if only a small part of the dire results prophesied take place, then there will be an open field for those who, as Senator Borah puts it, are "employed, paid professionally to influence legislation," and it is certainly now believed by those who are familiar with the methods of the "insiders" in Washington, that a veritable horde of professional, unprofessional, special and other uncataloged lobbyists are horsing themselves in battle array in a country-wide "on to Washington" movement, where the results of their sordid activities will be kept under such a cover of secrecy that the public will never know how or when it is being trimmed by these men, the most of whom are cunningly plotting constantly and everlastingly against the welfare of the people in behalf of their own personal gains.

Making Shady Roads for Future Generations

How Minnesota Is Lining 7,000 Miles of Highways With Trees

By EARL CHRISTMAS

IF YOUNG lovers of the future do not take to the air for their summer joy rides, they will find ideal conditions for romance by driving along the highways of Minnesota. Long, smooth stretches of road, shady lanes and stately trees—all will be there. Minnesota is building a 7,000-mile state trunk highway system, and is lining the roads with trees.

"A state of tree-lined highways"—such is the goal of W. T. Cox, state forester, who has set out to prepare Minnesota for this rather pleasant distinction. During the past year, with the co-operation of the State Highway Department and interested citizens, he has planted 30,000 trees along the highways of Minnesota. But that's only a start. As quickly as possible, he is to plant trees along all the 7,000 miles of the state trunk highway system. It will take some years to finish the job, and require many thousands of trees. After that he hopes to extend the work to all the local and connecting roads. Every highway in Minnesota lined with trees—that is the ultimate goal.

Consider the prospect, a paved or graveled road through a continuous lane of trees. Sounds inviting, doesn't it? So it did last spring when Mr. Cox launched his campaign. Civic and commercial organizations were quick to join in the movement. So were the municipalities. The Boy Scouts and members of the American Legion enthusiastically took up tree planting.

All Mr. Cox and his assistants had to do was to furnish the trees. He found everybody ready to put them out. In fact, he couldn't begin to supply the demand.

Because of this co-operation and partly because of a fortunate purchase, planting one of those trees at the side of a Minnesota road cost the state just a little more than two cents. For $678, it planted trees along more than 100 miles of highways, and retained a generous number for replacements next year.

Now, there's a valuable lesson in that, not only for Minnesota, but for other states. It suggests a most effective way of making our highways attractive, almost without cost, and at the same time it constitutes a splendid illustration of reforestation, now so much needed in this country.

Suppose we look into the future a bit, and see what we may expect from that $678. In the highway planting in Minnesota this year, black walnut was used. Later, other varieties of trees are to be planted, depending upon conditions in the localities where the planting is done. But the first year's work was confined to black walnut trees, which were set out in Southern Minnesota.

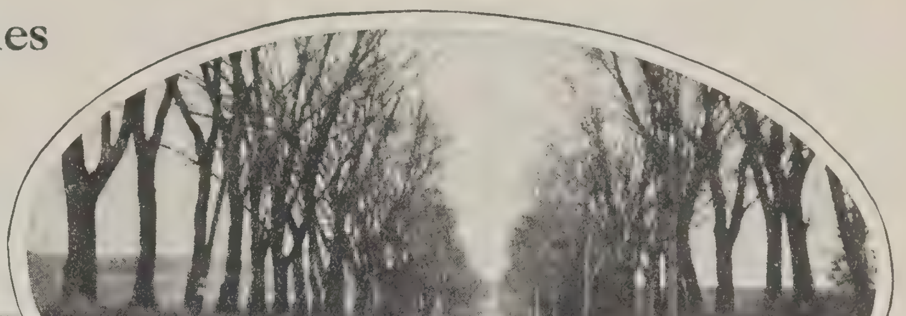
In 20 or 30 years, these highways will be lined with fine, big trees. For that $678, the state will have more than 100 miles of roads bordered with attractive trees. Nor will the improvement be of passing moment. The walnut trees will live from 150 to 200 years, according to Mr. Cox. The other varieties selected for highway planting likewise are long lived. Thus, one of these two-cent trees will go on shedding its benefits upon succeeding generations. Indeed, lining highways with trees makes a very impressive monument for the future.

P. O. Anderson, silviculturist of the Minnesota Forest Service, put the case this way:

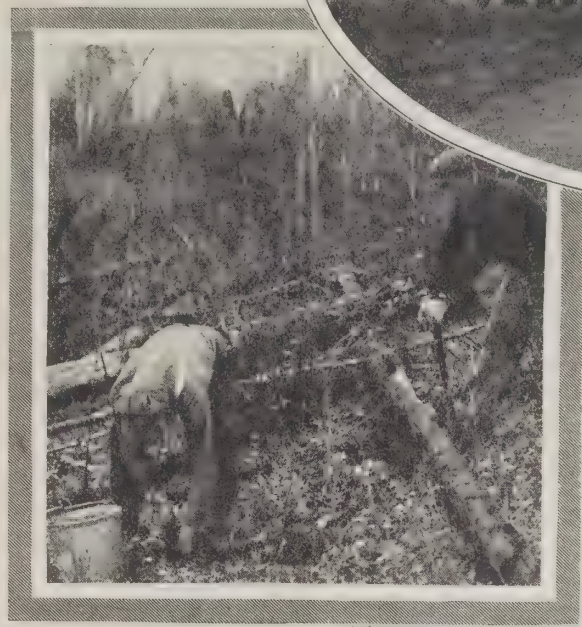
"Trees along the roadside protect the traveler from the direct glare of the sun and the hot, dry winds of summer. A journey through a region barren of tree growth over a hot, dry, dusty road will soon convince anyone that roadside planting is almost as necessary as road improvement. It increases the value of the state as soon as such a planting is started, and it continues to increase it yearly as the trees grow. The people are beginning to appreciate this. I have known road commissioners even to leave individual trees in the center of the road, and no interference with traffic has resulted."

But beautification of the roads, desirable as that may be, is not the only idea back of the movement. Providing for the comfort of the future traveler is something. Raising walnuts for him may be of some moment. But there is something else back of the program.

"We want to make the roads attractive," Mr. Cox said. "But in addition to that, we want to encourage people generally to plant trees. Every man who plants a tree becomes a friend of forestry in other lines, and right now we cannot have too many people interested in planting trees. We must plant more trees. We should have more trees on the farms, and there are vast areas of cut-over timber lands that need to be reforested.

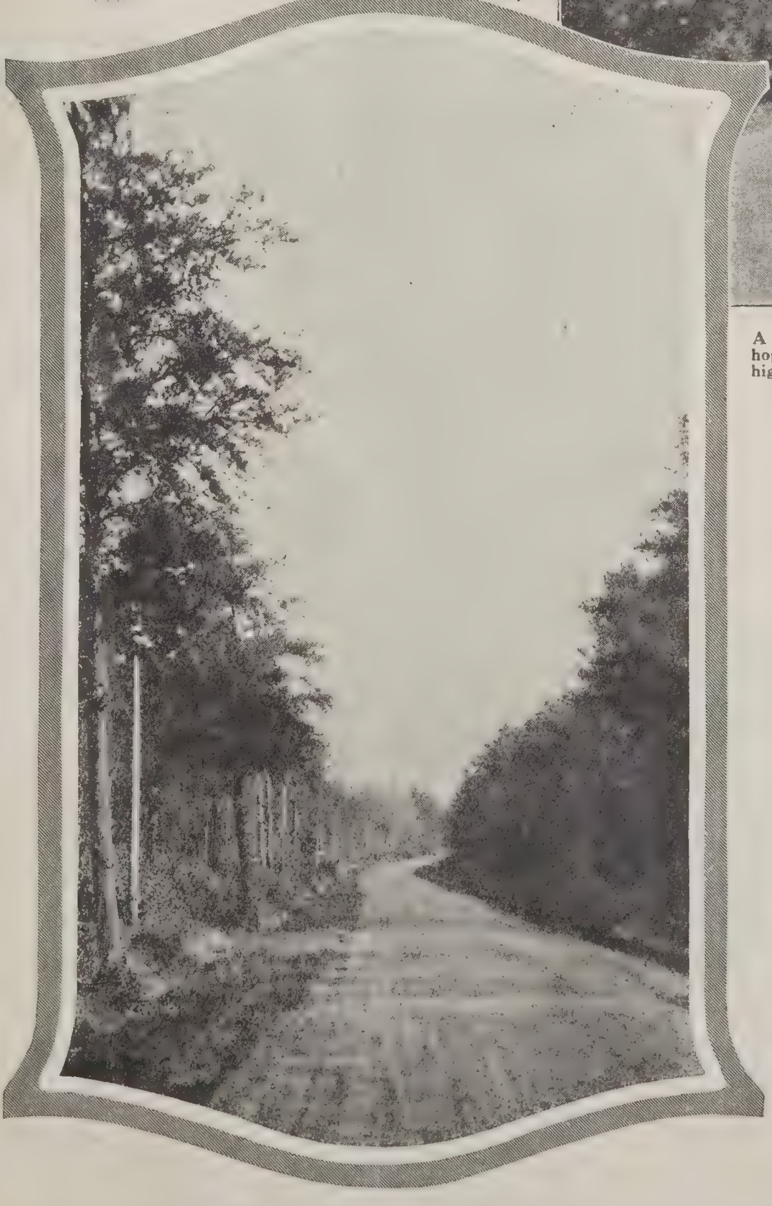


Winter scene along Highway No. 20, north of Rochester, Minn.



Many thousands of acres of cut-over lands are waiting for the tree-planting crews.

A tree-lined highway such as Minnesota hopes to develop from each road in its trunk highway system. This is the Dodd road leading into St. Paul.



St. Louis County, Minnesota, has carried on an extensive campaign to keep its highways green. It has taken steps to preserve the trees with which nature lined the roads, has planted many more and taken considerable pride in keeping the roadways clean. This is an example of what is being accomplished. Minnesota is starting out to line all its trunk highways with trees.

"Twenty years ago, Minnesota was at the top of the lumber-producing states. Now, it is sending out of the state $30,000,000 a year for timber products. We are hauling timber 1,000 to 2,000 miles from the West Coast or the South. Take Iowa, for example. Iowa pays $18 freight, a thousand feet, or something like that, to get its lumber from the coast, whereas, it might get it from Minnesota at $4 if we had it.

"Now, we can just as well raise all our own timber, and have some for export. If we stop the fires, adopt conservative methods of logging, and reforest, we can supply Iowa, Illinois and the Dakotas with great quantities of timber. For every $12 spent now in the planting of an acre of forest, there will be a saving in imports of approximately $1,200 for Minnesota in 40 years.

"Timber is being cut over and destroyed in Minnesota at the rate of 200,000 acres a year, while only 100,000 acres are being cleared. The original stands of old timber in the state are few and far between. At the present rate, it will be practically all cut over in 15 years or so. Unless more planting is done and the forests protected from fire, 20 years will see Minnesota practically eliminated as a lumber-producing state. The timber we have now is inadequate to stand the constant drain of eastern and middle-western consumption.

"So, you may see why we are so anxious to encourage the planting of trees in every way we can. Of course, we have great areas of young timber coming up, but many thousands of acres are barren because of improper logging or subsequent fires. Much of this cut-over land is unsuitable for farming, and should be reforested.

"We have wasted great areas of timber. This is true not only of Minnesota, but of nearly all states which once had great forests. We have allowed the forests to be logged clean, instead of preserving the young timber, and fires have destroyed big areas.

"It's time we did something definite to reforest these lands. We need to realize in this country that timber is a valuable crop. European countries have reforested lands that for centuries were regarded as untillable and only waste. There are forests in Europe that have been furnishing timber for hundreds of years, and they have just as many trees as in the beginning.

"Plant trees, plant trees—that's what we need to do! We want to get people in the habit. Every farm should have a woodlot. And then, there is the shelter belt.

"More and more, farmers are realizing the value of placing a shelter belt of dense and low-branched trees along the side of their fields. It increases the yield by reducing evaporation, beautifies the farm, aids in weed control, and provides a nesting place for birds that eat insects. This may affect the crop over a whole field of 40 acres. The crop is noticeably better in the lee of the growth. Evaporation increases with the square of the velocity of the wind."

The trees are set about 50 feet apart, being "staggered," or alternated. This gives opportunity for circulation of air, and the shade will not be dense enough to interfere with drying of the road.

Are We Flat-wheeling the Railway Post Office?

Charged That Administration Still Cherishes Burleson Tactics

By ROBERT KENTON

HOW many persons know the full significance of and appreciate the intricate services rendered them by that branch of our postal service which is known usually by the initials R. M. S.? The evolution of the R. F. D. system, by which about 75 per cent of all rural residents of the United States receive mail daily at the hands of carriers, is familiar to everyone. Even the average school child is well acquainted with the introduction of the airplane in long-distance mail carrying. But with all its immensity, the many tens of thousands of miles covered by the more than 40,000 carriers who daily traverse their routes, the rural free delivery branch of the mails renders services that in volume and difficulties are small when compared to those rendered by the Railway Mail Service.

Ninety per cent or more of all mail passes through the hands of the approximately 20,000 persons who man the R. M. S. They compose the one group of postal workers who are cut off almost entirely from direct contact with the general public. Rarely does the sender or recipient of a piece of mail see one. Though most of them are ever on the go, their work is as isolated as if it were done on a remote island of the sea inhabited by railway mail clerks alone.

It is because of their work that a letter dropped among thousands into a mail box, say, in New York early in the evening, is delivered to its addressee, say, in Washington, nearly 200 miles away, early next morning. To do that isn't merely collecting that letter along with thousands of others, putting it and them into bags and throwing the bags on fast trains. That alone would mean such confusion that the letter in question never would be delivered. With it are mailed letters destined for places north, east, west and south, with innumerable sub-deflections. With the short time the sorters in the New York post office or its branch stations have before the fast trains leave, all that can be done is to give that mail more or less general routing.

R. M. S. Neck of Bottle

THUS the letter in point would be put in a bag marked for trains going south, or, at best, in a bag marked merely Washington. If the first is done all the letters in the bag must be sorted on the train so that only those with Washington addresses may be thrown off upon the train's arrival at the capital. Likewise must those in bags coming down to New York from New England points for delivery southward be resorted. Even with the bag containing only Washington matter collected late in the day in New York, expedition requires that its contents be sorted in transit. For if thrown off in the shape received the night before, the clerks in the Washington post office would have to hold its contents for several hours, until the mail was so sorted that it might be correctly distributed among the hundreds of carriers operating through the various sections of the city. Therefore, as the train blazes a pathway through the night the railway mail clerks, standing among a small forest of gaping bags with curious pigeonholed boxes above them, must arrange the mail addressed to Washington in packages for the different carriers. Thus when the train reaches Washington, the mail for local delivery there may be thrown off in such shape that each carrier as he arrives for work will find all his route's mail segregated from all other, so that he immediately may arrange it in his bag and hie forth upon his rounds and put letters poured into the reservoir in New York on the evening before accurately on desks in Washington before 9 a. m.

The R. M. S. is the slender and narrow neck to the great bottle of the postal service. The mail must flow through that neck with such precision as will insure transport and delivery almost in perfect consonance with the means of movement—if perfect postal service is given. The mail has to be then poured through the neck so perfectly that it will come out in manifold streams which flow unimpeded in as many directions as the innumerable ones from which it came. And the eye and hand of the Railway Post Office Clerk make it possible for such to be done. Experienced clerks often have to know the post offices of several states, as they know their alphabet, and frequently know the layouts and addresses in detail of city routes on which they never put foot. It is not unusual for one to give specific direction to as many as 8,000 separate pieces of mail during a single night's tour of duty.

The railroads alone receive about $90,000,000 a year for the single item of transportation. About $40,000,000 additional is paid in salaries to the post office department employes who man that branch of the service. It was established in 1863. Prior to that year mail was transported on the railroads in bulk very much as common freight. Then came the crude rolling post offices of the early days. Ultimately there evolved the big 60-foot long mail cars, and smaller ones, equipped for carrying crews of from one to six or more clerks and equipment for the sorting and distributing that must be done in transit if mail congestion is avoided at terminals. The R. M. S. grew to the point where nearly all mail, especially that of any large volume, was distributed in detail on the trains, thus cutting to a minimum the time intervening between the mailing of an article and its final delivery. Then, in 1916, came the Burleson passion for postal economy. The chief point of attack was the Railway Mail Service. It is probable that wasteful and unnecessary practices had grown up in that branch of the postal system; certainly, the passing of time had rendered some of its customs antiquated. But the feeling for dispatch which marked its evolution still governed it.

Railway carriage of the mails was paid for until 1916 on a weight basis. This enabled those directing the R. M. S. to use as many trains as they needed, and generally as much space, without additional cost to the government. But in the year in question change was made to the space basis for payment. Thus a railroad collects for the number of cubic feet of car space used by the Post Office Department and not for the actual mail freight handled, or its character.

The space method of payment may be the more equitable system, but it made leeway for economies which many critics say are more apparent than real, and which, they also say, are achieved at undue cost to the total efficiency of the entire postal system.

The Burleson administration instituted a campaign to cut down space used on the trains. This meant, of course, fewer mail cars and fewer mail trains. It brought about the necessity for handling more mail as mere freight, that is, in closed pouches and even locked cars, which cut down the volume of distribution done on the trains. This, of course, shifted much distribution from the trains to the post offices, with a saving no doubt in its cost but with inevitably increased delay in delivering mail thus affected. There developed what are now important appurtenances of the Postal Service—the establishments known as terminal post offices. These are places set up at the railroad stations in important distributing centers for sorting and routing mail which arrives at them in bulk but must be resorted and rerouted to get through properly. The terminal post offices are stationary railway post offices. They save on railway car space and somewhat on clerk hire. But mail handled by them is delayed.

Mail Greatly Delayed

THE Burleson administration sought to limit such delayed mail to the less important classes. First-class mail, including daily newspapers, continued to be given mail-car distribution as before, or at least such was presumably the case. As a fact, it is charged, the rage for economy went so far that much first-class mail could not be distributed on the trains and was thus delayed at terminals or at delivering post offices.

There, of course, was much complaint from the public, as well as postal employes. One of the firmest pledges made by the present administration was that all of Burleson's allegedly false economies would be abandoned. In truth, for the first year or two of its life, a better spirit at least was generated within all branches of the Postal Service and public complaint on the score of inefficient handling of mail all but ceased.

Now, it appears, some phases of Burlesonism have been retained or revived. And, as during the administration of the former Postmaster General, the chief point of application seems to be the remote and, to the public, isolated R. M. S., the narrow neck which connects the gigantic collecting and distributing reservoirs of the Postal System.

The neck of the bottle again is being squeezed to smaller size. Since 1916 the total number of miles covered annually by Railway Post Office cars has been cut from 340,479,600 to 280,728,833. Most of that cutting was done by the Burleson administration but more than 4,000,000 miles reduction has been made since the present administration went into office.

Number of Clerks Cut

IN 1912 the number of clerks assigned to road duty, that is, on trains, was 15.328; today the number is about 14,000. It is estimated that the volume of mail has increased at least 75 per cent since 1912, and perhaps 50 per cent since 1916 when the slashes in the Railway Mail Service began to be made. Since 1912 the number of clerks assigned to terminal duty has increased from 448 to 3,058. These figures are supplied by H. W. Strickland, industrial secretary of the Railway Mail Association, which is the organization of the employes of the R. M. S. The meaning of those figures is that more and more mail, as far as rail transportation goes, is treated as mere bulk freight. The distributing is done while it is standing still, which means an extension of the time intervening between delivery to and final delivery by the Postal Service. In continuation of that Burleson policy the present administration recently cut the Railway Mail Service train forces about 350 in number and threatened to make it one thousand. Protest upon the part of the clerks, it has been charged, was followed by threats of repression similar to the kind which the Burleson administration was accused of employing.

"The mail cars that are operated today are usually so jammed full of mail that distribution is retarded," declares Secretary Strickland of the Railway Mail Association, which in only secondary sense is a union, in that it is a "no strike" organization. He declares that crews frequently have to leave undistributed at least 25 per cent of the mail which still is supposed to be handled for quick delivery on trains.

"The R. M. S. was once a prideful organization," says Mr. Strickland. "From the highest officials down to the newest 'sub' the effort always was to get the mail to destination by the quickest possible train. 'Schemes' of distribution and schedules of mail trains were the constant day-and-night companions of the men who 'worked' the mail while the trains ran. Under the system of weight pay for mail transportation any and all trains on all railroads were available. Fast mail, limited passenger and slow freight trains were used, according to the need of the service. The whole idea was to get mail 'home' at the earliest hour transportation facilities permitted.

"Under the space system the less numerous the trains the less the cost. If the people on a branch line had been getting mail from two trains a day and sending it out on an equal number, the Post Office Department could reduce the cost by carrying all the mail on one train in each direction, and such, in many cases, was ordered to be done. Where two or three or four trains in each direction had been carrying postal cars in which the railway mail clerks distributed the mail in transit, postal car service was reduced and the mail carried in the baggage car which was cheaper or held for a later train, which was cheaper still.

"Republicans and Democrats alike criticized Postmaster-General Burleson and his policies. In the last campaign it was promised that those policies would be changed and, particularly, that the Railway Mail Service would be restored. But now after more than two years it has not been done.

"The railway postal clerks are more than willing to take off their coats and give the people a good postal service. But under present restrictions they cannot do it. No degree of efficiency on the part of the employes can overcome the handicap to the postal service that has resulted from the curtailment of post office mileage."

Thus, if the complainants are right—and they present convincing figures in corroboration of their charges—Burlesonism marches on, at least within the realm of the little-known but exceedingly important R. M. S.

Japanese Emperor's Summer Palace

This remarkable marble boat was built by the Empress Dowager as a summer palace and is a favorite of the present Emperor, who spends many hours on it.

Her Microscopic Photos of Tiny Organisms Have Done Much for Scientific Research

Her Work in Searching Out Parasite Is Held of Great Value in Fighting Bubonic Plague

Now in Her 80th Year, Has Been Honored by Many Scientific Societies for Unselfishness

MISS MARY ALLARD BOOTH

By HENRIETTE BOECKMANN

THE only living woman photomicrographer is nearing her eightieth year and her name is Miss Mary Allard Booth. The family residence in Springfield, Massachusetts, is still Miss Booth's home, and the family coat of arms bears this insignia, "What I hope to accomplish, I shall accomplish," which at once leads to the remarkable history and accomplishment of her whose work so powerfully aided the government in ridding the country of the bubonic plague.

With the furtherance of science uppermost, Miss Booth has, in 40 years of photomicrographic work, delved deeply into study of parasites, of animals and of vegetation, and the fruits of her labor compose an encyclopedia.

With only that tragic outlook of a bedridden life before her, Miss Booth, at the age of 20 years, made a trip to the seashore one Sunday, being carried from carriage to train in her father's arms. While sitting there a good fairy appeared in Miss Mary Halliday, of Brooklyn, who picked up bits of seaweed and by her explanation and the young girl's interested examination, sowed the seed for microscopic study that resulted in a woman scientist of such mature knowledge that the doors of scientific societies, once open to men only, have admitted her. Recovering, Miss Booth has for many years traveled, collecting and adding to her vast assortment of microscopic slides.

While insect anatomy has been the principal object of her study, Miss Booth has also extensively photographed many other subjects purely for the portrayal of exquisite design.

It is through her photomicrography of disease-carrying parasites that Miss Booth has been enabled to give great aid to humanity. The eminent Pasteur said, "It is within the power of man to rid himself of every parasitic disease," and at a later date Professor Irving Fisher said that at least 15 years could at once be added to the average human lifetime by the science of preventing disease. It was by photographing the bubonic plague fleas on the rats of San Francisco at the request of Surgeon General Blue, that Miss Booth nipped in the bud the spread of the plague.

From the study of these highly magnified disease-carriers, science learns what it did not know heretofore. Photomicrography allows of unlimited expansion in the field of bacteriology, and in the treatment of germ diseases great strides have been made with the help of these clear-cut photographs of the smallest parts of insects, often so minute as a whole as to defy discernment with the naked eye. In many instances a disease is identified by the mosquito or other insect that spreads it, as, for example, a malaria-breeding mosquito may immediately be recognized by its photomicrographed wings. Besides having fulfilled numerous Federal orders for her work, Miss Booth's photomicrographs are in demand at universities from the Atlantic to the Pacific, and her exhibitions have been many times seen at museums.

Photomicrography necessarily calls for a broad knowledge of zoology and botany, as well as expert photography. Scientific perfection is the goal which must be striven for, and this requires long and arduous labor. Pictures such as Miss Booth takes are often made only after hours of patient adjusting and scrutinizing, until the perfect reproduction is the result. These photographs appear to be the most exquisitely drawn pen and ink sketches, yet are actually much superior to drawings, for absolute truth is essential if these likenesses are to be of benefit to science.

Miss Booth showed the writer marvelous little pictures which would delight any bacteriologist. Among them were the gizzard of a cricket, the pygidium of a flea, parasite of an ox, flea of a mouse and that of a hedgehog, a sheep tick, bird lice, fleas of a woodchuck, the parasite of a loon and that of the snowy owl, and the beautiful tongue of a fly.

Many interesting facts relating to the life of insects reveal themselves to the observing eye of this photomicroscopist. For instance she took note that a bumblebee when out gathering pollen, takes only one kind on a trip, passing by all flowers not furnished with that especial "brand."

Such photographs as that of the eye and the foot of a spider, the foot of a caterpillar and the tongue of a butterfly would be of interest to the orchardist, whereas a cross-section of a piece of mahogany and a transverse section of blackberry stem are made chiefly as adventures into a realm of beauty, entrance to which may only be gained by the door of the microscope.

It was in 1877 that Miss Booth obtained her first miscroscope, and it was not many years thereafter that she had gathered about her a complete working apparatus for photomicrography. So well-rounded are her resources and equipment that it is possible for Miss Booth to finish the process of mounting, photographing, and developing, all within an hour's time of the gathering of the subject. Equipped with a license from the city of Springfield, Miss Booth is further enabled to procure subjects from park ponds.

This tall, well-dressed and thoroughly feminine scientist has also perfected herself in the art of preparing lantern slides by the use of the microscope and the camera. Illustrative of the development of photography, Miss Booth is preparing a collection of photographs which will be added to the National Museum.

Upon the death of Miss Booth's father, who was a collector of microscopic slides, the head of the Entomology Bureau at Washington declared it a pity that such a collection should be lost. Thereupon the daughter set about to complete it for the National Museum. Stupendous, indeed, is the task of Miss Booth in arranging some 1,000 microscopic slides of diatoms, with as many as 100 diatoms to a slide. The national curator has declared that when this collection is completed, it will represent the second largest of microscopical organisms classed as seaweeds and possessing characteristics of both plants and animals in that, unlike other plants, they have the power of voluntary motion, and unlike most animals they possess chlorophyll.

Besides appearing in the American "Who's Who" and various other compilations, Miss Booth is mentioned in "American Men of Science." This talented, persevering woman is also a member of the Royal Microscopic Society of London, the Royal Photographic Society of Great Britain, and, at 75 years was made a member of the New York Microscopical Society. The first exhibition of her work was in 1886, at the New Orleans Exposition, where she received a medal. At the Panama-Pacific Exposition, a large space was taken up by Miss Booth's photomicrographs, and her work was awarded the grand prize in the educational exhibit.

The preservative influence of science on the human mind is aptly illustrated in the case of Miss Booth whose attitude toward her work is described by her words that "every new discovery is a new revelation of God."

Advertising Did It: The Story of Los Angeles

Concluded from page 9

Some day, of course, the Chamber of Commerce will take up the matter of transportation and traffic, and then things will begin to hum. At present that civic dynamo is concentrating its efforts upon expansion of industry and the harbor. Characteristic of its aggressiveness is the excursion of a large delegation of business men to Hawaii to preach the desirability of trade with Los Angeles. The writer's interview with the Chamber's publicity director was interrupted the other day by one of these booster guys.

"I want you to get me up a bunch of statistics about Los Angeles," he said. "Population, exports, imports, temperature, number of rainy days, and all that stuff. I want to make about eight hours of speeches when I get to Honolulu. I'll weave in the fluff if you'll just give me some of the hard facts."

That's the way they do it. It was more than a month before a direct steamship line was to be opened up between Hawaii and Los Angeles, and the booster hounds were already on the job. Before they get through, the islands will be lying about two feet deep in fancy literature anent Southern California, and the Honolulu gals will be deserting the beach at Waikaiki to swim at Santa Monica and Venice.

No less than 28 publications, including a monthly magazine called *Southern California Business,* are issued by the Chamber of Commerce. Its offices remind one of a thriving corporation, and there is symbolism in the fact that one of the daily newspapers is published in the same building. The faint rumble of the presses carries up to the ears of the Chamber folk as if in constant reminder that printed propaganda made Los what it is today.

9,000 in the C. of C.

INCIDENTALLY the Chamber claims to be the largest commercial organization in the world. Nine thousand citizens, each paying an annual fee of $25, comprise its membership. It is divided into 12 departments, under the direction of experts. Foreign Trade, Industrial, Agricultural, Marine, Industrial Music—these are some of the departments that shout the glories of Los Angeles and serve those who come to the chosen city.

Other Southern California communities are following the big town's example. No place so small that it hasn't a Chamber of Commerce, ballyhooing at the top of its voice. And no place so small that it doesn't bristle with its own dignity and importance.

"By the way," cautioned the city editor when this writer first began work on a Los Angeles newspaper, "we never speak of the little towns around here as anything but 'cities.' They resent it if we call 'em 'villages' or 'towns,' and the secretary of the Chamber of Commerce immediately indites a hot letter to me. My mail's too large as it is—so kindly have a heart."

Santa Monica and Venice, lying side by side as the aquatic playground of Los Angeles, are perhaps the livest of the hoorah "cities." The palisades of the former fringe a bay which, back in '75, was scheduled to make it the "maritime metropolis of the Southland." Excursion steamers came down from San Francisco. Los Angeles, then a hopeless young town minus a Chamber of Commerce, sent a wee crowd of its own.

"The zenith city by the sunset sea"—that would be Santa Monica, according to Tom Fitch, who was brought there for the occasion because of his silver tongue. He painted a wonderful picture of the future —a picture full of "white sails of commerce dotting the harbor," with "products of the Occident and Orient unloading at the wharves"—a picture shadowed by "factory smoke darkening the horizon." Barren lots, attaining great dignity through the oratory of Fitch, sold for as high as $500.

Santa Monica Is Astir

BUT look at Santa Monica now! The factory smoke is back in Los Angeles, which started out on an agricultural and meteorological foundation, and the twentieth century version of "white sails" is seen in its harbor at San Pedro. Santa Monica itself, under the guidance of the Greater Santa Monica Club, is running full-page advertisements in the Los Angeles *Times* to inform the world that Santa Monica is "A National Playground."

"Located in the front yard of Los Angeles, 45 minutes from the central business district," says the advertisement, and there are half tones of bathing girls, sloops, speed boats, golfers and shady roads to prove that Santa Monica's aspirations to become the "maritime metropolis of the Southland" have suffered a sea change into something entirely else again. It acquired a Chamber of Commerce too late in the game!

Now the good folk of Southern California, not content with squeezing the eastern pocketbook during the winter months, are megaphoning for summer tourists. An organization known as the All-Year Club, composed of business, hotel and railroad men and affiliated with the Chamber, has been formed to conduct the new ballyhoo. It opened up its campaign last spring by spending $150,000 in magazine and eastern newspaper advertisements.

"You see, we have always boomed Southern California as a winter resort," explained Rathbun, the publicity shark. "The natural inference, of course, is that Los Angeles and vicinity is a bit hot in the summer. As a matter of fact, we Angelenos regard it as the pleasantest time of year. There's no reason, particularly with the summer excursion rates, why we shouldn't have a bunch of tourists throughout the warm months, too. We're out to get 'em."

Then, being a candid sort of fellow, Rathbun divulged the Chamber's theory of advertising. He quoted Sarah Bernhardt, who is supposed to have made the naïve query: If the world does not continue to hear of Bernhardt, how will it know she still lives?

"It's the same way with us," said Rathbun. "We keep Los Angeles continually before the world. We let it know we're part of the map. If a local florist develops a new rose which takes a prize in Paris, we shout about it. We send out a picture of the rose and tell how it was born and bred in Los Angeles. Our idea, you see, is not just to give out propaganda, but to make decent copy with a fair percentage of news value to it."

This municipal horn-tooting is beginning to have an echo from north of the Tehachapi Mountains, that boundary line between Southern California and the benighted part of the state. Yes, San Francisco is finally realizing the value of advertising and is setting out a bait for the tourists. A campaign committee has been organized, with the president of the Standard Oil Company of California as its chairman, and within less than a year the boosters hope to be far enough along to command a cool million from communities north of the Tehachapi to carry on their ballyhoo.

Even the enemy country is being invaded. The writer has before him a neat, two-column "ad" clipped from a recent issue of a Los Angeles paper. The text states that San Francisco's "salt air and sea breeze effect a bracing, comfortable and invigorating climate for your vacation," which is quite true, and then it mentions something about amusements and sports. It might have added that, although some other California cities may be overstocked on climate, San Francisco has atmosphere. And a metropolitan air, besides.

It is a curious study, that of these two coast cities, San Francisco is California; Los Angeles is the East and Middle West. The latter's population is heterogeneous, with practically every state in the Mississippi Valley represented by a society of its former residents. Ninety-six per cent of Los Angeles' citizens are from elsewhere, and a considerable portion of these transplanted inhabitants have had a way of looking over their new home town soon after arriving and saying:

What Los Angeles Is

"WAL, now, you ain't got the kind of traffic signals we use back on the main street of Prairieville. They worked out right well, too. Why don't you try 'em here?"

And so the suggestions streamed in and this eastern colony on the mesas of California, aided and abetted by the god of ballyhoo, grew into a great city that is a municipal composite of Wichita (Kansas) and Des Moines (Iowa) and Lincoln (Nebraska) and Peoria (Illinois) and Whatnot (United States of America). Meanwhile San Francisco, wrapped in its proud mantle of Native Sondom, stood aloof and smiled disdainfully at the spectacle of a town advertising itself into greatness. Yes, the Golden City, with the most wonderful bay in the world, watched Los Angeles build up a harbor and a commerce, becoming a maritime capital despite the fact that the imports and exports have to be hauled a score of miles overland to get from the docks to the rest of the city! It watched Los Angeles lure industry to Southern California, although San Francisco itself is more centrally located on the Pacific Coast and its bay is fringed with perfect factory sites.

These two California cities remind the writer of a pair of towns in Tangipahoa Parish, Louisiana. One of them, Hammond, is a hustling community with a flock of industries and a lot more coming. Its streets are paved, and it has several movie theaters, and more of each are in prospect. The other town, Amite, is the parish seat of Tangipahoa—and that about lets it out. The cinema is a Saturday-night rite in Amite. It's so sleepy that only the daily spectacle of the Panama Limited, thundering through on its dash to New Orleans, keeps the citizenry from pulling a complete Rip Van Winkle. The Panama *stops* at Hammond.

"She should be stopping here," the editor of Amite's weekly paper told the writer. "She *would* be stopping here, too, if we hadn't been so stiff-necked and exclusive back in the '80's and '90's.

And Frisco's Growing, Too

"DO YOU know," he went on glumly, "this was the big town of the parish when Hammond was a pup. Then Hammond began advertising for northern settlers and northern capital. They welcomed the folks from Illinois and Wisconsin, whereas we of Amite put up the bars to them. We had the start. We could have been the big city of the parish and had the Panama stopping here, but we turned down our chance."

The analogy is a general one. San Francisco, although hampered by a great fire and by a particularly cankerous labor situation, is still growing. It showed its stuff when—in 1906, the year Los Angeles started affecting a harbor—it picked itself out of the ashes and immediately began relaying the municipal foundations. It showed the rest of the country the pure quill in convention jobs when it handled the Democrats at their last national powwow with a hospitality never before dreamed of. It showed the world how-come at its great exposition not so many years ago. But—

San Francisco, like the little town of Amite, sat smug too long in its pride of birth. Until recent years you had to be a native son to get the gladeye and the helping hand. Outsiders were greeted with the icy stare and the ammonia-piped shoulder. They were glared at in San Francisco and slapped on the back in Los Angeles. The latter, like Hammond, advertised for 'em to come and then hung out the sign of welcome.

There is significance in the fact that they've finally instituted a ballyhoo north of the Tehachapi. It shows they're waking up—and waking up just in time, too. Otherwise, sure as there are little oranges to put in the bottom of the box, San Francisco would fall in line behind San Pedro and Hollywood one of these days and become annexed to Climatetown!

How We Utilize the Sun Energy of the Tropics

Concluded from page 7

before they are fully grown, or they will be overripe when they reach their destination. After their removal from the plant, they continue to grow, by absorbing nutrition from the stalk. It is important not to gather them when they are too green, or they will be tasteless. But the bananas destined for points at a distance from the seaport, requiring a longer time for their transportation, must be gathered in a less mature condition than those which can reach their destination in a shorter time.

Banana bunches must be handled very carefully to prevent bruising. A padding of banana leaves serves as some protection. The men must be trained to handle the banana bunches so carefully as to reduce bruising to a minimum.

Tramways bring the bananas from different parts of the plantation to the banana railway. By the banana railway, or sometimes by river or canal boats, the bananas reach the shipping port, where they are transferred to the large ocean steamers by means of mechanical conveyors, at the rate of several thousand bunches an hour. Refrigerating plants on the steamers maintain a low temperature, and retard the ripening process. Fruit destined for points some distance inland is transferred from the vessel to special banana trains, which are arranged to give forced ventilation to the fruit. Removing the warm moist air holds back the process of ripening. From the vessels, the fruit is unloaded by conveyors, which effect a saving of time and labor, and reduce the handling and the consequent bruising to a minimum.

During the ocean trip, the fruit is carefully inspected, and again as it is being unloaded. Any fruit that is nearly ripe is sent to a near-by market, and that which is fully ripe goes immediately to the peddlers, thus minimizing the loss from overripe bananas.

There is a somewhat general notion that the bananas marketed in this country are inferior to those eaten in the tropics. This may have been the case in the early days of the banana trade when bananas were shipped here in tinfoil, and were possibly a month or more on the way. But with the modern methods of handling the fruit, one who buys a banana in Denver may have just as delicious a morsel as the native of Panama—provided he allows his banana to ripen before eating it. Bananas ripened on the plant are not superior to, or more palatable than those which have been picked green. Natives of the tropics never leave the bananas on the plant until they are ripe, for if allowed to mature on the plant, they lose flavor. Moreover, they are liable to split and become a prey to insects.

There is a general impression that edible bananas grow wild in the jungle. Some authorities deny this, saying that the wild bananas are seeded varieties that even the natives will not eat if they can obtain the cultivated varieties. There is some reason, however, to doubt this last statement, for persons who have lived long in Northern South America say that there are good bananas among some of the wild tribes away from the influence of the white man, where there is no probability that there has been any cultivation.

Another misconception regarding the banana is that it is ready to eat when it is yellow. But the banana is not mature and at its best state until the outer skin is partly darkened, and the pulp mellowed. One reason why many suppose the banana to be indigestible is that it is eaten in an immature state. To do this is the equivalent of eating apples not fully ripe. Some persons may get by with it, but many cannot. There is no reason why bananas fully ripe but not overripe should not be fed to children. Bananas baked, whether with their skins or peeled, make a delicious custard, excellent for children as well as adults.

In food value, the banana excels the potato, and almost equals the sweet potato. Being edible without preparation, it has a place all its own as a source of carbohydrate. It is a veritable pure food, packed in a sterile package. With the exception of the grape, no common fruit has a food value at all comparable to it.

Dried banana is a most delicious food, something like dried fig, but without seeds, and with a delightful flavor all its own. Because of its excellent keeping qualities, its ease of transportation, the possibility of shipping it long distances, even into the arctic regions, and the possibility of using bananas for drying which are not suitable for shipment, such as small bananas, small bunches, bruised bananas, and the like, and bananas grown on islands too remote to be within the reach of a good market for fresh bananas, there is no good reason why a profitable and useful business could not be developed handling dried bananas. Once properly introduced, dried bananas should find a steady and growing market.

"Senatorial Courtesy!" It's a Changed Brand!

Concluded from page 6

pearance in Washington some years ago. Since that time I have been on terms of social intercourse with him, and have observed his conduct in the social and private relations of life, and I feel bound to say that for kindness of heart, humanity and exemplary deportment as a private citizen, he would probably compare with the Senator from Kentucky, or with any Senator on this floor by whom he had been assailed."

Senator Clay again took the floor, and after describing what he described as the "infamies" of Blair and his newspaper, the *Globe,* he met the personal issue as follows:

"For the Senator from Alabama to undertake to put me on an equality with Blair, constrains me to say, it was FALSE, UNTRUE and COWARDLY."

Senator King arose quickly and addressing the chair said: "Mr. President, I have no reply to make—none whatever." He then withdrew from the Senate chamber. Later a page came in and whispered to Senator Linn, of Missouri, who went out with him. Linn soon returned and handed a note to Mr. Clay, who wrote something and handed the paper to Mr. Archer, of Virginia. This was subsequently understood to be a challenge by King and its acceptance by Clay. Friends of the great Kentuckian, however, perceived that he had done King an injustice and foresaw that a duel, if it did not encompass their idol's death, would seriously hurt his political prospects and they sought to bring about an amicable understanding. King would withdraw his challenge only on condition that Clay apologize from the floor. This was at first met with a positive refusal on Clay's part and several days were consumed in arriving at an understanding which averted the duel. Senator Preston, of North Carolina, played a prominent part in the conciliation. He finally arose in the chamber and referred to the "unpleasant collision." He pointed out that Mr. Clay thought the language of Mr. King was intended to be injurious to his character and personally offensive, and, with that feeling, Mr. Clay had retorted in language of direct affront, using language which Mr. Preston said he was convinced he would not have used except under a deep sense of injury. Furthermore, he thought Mr. Clay had misconstrued the remarks of the Alabama Senator and, from information in his possession, he was sure Mr. King intended no personal affront. He announced it as his confident belief that as the whole affair grew out of a misapprehension, there would be an adjustment "which was earnestly demanded by the Senate."

This preliminary explanation having opened the way for the amendé honorable, Senator Clay arose and said he shared with the Senator from North Carolina the regret he had manifested by reason of the occurrence which had disturbed the harmony and good feeling of the Senate. He explained that while Senator King was speaking he thought there was a studied effort to cast reflection upon him and his character, and when the speaker closed by comparing him to a man whom he had the day before branded as infamous, there was no doubt in his mind that his object was personal offense. But, he concluded, he had received information upon which he placed implicit reliance that such was not the intention of the Senator from Alabama and that it was not his purpose to cast the slightest imputation on his honor or character. He was ready at all times to repair an injury, and it was with pleasure that he withdrew everything he had said reflecting on Senator King's honor.

Senator King followed with the statement, that he concurred in the declaration of the Senator from Kentucky that it was every Senator's duty to the body of which he was a member studiously to avoid all personalities, and that it had not been his intention to reflect in the least on Clay's character, and that he accepted with pleasure the olive branch thus extended. Senator Preston expressed his satisfaction at the harmonious ending of the misunderstanding. While Preston was speaking, Mr. Clay rose from his seat, crossed the chamber, and, arriving in front of Mr. King's seat, is said to have exclaimed: "King, give me a pinch of your snuff." King sprang to his feet, held out his hand, which was cordially grasped by Mr. Clay, while the galleries and Senators applauded.

The Brooks-Sumner affair, growing out of discussion of the slavery question, in which Representative Preston S. Brooks, of South Carolina, assaulted Senator Sumner, of Massachusetts, with a cane on the floor at the conclusion of a Senate session, was another memorable one. Sumner had arraigned in severe terms Senator Butler, of South Carolina, a kinsman of Brooks, who was absent from the Senate, and also, in the opinion of the assailant, had reflected on his state. An ineffectual effort was made to have Brooks expelled from the House. This failed, but he was fined $300 in the criminal court. Coming at the time it did, this affair helped inflame public feeling, North and South, over the slavery question and contributed to the unfortunate conditions which followed.

The painful impression is left on the casual spectator to the Senate galleries that the decorous days of Webster, Clay and Calhoun are of the past and that a new order prevails in the Senate with a modern standard of senatorial courtesy. When the Senators of Civil War days had their occasional clashes they usually grew out of the discussion of questions that shook the Republic to its foundation. The dueling code has gone, but the Marquis of Queensbury rules may have to be substituted unless the Senate's behavior improves. Dueling was barbarous, but it had the virtue of making gentlemen careful of imputations against the honor of one another. It causes one to wonder whether the continual infiltration of foreign stock into American life has brought about a condition that is thus reflected in the Senate.

Her Work in the Red Cross Has Been Inspiring

By J. H. WALTON

MISS IDA F. BUTLER

MISS IDA F. BUTLER, whose official title is "First Assistant to the National Director," is located at the National Headquarters of the American Red Cross, Washington, D. C. It is here the task of maintaining the numerical strength and morale of nearly 39,000 Red Cross nurses, assigning them to service, directing their activities and constantly renewing their inspiration by means of wise and sympathetic counsels, is carried on.

A graduate of the Hartford Training School for Nurses, and for 12 years the head of the Maternity and Gynecological Department of the Hartford (Connecticut) Hospital, she had succeeded to the position of supervisor of probationers there when the World War gave her the opportunity to undertake foreign duty under the American Red Cross Nursing Service. The unit of which Miss Butler was head nurse arrived in Paris in March, 1918, just when the great German drive was nearest to Paris. Miss Butler was detailed by the American Red Cross Nursing Service to establish a hospital at Lyons, and to reorganize a second at the same place. At the conclusion of her service in France Miss Butler came to National Headquarters, where she was chosen for the Chautauqua lecture series by which the Red Cross was seeking to stimulate throughout the country a wider interest in their peace program which was largely concerned with health education.

The true value of Miss Butler's present service to the American Red Cross is best appreciated by a close-up of her everyday routine at National Headquarters. Avalanches of mail pour ceaselessly over her desk. Peeping over her shoulder, let us learn at first hand the nature of the correspondence. The first letter discloses the problems of a young nurse struggling to create an up-to-date conception of community hygiene and sanitation in one of the West Indian groups of A. R. C. nursing activities. With the warmth and responsiveness born of her vivid imagination and far-seeing judgment, bred by her years of technical training in the same field of human uplift, Miss Butler dictates a reply that goes forth to the lonely, discouraged nurse with the cordial intimacy of a handclasp and a smiling "well done."

Hailing from the far-off Philippines, the second letter appeals for a nurse, "tactful, dignified, mature in experience, with elasticity of mind, preferably one accustomed to tropical conditions but energetic; possessed of initiative but willing to subordinate her own ideas and desires absolutely to whatever policy may later become necessary; with long training in maternity cases, some background as a school nurse, and having qualifications also for supervisory and instruction work."

Quite a large order, we who are unacquainted with the facts would think, but Miss Butler does not even consider this an unusual or difficult assignment. The American Red Cross roster of 39,000 picked nurses, augmented monthly by an average of 100 new enrollments, furnishes a variety and richness of human material and professional experience that guarantees the right person for the particular niche, no matter how exacting and multifarious the requirements.

"Miss Butler has given me enough helpful suggestion and encouragement in half an hour to carry me through my work for the next six months," was the tribute of one grateful nurse, who emerged with radiant face from an interview with the first assistant. "You can confide in her and know that she understands."

The Racial Facts of the Money Question

Americans Never Agreed With System Which Originated in Oriental Mind

BANKING and finance have always seemed strange, "foreign" or mysterious to Americans. We have always felt a sense of identity with our other political and industrial institutions, even when we have discussed their faults. But as to finance there has always been popular distrust. Since Hamilton imposed his ideas on the young Republic, American political history has been punctuated with revolt against the banking and fiscal system. The Jacksonian epoch was one expression of this. The state bank experiment was another. After the Civil War, greenbackism and then free silver were expressions of this profound conflict between popular instinct and the fiscal system based on the gold standard or its later development into "asset" currency—the "assets" being the least tangible of all industrial values—commercial credit.

Perhaps the fiscal system is the only institution which has survived for so long a time a general popular suspicion. But even in its survival there have been considerable periods in which it has been in abeyance, while experiments—usually hampered or ill-conceived—were attempted in the effort to supplant it.

Perhaps the disharmony between the ideas of the American people and the fiscal system, with which they have been in daily contact for about four generations, may lie in the incongruity of that system with the racial genius of the American people.

Americans in the main are still a North European folk. The mind of the North European man is essentially synthetic—indeed, objective. He is an adventurer, explorer, experimenter and PRODUCER. Mastery of THINGS, dominance of the outer world, is his life aim. He concerns himself comparatively little with what is going on inside his own brain, or the brains of his fellows. In industry, this racial characteristic is shown by the pre-eminence of the North European as a farmer, manufacturer or engineer. He is concerned with the conquest of Nature, rather than with the manipulation of human relations or the control of human thought. *As a merchant, politician or diplomat he has never been the equal of the more subtle man,* of the races which prevail on the Mediterranean littoral and which have left persistent strains throughout the British Isles and the other North European lands. The artistic superiority of the Mediterranean man is another expression of this racial difference.

Now banking, finance and all that sort of thing were originally Mediterranean, not to say Levantine. They were developed by the trading races of the south, whose main idea of wealth accumulation was that of bargaining or manipulation, rather than extraction from the earth and the forces of Nature. Reared in a region where Nature was more lavish, the necessity of conquering her was not so pressing for these races as in the homelands of the North European man.

The very vocabulary of finance, like the three balls over the pawnshop, comes from Italy or beyond. The law of banking and commercial paper is still known to lawyers as the *lex mercatoria.* It is a lately adopted child in the Saxon family of the common law, a waif laid on the doorstep of medieval England by the swarthy strangers who brought their wares and their usury to the fairs of "Merrie England."

This may explain a great deal of current history when thought out.

Last winter there were farmers in Illinois, possessed of hundreds of rich-producing prairie acres, who could not borrow a $5 bill at a bank.

At this very time on Halsted street, Chicago, olive-skinned merchants from the Ukraine or the Levant, could find ready financial accommodation, even though the laurels of more than one successful bankruptcy were still to be found entwined in their hair.

Such is the difference between "liquid" and "frozen" assets in the fiscal system which now prevails in the United States.

It is primarily a system created by trading peoples for purposes of trade. *It is not adequate for a race of pioneers and producers.*

OF ILLINOIS
URBANA ILL.

BRIEFLY TOLD

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Kiss clinics for marriageable girls, to solve America's divorce problem, are advocated by a noted Parisian stage beauty who is visiting Chicago. "A woman's whole heart should be put into every kiss she gives her husband," she declared. "A kissable woman will keep any normal man anchored at home. Too many wives think they can hold their husbands through their stomachs. Scientific love is more practicable than domestic science."

Montreal's bachelor tax, yielding $100,000 a year, was voted down. The vote stood 23 to 8 in support of an appeal to the provincial legislature to repeal the law.

The "Christ of the Andes" is a statue of the Savior, cast in the bronze from the cannon of opposing Argentines and Chileans, standing nearly 13,000 feet above the level of the sea at Cambre Pass, on the mountain frontier between Argentine Republic and Chili. It was placed there in March, 1904, as a symbol of the perpetual peace which was then sworn to by the opposing nations. An inscription on its base reads, "Sooner shall these mountains crumble to dust than shall the people of Argentine and Chili break the peace which they have pledged themselves at the feet of Christ the Redeemer."

In the interior of Argentine, cattle are so plentiful that beef on the hoof often sells for less than two cents a pound and cattle are sometimes given to the butcher on condition that he shall return the hide to the owner.

An office manager of a large corporation uses a method all his own for discovering to what mental type applicants for positions as clerk and stenographer belong. He strews the anteroom with the latest copies of magazines ranging from *Zippy Tales* and *Cinema Scandals* to the more staid and worth-while publications. Ofttimes while waiting, the applicant picks up the periodical interesting him or her most.

The Vatican has issued a warning to prelates not to take part in politics.

A gasoline substitute, made from prickly pear juice and mixed with other chemicals, has shown remarkable results. It is known as "spring bok," motor spirit, and is made in South Africa.

A muskrat was the cause of Stevenville, Ontario, going without electricity for three days. Workmen searching for the trouble dug down to the underground cable and found that a muskrat had chewed the cable to get the beeswax inside the insulation and had been shocked to death.

The parlograph, just invented by a German, may be described as a dictaphone and telephone combined. Sitting at your desk you can, by using this instrument, do business with any person located elsewhere. The parlograph, after being connected with your telephone, gives a permanent record of what is said and done, by both parties to the transaction.

A blue-winged teal, banded in Lake Scrugog, Canada, 16 miles from Lake Ontario, was found in Trinidad, 3,000 miles away, two months and seven days later.

A manufacturing company shipping its product long distances from the factory by truck utilizes this means of transportation every hour of the day and night by providing a sleeping compartment above the seat of the driver. One man sleeps and the other drives. The bed is similar to a Pullman berth with windows on three sides to provide ventilation. In this way practically all bills for lodging are eliminated and considerable time is saved on the way.

Big Ben, the clock in the Parliament tower in London, is wound by an electric motor. The bell of the clock was cast in 1858.

Five thousand dollars was paid for a single branch of red apples in Ferrell, New Jersey, by a nursery firm. A record and agreement of purchase have been filed with the county clerk. The owner received $1,000 outright for the purchase of the apple branch, and will receive $4,000 additional in installments at the rate of two cents each for every tree budded from this branch, which is to remain on the tree in the orchard, according to reports.

A man in Gratz, Austria, who had hanged himself from a tree, was cut down by a farmer. During the operation one of his legs was broken, caused by his landing in a ditch. He sued the farmer for hospital expenses. The lower court granted his demand. The superior court, however, considered that the farmer had done a good turn to the man who wanted to die, and his duty as a Christian citizen. The higher court held that he could not be held responsible for the consequences of his act and denied the would-be suicide his claim.

Automobiles and launches of Brazil are successfully using alcohol as fuel.

Snow has melted from the cross which gives the Mount of the Holy Cross its name. The Mount of the Holy Cross is in Colorado and the snow has melted on the cross for the first time within the memory of the oldest inhabitant. However, the outlines of the cross are discernible 20 miles distant.

The center of alien white population in the United States moved westerly for the first time in 30 years. The new center is in Allen County, Indiana, about 10 3-4 miles east of New Haven and 16 miles east of Fort Wayne. It is due to the increase in foreign-born white population in California, Texas and Arizona, according to the Census Bureau.

The British Government got out a new half-penny stamp for the West Indies, containing a picture of Christopher Columbus looking through a spyglass as he discovered the islands in 1492. Columbus died more than a century before the first telescope was devised.

Indian characters, centuries old, cover the walls of an Indian cave hidden away from the white man's eyes and recently discovered on the estate of Valentine Hememan at Boothbay Harbor, Maine. The cave runs back 40 feet under the hillside and can only be reached by a sudden drop of 15 feet over the ledges.

Holland and her colonies have no tariff and believe in free trade

The owner of a shoe store in Amsterdam has announced that during one week he will pay for men's and women's shoes 2.50 guilders and for boys' and girls' shoes [illegible]50 guilders to each customer who buys a new pair of shoes from him. The old shoes, which must be repairable, will be given to the local poor commission for distribution among the needy.

DEPENDABLE INFORMATION

After reading this copy of THE DEARBORN INDEPENDENT you will have observed that the information it contains is based on fact. There is no room for half-truths and misinformation in this publication. THE DEARBORN INDEPENDENT believes that the people of this country prefer facts to buncombe, substantial information and wholesome ideas rather than sensational appeals to the emotions. CHRONICLER OF THE NEGLECTED TRUTH

"Allah Achbar: Mohammed Resoul Allah!"

War Cry of Kemalists Brings Union of Moslems to End White Suzerainty

By CLIFFORD ALBION TINKER

"GOD is Great! Mahomet is the Prophet of God!"

Such is the war cry of a people numbering upward of two hundred and thirty million souls. Although a medieval war cry, it was not like other medieval war cries; it did not become obsolete when mailed men and horses went out of fashion at the muzzle of the gun. Fanatical or not, as you choose, it is an expression of religious faith; it is at once a sermon, a prayer, a defiance—it is more, it is the rallying-cry of the Faithful.

Sped on by that thrilling cry, the Arab Moslems, in the hundred years following the death of the Prophet, trampled down all the proud old dynasties of the East, extended their empire and their faith over immense regions of Asia and Africa, including the land of the Khosrus, great territories in India, Syria, the kingdom of the Pharaohs, the whole of North Africa to the Atlantic shores of Mauritania, and, more remarkable conquest, overran Spain and Portugal and fought a battle for the control of all Western Europe on the plains of France less than 100 miles from the walls of Paris.

Five hundred years later, urged by the same war cry, the Turks, at first a little band of less than five hundred fighting men, began a career of conquest which absorbed all the power of the Arab and Persian and carried them to the walls of Vienna. In two hundred years the boundaries of the Ottoman Empire ran from the peak of the Persian Gulf to Azov on the River Don; from Azov to Lemberg and Buda; from Buda to the Adriatic. Syria, Arabia, Egypt and North Africa bowed to the Sultan, and his fleets swept the Mediterranean. Yet greater glory, the Caliphate of Islam sat in Ottoman Constantinople; the Sultan was the Defender of the Faith—he was also the Emperor of the East, the successor of Constantine and Hadrian.

Christendom, in the last 400 years, has worn down the power of Islam until the Sultan-Caliph is a mere prisoner in his Mosque at Constantinople, his empire is but a fragment of Asia Minor, and the great hordes of the Faithful are subjects of infidel powers. The religion founded by Mohamet is changeless, thus medieval; its followers maintain its spiritual strength, but its princes have lost their temporal power.

Islam Challenges Christendom

HOWBEIT, Christendom is once more alert, because today a militant minority of that great host of Islam has sprung to arms and raised that age-long rallying-cry: "Allah Achbar! Mohammed Resoul Allah!" Nor has that rallying-cry lost its potency. For the Turks of Anatolia have swept the Greek forces from Asia Minor and are now muzzle to muzzle with the British army spread along the high banks of the Dardanelles and the Bosphorus. More, they are soon to return to Europe. Once more Islam challenges the might of Christendom.

This is no mere bid for a place in the sun; it is the impatient gesture of a mighty sect bent on reclaiming its high estate in the affairs of mankind. Let there be no mistake about this revival of the Prophet's war cry. After centuries of humiliating shrinkage at the hands of decaying dynasties the Faithful have found a leader to rebuild their temporal structure. Well may western diplomacy tremble at locking horns with eastern religious fanaticism.

This Turkish Nationalist movement embraces more than the reclamation of Thrace, more than the repossession of latter-day Turkey in Europe, more than the reoccupancy of Asia Minor; it aims at the complete restoration of Islam. The keynote of the whole effort of the Turkish army is found in the "Nationalist Pact" of January 28, 1920.

Read the very first Article of the "Pact." "Those territories of the Ottoman Empire populated by an Arab majority and being, at the time of the Armistice (October 31, 1918), occupied by the enemy armies, shall be ruled according to the will of the local population." Those territories are Mesopotamia, Syria, Palestine, Arabia and Egypt. And, according to the Koran, the will of the local population is the will of the Caliph, none other than the Sultan of Turkey. To realize this political change Turkey must fight, and must win from Great Britain and France.

To continue: 'Those parts of the Empire situated on the Armistice line, inhabited by a Moslem majority, united by religious and cultural ties and animated by a similar desire for the establishment of their ethnical rights, *form a complete whole with us which shall suffer under no pretext whatsoever any dissociation."* These territories embrace Cilicia, recovered to Turkey by the Franco-Turkish Treaty of October 20, 1921, and the Mosul province of Mesopotamia, now in the hands of the British and garrisoned by British forces. It is needless to ask the question: "Will Britain give up the Mesopotamian oil fields without a struggle?"

This startling "Pact" from the almost dead "sick man of Europe" throws some negative sops to the powers concerned. From Article Two we glean the thought that the Turkish Nationalists are eminently fair: "In the case of the three sanjaks which united themselves to us by vote when they were first free, we accept a second plebiscite *if necessary."* This refers to the sanjaks of the Caucasus and covers territory in addition to that regained by Turkey through the Treaty with Russia and the Treaty of Kars with the Soviet republics of Azerbiajan, Georgia and Armenia signed by the Angora Government. Again in Article Three, the "Pact" provides that: "The juridical status of Western Thrace, *which has been made dependent on the Turkish peace,* shall be effected in accordance with a free plebiscite."

In the Nationalistic demands concerning Constantinople, there appears to be a willingness to compromise; the Fourth Article of the "Pact" reads thus: "The security of the city of Constantinople, which is the seat of the Caliphate of Islam, the capital of the Sultanate and the headquarters of the Ottoman Government, and the security of the Sea of Marmora must be effected. This necessity, once put and admitted, the Ottoman Deputies are ready to subscribe to any decision which may be taken by the Imperial Government, on the one hand, and the interested powers on the other, with a view to assuring the opening of the straits to world commerce and international communication." Here is a sop to the powers, but a deliberate bid for Russian assistance as well.

For sheer "buck passing" the Fifth Article of the "Pact" may be considered a glorious example, yet, if sincere, contains the remedy for deportations, massacres, and political slavery on both sides. It states: "The rights of minorities will be confirmed by us on the same basis as is established in other countries by conventions hitherto concluded between the powers of the Entente, their adversaries and certain of their associates. At the same time, we have the firm conviction that the Moslem minorities of other countries shall benefit from similar guaranties." This affects about 20,000,000 Moslems in Africa outside of Egypt; 26,000,000 in the islands of the South Seas and those large islands adjacent to the Asian mainland, including our own Philippines; 130,000,000 in Asia outside of those territories specifically mentioned in the "Pact"; and approximately 5,000,000 European Moslems scattered through the Balkan States. As a matter of fact, the Moslem population of India, about 70,000,000, is something more than a contemptuous minority—at the present moment it is a particularly disquieting minority, a tail about to wag the dog.

Coming to the sixth and final Article of the "Pact" we discover the Turkish, hence the Moslem, "Declaration of Independence." The Nationalists repudiate all so-called Capitulations which give foreigners in Turkey a diplomatic status and "go the limit." They proclaim: "With a view to assuring our national and economic development, and with the end of giving the country a more regular and economic development, and with the end of giving the country a more regular and modern administration, the signatories of the present pact consider the possession *of complete independence and liberty* as the *sine qua non* of our national existence. In consequence, we oppose all juridical or financial restrictions of any nature which would arrest our national development. The conditions of settlement of our proved debts shall likewise not be contrary to these principles." Here is defiance to international land-grabbing diplomacy, and to international financial consortiums as well. The entire "Pact," from beginning to end, is a plain declaration to the world that Turkey wants her independence here and now, and that such independence is meaningless without the restoration of her empire in Western Asia and Egypt.

Europe's Squabbles Kemal's Gain

WHILE admitting that the "Pact," as a state paper, ranks high and will long be of supreme interest in diplomatic circles, one wonders how the Turks can entertain any hopes of seeing it put into effect. At first thought, it seems impossible that such a program can be other than a "bluff," a mere trading schedule for regaining Thrace and the control of Constantinople. Yet even a brief survey of the general situation in the Near East will reveal a condition of affairs which provides grounds for Ottoman hopes. Rest assured that Kemal Pasha has something up his sleeve more tangible than diplomatic audacity; that he holds a few trumps in this dangerous game he has undertaken, and that the time has come, in his judgment, for him to throw down the leading card.

Perhaps the strongest card in Kemal's draw is the chaotic hodgepodge now obtaining in the relations between the various European nations; their hesitant policies are astounding in the extreme; their contradictory moves precluding united action in any respect; their itinerant conferences proclaim that "will-o'-the-wisp" character of European diplomacy and the sad weakness of Christendom. Just such conditions made it possible for the Arab Moslems to conquer half the known world in their day, and just such conditions allowed the Ottoman Empire to become a fact in the sixteenth century—disorganized Europe has always been the signal for the Prophet's war cry and the brandishing of the sacred sword. Taking the facts relating to the two former Moslem conquests as criteria, it is not difficult to understand why Kemal Pasha pursues the advantage which European disorder so surely offers.

At the time of the Armistice, the Allies had things all their own way. The Quai D'Orsay saw the creation of new Balkan nations, a rejuvenation of the Slavic elements of that section of Europe; it saw the Greeks on the road to reclaiming their lost empire; and there was a comparative unity of action among the Allies which boded ill for the Turks. Italy, France and England fell in with the schemes of the Greek Solomon, Venizelos, and guaranteed the restoration of Greece at the expense of Turkey. Greece was given all the Turkish territory in Europe, extending up to the very defenses of Constantinople; she was presented with the Bulgarian territory bordering on the Aegean; she was assisted to occupy Smyrna, especially by the British; she was granted Northern Epirus, part of Albania, and the Dodecanesus Islands in the Aegean. As for Turkey, she was pushed across the straits and left, a sad remnant of her former glory, a little portion of Asia Minor with her capital at Angora. Constantinople was internationalized, so was the shore on either side of the straits—Turkey was out of Europe at last.

First to upset this plan was Greece herself, the nation who had the most to gain by its continuance. An election swapped exiles. The exiled king, Constantine, was brought back to the throne and Venizelos became an exile. Since that day Greece has been on the downward road. This was due partly to incompetence chargeable to the Constantine régime, and partly to a change in Franco-British relations, the whole complicated by Italian rancor.

France changed her governmental leaders and, as many a new broom sweeps clean whether desirable or not, the new leaders started at once in a reversal of French relations with Greece and Turkey. Personal spite against Constantine, fear of Greek expansion becoming an agency of absolute control of the eastern Mediterranean by the British, and the desire to protect the French mandate of Syria against Turkish raiders caused the French Government to repudiate Greece and make a separate treaty with Turkey. This treaty gave back Cilicia to Turkey, guaranteed Turkey French support against Greece, and supplied Kemal Pasha with munitions to raise his army. Italy, alarmed at the rapid rise of Grecian power, for precisely the same reasons as those which prompted France to support Turkey, also made a separate treaty with the Angora Government. Despite British assistance, Greece fell before the revitalized Turkish power. Greece swept from her feet, England alone opposed the victorious Ottoman troops.

Turks Need Munitions

KEMAL and his Nationalistic followers in Angora raised the Prophet's war cry; all Islam responded. Nerved by that cry, the whole Moslem horde in British India and Egypt have promised aid to the Ottoman cause. British aid to Greece and British harshness to the Sultan have weakened British prestige with the Moslems of the empire. The inevitable return of the Turks to Thrace and Constantinople will further weaken Britain's hold on the volatile Moslem elements of her vast dominions in Egypt, Arabia, Persia, Mesopotamia and India. This is more critical than at first sight appears. Any tranquillity in those areas is due to force of British arms. To quiet Egypt, that people claimed by the Turkish Nationalists, Britain has set up what purports to be an independent nation; the new rule, however, is not accepted by the majority of Egyptians, and their chosen leader is in exile.

Small wonder that Kemal relies on the divided policies of the Allies and the unrest of the British Moslems as his trump card. But he has other cards in his deck to support the trump. Italy fears the rise of Slavic power in Southeastern Europe. Hence she opposes the diplomacy of Jugo-Slavia and Czecho-Slovakia, enemies of Turkey. Jugo-Slavia threatens the Italian colonies on the eastern shore of the Adriatic, the Slavs need a seaport; Czecho-Slovakia and Italy are at odds over the fate of Austria and the nationalist scramble of the Magyars; this eliminates the Little Entente of Middle Europe as an immediate danger to Turkish enterprise. To the west, Bulgaria, war-time ally of Turkey, presents the only direct problem for Kemal to solve. The return of Bulgaria's Aegean seacoast, turned over to Greece at the Quai D'Orsay, will answer for peace between that nation and Turkey.

One great handicap to Turkish Nationalism remains; the Turks have no munitions. They possess no great manufacturing centers to provide their armies with the sinews of war. Even should all Islam rise and join the Turkish army the Ottoman Empire has no facilities for equipping such a force. Here enters Russia. Kemal has already made treaties with Russia and the Soviet republics of the Caucasus, and echoes of these pacts have reached the Allies in the Russian demands that no lasting disposition of the Straits and Constantinople can be made without Russian participation. To back up this demand, Russia announces that she has re-established compulsory military service on all male citizens between the ages of 20 and 40, and that she proposes to raise a huge air force and also build up a large navy. Enemies of all social order other than their own, stung by their, so far, ineffectual attempts to gain recognition by the European powers, the Soviet leaders of Russia are ripe for vengeance. Hence the possibility of Kemal gaining reinforcements and acquiring needed munitions from Russia. In semi-official circles in London this contingency has been discussed since the winter of 1920—to forestall such action the British Government has made overtures to Russia for economic understandings, and did not stand in the way of Russian participation at the Genoa Conference. This Russian phase of the Near Eastern crisis may be denominated as Kemal's "right bower."

Often, the writer has heard it stated in military and naval circles, both in America and abroad, that the Turk is a degenerate and thus a poor fighting man. This is all bosh. All Moslem soldiers, the Turk in particular, are brave, dashing, and inveterate fighters. They have traditions which are fully as inspiring as any people in the world. In addition they have the words of the Prophet, equally a command and a promise, a shrewd combination of religious zeal and temporal reward, if the Moslem *fights*.

(Concluded on page 13)

"Let Law Go to Hell and Study Judges"

How Courts Illegally Legislate by "Interpreting" the Law

By C. C. DANIELS

of the New York Bar.

ON THE sixteenth day of September, 1893, the "Cherokee Strip" was opened to settlement and became a part of the territory of Oklahoma. Governor Renfrow appointed me county attorney of "L" (now Grant) County, and the duty of organizing the new county fell upon the appointed officers.

The day of "the run" (as the opening day is referred to by "old-timers") was an epoch in the lives of thousands who looked with longing eyes to the opening of the strip as their opportunity to obtain a home.

As it was my desire to do a general practice, in addition to performing the duties of county attorney, my "shingle" as "Attorney at Law" was hung against the wall of the tent that furnished a place of abode, as well as an office for the transaction of business, and was sometimes used as a jail where prisoners were chained up to the tent pole to await trial.

Shortly after the "opening" a man came in my tent office and retained me to represent him in a suit. The right of possession was involved to a quarter section of land which both parties claimed the preference right to enter and acquire title to, and this right of possession was being contested in an injunction suit. The attorneys representing both sides went before the judge of the district, who decided against my client. I thereupon advised him to "maneuver around" until he got in the position of his opponent. This he did, and we went before the same judge upon the same state of facts, with the same parties and the same lawyers, but with positions reversed. The judge, not to be outdone, promptly reversed himself, and decided against my client a second time.

Judges Have More Power Than Congress

RECOGNIZING the autocratic power of the judge to wield the "night stick" of contempt proceedings, I asked if court was adjourned, and stated that if court was not in session I wanted to ask a question. The judge said court was not in session, and I asked him to please tell me how a lawyer could advise a client in his jurisdiction when he reversed himself on the same question upon the same state of facts, between the same parties in less than 30 days.

His answer was not very satisfactory, and the attorney representing the other party said to me as we walked out—"There is one thing you must learn in this western country; let law go to hell and study judges."

During the nearly a quarter of a century that has elapsed since this advice was given me, I have found that the application of the advice is not confined by territorial limits, but that the study of judges is as necessary in the East as it was in the West, and that it is of far more practical importance than the study of law.

Someone has said, "Let me write the songs of a nation and I care not who makes its laws." A wise newspaperman has said, "Let me write the headlines of a newspaper and I care not what you put under them." *But those who name the judges of the nation exert more power than does Congress and all the state legislators combined.* Congress and the legislature may pass the laws, but the judges determine and limit their scope and effect, and often emasculate and change them, so that the lawmakers would not recognize their own handiwork.

Judges "legislate" under the camouflage of "interpretation" upon almost every proposition that vitally affects the public.

The bench, in my opinion, contains the good and the bad—the good by far outnumbering the bad. There are remarkably few judges who are either corrupt or dishonest, and the very few who are corrupt or dishonest are eventually correctly appraised by the people and accorded the sincere contempt they richly merit.

A lawyer, in court, who had been treated with the grossest discourtesy by the presiding judge, started to walk out of court, when the judge railed out at him and said—"Do you mean to show your contempt for this court?" The lawyer politely replied—"No, your Honor, I am going out to keep from showing it." There are times when to retire from court is the part of wisdom and a way of refuge.

Examine Jurors—Why Not Judges Too?

WHEN an intelligent lawyer has for trial a case involving large interests, he carefully scrutinizes the jury list, and hours of the time of the court are spent questioning the members of the panel for the purpose of ascertaining whether or not any of the jurors have financial interests that might affect their judgment in rendering a verdict; their social and political affiliations, and the organizations they belong to; and any other fact or circumstances, calculated to prejudice them in rendering a verdict, are carefully inquired into and considered. Ample provision is made for this examination of jurors, and it is not considered a reflection on a prospective juror to ask questions calculated to bring out the facts.

If the same questions were asked of or concerning the judge presiding at the trial; if questions were asked that seemed to suggest that the judge himself might not be free from prejudice, because of reasons for which the judge would sustain challenge to a juror and decline to permit him to serve—unless such questions were very diplomatically framed, the lawyer would be in serious danger of punishment for contempt. *And yet the judge is the "thirteenth juror" rendering the verdict.*

In an address delivered some time ago, a New York Federal Court judge solemnly warned the members of the bar against criticism of judges, and intimated that one who indulges in criticism of the judge was an enemy of society, engaged in tearing down the bulwarks of civilized government.

The placing of the judicial robes upon the lawyer who has been the trusted attorney of crooks and scamps and who has exerted his brain in enabling dishonest men or corporations to secure property and money that in good conscience they were not entitled to, or to escape liability for contracts that common honesty demanded they should meet—*does not change that lawyer's character.*

It is true, however, and very pleasant to record, that the responsibility and dignity of newly acquired judicial position often brings out in men who go on the bench a latent capacity and integrity that their closest friends did not realize they possessed.

There are others who go on the bench and yield to the seductive effect of flattery and power, to the astonishment and disappointment of their closest friends, who believed them to be immune from such influences.

Judges who actually take bribes or who actually sell judgments are rare specimens. There are many on the bench—and by far the larger portion—who bring to the performance of their godlike duties, keen intellects, intense application, learning, courtesy, courage and integrity. These men do not mind intelligent criticism. They recognize that the good judge must bear some of the odium of the bad; that when the judicial robe is treated as too sacred to permit the average man to use his intellect in appraising what the robe covers, the robe may sometimes be used for purposes that arouse criticism.

The judge who attempts to force jurors to decide questions of fact, of which they are the sole judges, in accordance with his views, is himself guilty of contempt of court—for the jury is as much a part of the court as is the judge. Jurors are not responsible to the court for the exercise of their honest judgment on facts submitted to them, and when the judge invades their sphere and attempts to control the exercise of their conscience, he deserves the censure of all law-abiding citizens. *Of course there is no machinery provided for the punishment of the judge when he shows contempt for that portion of the court represented by the jury,* but he is morally as guilty as those the court punishes for contempt of that part of the court represented by the judge.

It is well to begin the study of judges years before they are appointed or elected. If an X-ray could be taken of the processes utilized by those who control the appointment of Federal judges, the student of public affairs would learn something of the care and scrutiny exercised to make certain that the views on public questions entertained by the man under consideration are *in harmony with those who control the appointment.* A most careful analysis is made of all that the prospective judge has written or said; his speeches, briefs and decisions (if he has been on the bench) are carefully scrutinized for the purpose of ascertaining not only his character, reputation, capacity and fitness, but also whether he puts the emphasis on property rights or personal rights.

Appointing Senator White

DURING the administration of President Taft, a vacancy occurred on the United States Supreme Court bench, by reason of the death of Chief Justice Fuller. The opportunity was presented to President Taft to name the man who would sit at the head of the court which exercises more power than any court in the world.

President Taft determined that the man designated by him for this exalted position must be a man of unblemished character against whom no breath of scandal had ever blown; that he must have pre-eminent ability; be a vigorous thinker whose training and capacity would command the respect and esteem of the world. He found those qualities in Associate Justice White, and appointed him Chief Justice.

But there were others who possessed these qualities and we must look for other reasons moving the President to designate one who had been a lifelong Democrat and who had been a soldier in the Confederate Army.

President Taft knew from Senator White's record that there was little danger of his judicial opinions being out of accord with the Republican policy of a protective tariff, and that, therefore, from the Republican standpoint, he was "safe and sane."

The Sherman anti-trust law was invoked in the Northern Securities case. There was a division of the court of five to four. Justice White was one of the dissenting judges who insisted that the court should do what Congress had refused to do and write in the act "unreasonable" restraint of trade, thereby emasculating the law and changing it from a "rule of action" to a mere declaration, depending for its force upon the conviction or bias of the particular judge before whom the case should come. The five outvoted the four, and the law was sustained in its integrity. The court upheld the Constitution which provides that the executive, legislative and judicial departments of the government shall be separate, and that the Congress of the United States was the legislative body, and that duty had not been transferred to the courts.

When President Taft came to consider the appointment of a man to succeed Justice Fuller as Chief Justice of the United States Supreme Court, he had every reason to believe that Justice White would do his best to write into the Sherman anti-trust law words which would weaken, if it did not destroy, the law; that Justice White was committed to the policy of *judicial legislation* and sought so to change the law as enacted by Congress as to remove the menace from combinations and trusts in their ruthless work of destroying competitors and thereby reap a rich harvest from the destruction of individual effort.

President Taft appointed Justice White Chief Justice.

The Sherman anti-trust law came before the United States Supreme Court in 1911 in the cases against the Standard Oil Company and the American Tobacco Company.

It was my good fortune to hear the American Tobacco Company case argued. Chief Justice White, as I recall the incident, asked Assistant Attorney-General MacReynolds (who has since filled the office of Attorney-General of the United States and is now one of the justices of the Supreme Court) whether he would write into the law "unreasonable" restraint of trade. Mr. MacReynolds replied that he would neither add to, or take from the law as passed by Congress.

The opinion in these two cases was rendered by Chief Justice White, and he wrote into the law the "rule of reason" which is another name for "unreasonable" restraint of trade which he endeavored to write into the law in his dissenting opinion in the Northern Securities case. The opinions in the Standard Oil and American Tobacco cases are vigorous, able and denunciatory of the methods used by these trusts. They paint a vivid picture of the ruthless destruction of competitors and the denial of the right of others to do business. But with all the harsh and denunciatory language, the judgment of the court destroyed the certainty and efficiency of the law, gave the trust immunity for the past and made it clear that the only thing trusts and illegal combinations need do is to "study judges" and see to it that the judge before whom Sherman anti-trust law cases come are "safe and sane."

Why Justice Harlan Dissented

JUSTICE Harlan wrote the opinion of the court in the Northern Securities case in which the court "construed" the law as enacted by Congress, and refused to "legislate" under camouflage of "interpretation." He wrote most vigorous dissenting opinions in the Standard Oil and Tobacco cases, in one of which, among other things, he said:

"This court is asked to do that which it has distinctly declared it could not and would not do, and has now done what it then said it could not constitutionally do—*It has, by mere interpretation, modified the act of Congress, and deprived it of practical value as a defensive measure against the evils to be remedied.* The court intends to decide that its deliberate judgment, 15 years ago, was not in accordance with the 'rule of reason.' I have the authority of this court for saying that such a course of proceeding on its part would be 'judicial legislation.'"

Congress has recently provided for an increase in the number of Federal judges, and the President will have the appointment of more than 20.

That the Department of Justice prefers taking its special cases before judges who have been recently appointed by the same power that named the Attorney-General, is a fair inference from the fact that the Attorney-General made his application for injunction in the recent strike troubles before Judge Wilkinson, of Chicago. Judge Wilkinson had until recently been officially connected with the Department of Justice, and those who pass on and recommend for appointment as judges, had every opportunity to study Mr. Wilkinson. It was their duty to do so before he was appointed judge, and there is reason to believe that they were satisfied that the Department of Justice could draw a correct conclusion as to the way he would view questions raised in the application for injunction. Evidently the Attorney-General made no mistake in his "study" of Judge Wilkinson, for the judge granted an injunction so broad and far-reaching, that many thoughtful men stood amazed at the lengths to which matters had gone.

Open Session Would Help

IN APPOINTING the new judges authorized by Congress, the President will exert an influence on the life of the nation more far-reaching than any law enacted during his administration. Federal judges are appointed for life, and the people have practically no voice in selecting these important officials. Although these men hold their courts and administer the law, or by interpretation modify or change it; although they protect and uphold or take away and destroy the people's rights, yet the people have no word in choosing them.

If the confirmation of judges was considered in open session of the Senate, the public might have a "look-in," but sessions of the Senate considering nominations are secret, and facts brought out with relation to those nominated for judge are withheld from the public. With so large a number of judges to be considered at one time, it is reasonable to assume that there may be some "logrolling" between the different Senators whose friends the President has designated to fill these judgeships.

I would not have anything said in this article construed as minimizing the duty and necessity of earnest, persistent and intelligent study of the law, but the purpose is to emphasize the necessity of "study of judges" as well as the *law.*

Lest We Forget

IN THE midst of appeals that come from the distant parts of the world—some sections of which are now being better fed on American charity than ever they were fed by their own industry—it is well to remember the suffering, perhaps a keener suffering, which millions are undergoing in those parts of the world for which large collections are not being asked nor taken. Take this for example:

> "The recent continued spell of cold weather, with its northerly and easterly winds, has greatly increased the hardships and miseries endured by the very poor in East London. Children are terribly underfed and underclad. Their fathers seek work and seek it in vain. Their mothers are unable to secure sufficient food and warmth for either their little ones or themselves. The nights are cold and wretched, too, as well as the days, for many homes are destitute of bedding."

Indeed the bulk of household goods which the refugees of various Near or Far Eastern parts are shown by the photographs to be moving hither and thither, would spell wealth for tens of thousands of families in our own lands.

The distress of far-distant lands, however, is amenable to charity—perhaps that is why it is more popular than the distress nearer home. The distress at home will make greater drafts upon us than mere gifts grumblingly flung to appease the insistence of some too zealous collector. The distress of London, and of American cities, too, requires justice to alleviate and remove. And it is easier for us to be temporarily charitable than it is to be continuously just. The shame spot of the world is not the sufferings of distant peoples who have never achieved a settled and productive civilization—the shame spot of the world is among ourselves, among the most highly civilized people of the world. And already heathen Turk and Hindoo are pointing at us and saying, "Physician, heal thyself."

Aiding the Poor Oil Men

IT WILL be impossible, probably, to find an effort on the part of government to curb the profiteering in commodities necessary for general use, except that during the war the prices of farm products were closely controlled. Even then the wildest speculation was permitted in *the finished product of grain,* but it was made a criminal offense for the dirt farmer to hold his crop for a higher price than set for it at Washington.

Taking sugar as an example, the consumer was compelled to pay five or more times the normal price of granulated for an inferior product, under a plea of a shortage, when it finally proved that warehouses were bursting with oversupply. There was not a moment during the war that there was need for rationing or more than a moderate increase in price.

The ability of the authorities to control the grain distribution is evidence of a like power in every case of the kind, and it gives point to prevailing instances of like discrimination in which agriculture is not accorded treatment under which favored interests are benefited.

A dispatch from Oil City, Pennsylvania, announces a new ruling by the Federal Reserve Board, by which producers may store their oil until a favorable market and at the same time enjoy *the use of half the money investment it represents.* Storage certificates are changed in form to warrants issued by the pipe line and storage companies, and member banks are permitted to loan the holders up to 50 per cent of these warrants, which the Federal Reserve banks will rediscount with *currency issued and guaranteed by government,* in the name of the Reserve Bank. The Pennsylvania Oil & Gas Association, which made the announcement, is naturally elated.

For many years agriculture has begged for a system of storage by which at least a part of the money value of the crops might be available for immediate use, but it has never been granted, yet here is the exact plan in full force in favor of the oil industry! Moreover, when an emergency gave the farmer opportunity to await a natural rise by providing his own storage, he was told that he must sell at a figure which was out of ratio with other commodity prices which were soaring. This was virtual conscription of property but applicable only to agriculture, just as selective draft was a conscription of men but not applicable to stocks of gold.

Port docks are lined with bonded warehouses, where imports are permitted to remain with tariff taxes unpaid until the importer has found a market and withdraws them. This is but a variation of the practice of government in dealing with Big Business.

To call attention to this new scheme to help the oil industry is by no means to class it as harmful or dangerous. The point is that with agricultural resources as great as this nation has, and with a debt as easily monetized, the practice should be more common and include other lines of commodities. Such a relief to agriculture would exceed all the clumsy loaning possibilities yet created as far as actual practical good is concerned.

Standard Oil needs the accommodation, too, since it recently has been compelled to distribute stock dividends of several hundred per cent, to disperse a cash surplus subject to special taxation because of its size, incidentally saving a tax of millions without reducing cash holdings.

"The Great Gold Myth"

THE truth is gradually seeping through. The following from the pen of St. John Ervine, in the London *Daily Mail,* presents a point of view which is surely spreading across the thinking world:

I remember a year ago, in Paris, being presented with a postage stamp, inclosed in a disc with an advertisement of pills on its back, for change. I remonstrated with the man.

"Surely," said I, "the Republic of France can do better than this!"

He shrugged his shoulders—Frenchmen *do* shrug their shoulders—and showed me a silver coin, the only one he had, which looked as if it had been knocked about by Big Bertha. And yet, despite its lack of gold, the Republic carries on.

Few of us have seen gold coins for several years. There must be thousands of young men and women in England today who have never seen a gold coin. But we survive.

And suddenly I realized that one of the great economic myths had been blown up. We used to be told that the richest nation, the most *secure* nation, in the world was the nation which had the largest gold reserve. The United States is so impressed with this theory that it actually keeps large quantities of unminted gold for emergencies.

But we have now discovered that a gold reserve may actually be ruinous to a nation. The United States possesses nearly half of the total gold of the world, and its unemployment figures are double those of this country!

Mr. Hoover lately asserted that the Allies could pay the whole of their debts to America *in gold.* I doubt it, but if they could and were to do it, they would probably ruin America; *for the gold game is only a good game for so long as everybody consents to play it.* If the rest of the world is content with paper money, then a gold reserve of any dimensions is useless.

But the plain truth, becoming clearer every day, is this, that it is not gold reserves that make a nation rich, but *work.* If every piece of gold we possess were taken from us, we should still retain riches while our people have industry and the will to work. When this fact penetrates the skulls of political economists and politicians a revolution will have been made.

A Wise Judge

IT IS not a new idea that there may exist an irreconcilable difference between the administration of *law* and the administration of *justice.* The law ought to be the broadest expression of the profoundest sentiments of justice which inspire our best minds. Of course, the majority of our laws are made without the most distant reference either to our sentiments of justice or our best minds. Anyone with carfare may witness a city government make laws; anyone with more carfare may witness a state legislature make laws; anyone with still more carfare may see the national government make laws; and, after doing so, anyone may say whether the statement just made regarding justice and minds is true.

With admiration, therefore, do we record the appearance of a just judge in California, one who in justice tries to repair a wrong done, without doubling the wrong. A man killed another through careless automobile driving. The verdict was manslaughter. The law ordained a prison sentence. Now, it happened that the man who was killed had a family, and the man who was guilty of the killing had a job. No earthly use could possibly be served by committing the man to jail; to do so would be but to remove one more man from the ranks of the useful producers of the world. Besides, there was the problem of the family robbed of its breadwinner, which problem remained as stark and cruel as ever, not altered in the least by the written law being obeyed as to the imprisonment of the offender.

So the judge, in whom there must be a profound sense of justice, as well as a very good mind, set the law to heal as much as possible the rent made in society, instead of tearing a wider rent by wrenching the man from his job and making him a convict. He said, "You are sentenced to remain on your job and pay this widow and her fatherless children one-half of your wages. Of every dollar you earn for five years, 50 cents of it shall go to help perform the responsibilities of the man of whose death you were the careless cause." The man only earns $5.50 a day, but he agreed. If he is a right-minded man, he doubtless is truly satisfied that he can expiate in a more helpful way than by mere stupid prison life.

There is something about Justice which we haven't yet grasped. Justice does not merely penalize. Justice also sets right, it repairs, restores. It is Justice that the damage should be restored. How much Justice is there in our common codes?

A Farmer's Letter

FOLLOWING is a letter from a farmer, printed here without comment:

"The agricultural chiefs have come and gone, and as Dr. Spillman stated, have found no remedy for the farmers' ills. I am no chief. Am only a common dirt farmer, but I am human enough to know when I am hurt and intelligent enough to know what has hurt me. This year it has been the government crop reports. I was ready to dig my potatoes in July. The price was around $1.25 a bushel. I had a good crop and thought I was assured a profit, but on the 10th the government report came out, showing 440,000,000 bushels, and the price immediately dropped to 40 cents, and has been around this ever since. There were no glutted markets, nor could there have been until October, when the bulk of the potato crop is marketed. The government report and nothing else killed this crop. On November 13 the Minneapolis *Journal* published a forecast from the University of Minnesota, which stated that for the last 20 years government figures on acreage of potatoes have been worthless. It would seem that they are entirely worthless, for report of October 27 gives shipments from Minnesota and North Dakota as 6,029 less than last year, and from all the northern states as 13,000 cars under last year at same date, and yet the price is less than one-half that of last year. If the papers would put on a good big campaign to stop those government guesses it would do more good to the farmer than anything else. Let the government publish one report, and that when the crop is marketed. Change Federal bank rules so that long-time agricultural paper can be rediscounted. Preach to the farmers that if they will seed down 10 per cent of their plow land, they will reduce wheat yield 80,000,000 bushels, oats 140,000,000, corn 300,000,000, potatoes 40,000,000, and so on, and will receive more money for the 90 per cent acreage than now at full 100 per cent of their land. They can all use a little more pasture and hay land to good advantage.

"If you will broadcast this program you will receive the everlasting thanks of the farmers, and should have that of the business men, as well."

Mr. Ford's Page

IT HAS always been a hope of the people that when elections change the personnel of the officeholders, the condition of public affairs will also be changed for the better. Hence, for many years the energies of the people have been mobilized at intervals to get one set of people out of office and another set of people into office. And each change has been heralded by prophecies of the good it would accomplish, which prophecies have gradually melted to protests, and another hopeful turning to the next election.

In England they have had quite an overturn and multitudes of people were cheered. There is still pathetic faith that a political overturn infallibly means economic and moral improvement. The pathos is not in the faith—it is undoubtedly possible that removing political hindrances and using the power of the government to abolish the pressure of injustice upon the people, great public good could be made to flow to all classes—the pathos is in the fact that this faith is so often disappointed. In England the hopefulness was somewhat checked when the people looked up and saw that the new government coming back was really the old government that went out. The new faces were surprisingly few.

IT IS not at all certain that the newly elected Members of Congress were chosen to make new laws. It is quite possible that they may have been chosen to unmake some of the laws that exist. What an immortal Congress that should be which would adopt the policy of undoing all the laws which in any way permit the practice of any privilege which bears heavily upon the plain citizen. We don't need laws to prevent our troubles; we need the repeal of laws that permit our troubles. Most of our oppressions are legal—they have been legalized by laws passed permitting them. New Members need not be too anxious to learn how business has always been done at the seat of Government. Let them learn how it ought to be done.

This, of course, is explainable as far as England is concerned. The election was held to decide, principally, a question of leadership. A partnership of parties had dissolved, and the question was, which party should be regarded as leader. This was very definitely settled, but it did not involve the bringing of new men into the work of government. As a consequence, many are wondering whether the affairs of the common citizens will be improved. It is only in the degree that politics has hindered the life of the common citizen that he expects politics to help him: and the intensity of his expectation indicates the degree of the hindrance.

American elections are somewhat different. More new men enter American official life at any one of our elections than appear in England in 20 years. Take this year's election; it has projected into important office hundreds of men who have had no experience of office at all, not even minor office. Farmers, workmen, business men, professional men, many of whom were candidates only as a protest and with no expectation of being elected, these are the types which every year, and especially this year, make their bow to public life.

This, of course, is always creative of hope among the people. They have a faith that the new man coming in will never lend himself to the games which the man going out has played. This hope is what it ought to be. Our election system, our devices for bringing the will of the whole people to bear on the personnel and policies of government are ground for such hope. The persistence of the people's belief in the good purpose of our American institutions is a wonderful fact to contemplate. In spite of the manner in which the purpose of these institutions has been thwarted, the people still believe in them. And their belief is evidence that American institutions, unshackled, and let to work, and used to the utmost, are sufficient for all our problems and for all our needs. One of these institutions is the Election; another is the Constitution, in the letter and spirit of which the elected men are supposed to work.

For a long time in this country elections did not mean much. The Invisible Government had always two sets of men—the public could take their choice. The Invisible Government supported and governed both parties—the public could elect either, as they chose. It will be worth billions of dollars in actual cash to the plain people of the world when they discover how readily the Invisible Government allows them to organize to propagate any idea whatsoever. Let the Conservatives organize. Let the Progressives organize. Let the Radicals organize. And then subsidize them all—that is what the Invisible Government does. And while the parties are arguing it out, and voting it out, it is the Invisible Government that always wins. It won principally because of the pathetic faith of the people that voting one set of men out and voting another set of men in, made a material difference.

But it is beginning to dawn upon the people, and that dawn is rising with marvelous swiftness, that the change must be deeper. The same set of men, moved by a better purpose, might do just as well as a new set of men, if it were not for the testimony of experience that men who have become the servants of one motive are not easily made over into servants of another. Hence, our people have been choosing not merely a new set of men but new men with new or better motives.

The danger which besets the new man in office is that he comes into an atmosphere of tradition. If a man goes to Congress, for example, he feels that he can best put in a part of his early months in learning how Congress does things. He wants to learn, very probably, in order to do things just that way. Now, unless Congress has shown itself to be a model of expedition and an accurate servant of the public will, there may not be much good in learning the past processes of that body. And then again it may be very much worth while to learn from the accumulated experience of that body. The point is that the new man enters into an atmosphere of tradition and is likely to become a member, and only a member, of what exists independently of him. There is a sense in which the Country and the Constituency cease to be the thing, and the Body which the newly elected candidate enters becomes Everything. There is a sense in which a man may become merely a Member of Congress and not a Member of his own District back home. That is, the great thing may be Washington, and not Homeville. A man may be more overcome by the thought of where he has been elected to, than where he has been elected from. It is this which supports the wrong traditionalism of the Invisible Government; it is this which explains the futility of so many good men in Washington. The Government ceases to be Select Citizens and becomes a System.

Perhaps there has been a beginning made this year in the work of selecting men who will not be muffled by the atmosphere of Washington, who will not be content to be carefully ushered through their terms as if they were guests at a funeral. Maybe they will not know as much about procedure as some of the stately servants of the Invisible Government who have preceded them; but this possibly will not make much difference, because "procedure" may be reversed.

We have been passing laws and passing laws for generations. Suppose that there convenes a Congress which deliberately adjourns the business of making laws, and takes up the business of undoing some of the laws that never should have been made.

Let this Congress, for example, pass a law giving $50,000,000 a year to speculators who don't know enough about their own business to run it profitably—and the next Congress will recall the law and the $50,000,000!

It can be done. The regrettable thing is that there is not enough of that kind of legislation—legislation that will legislate wrong laws off the books.

Most of our national troubles do not arise because there are no laws to prevent them; they arise because there are certain laws which permit them. And when our people trace their troubles back to the laws that permit them, then such laws can be abolished. It can be done. It is very likely to be done, for there is nothing more direct than the mind of the common people once it sees the path between two points.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Parcel Post—A Mere Failure or a Sheer Fraud?

Set Up for Farmers, Service Costing Millions for Townspeople

POST OFFICE Department officials used to take pride in a picture of a western bank building that was transported, in packages of building material, to its present site by the parcel post. When they found that certain western mine owners were using the parcel post for transporting raw ore and discovered a shrewd Arizona farmer who was using this government facility for delivering baled háy to far-away customers and gave careful scrutiny to statistics bearing on the distribution of all parcel post mail, they were rendered less prideful. Those figures indicate that, excepting as an incidental convenience, the parcel post has proved to be nearly everything but what was claimed for it by its promoters. This may be due to mismanagement, as many of its partisans claim. But the 10 years of parcel post operation to date show quite clearly that extensions of governmental activity do not always work along the lines which theory lays out for them.

By ROBERT KENTON

JOHN SMITH, Ohio farmer, markets some of his products through the parcel post. He sends a ham, let us say, directly to a purchasing consumer in one of the big cities. When he ships that ham, properly packed, he is required to pay so much a pound for its transportation and delivery to his customer, the charge depending, generally speaking, on the distance between the two points.

The government's biggest item of service in connection with the delivering of that ham is railroad carriage. It is transported along with other mail in a railway mail car, which is rented on a space basis from the railroads. Thus the government collects for transporting that ham on a basis of weight but pays for its rail transportation on the basis of size.

The singularity of that operation may be illustrated by drawing a parallel between the parcel post handling of that ham and a similar handling, say, of the farmer's wife's annual spring hat. She purchases it by letter, let us say, from a merchant in the same city to which the ham is sent. The merchant when shipping it pays postage on a basis of weight and the government in transporting it pays the railroads on the basis of space.

Now there is considerable difference between a cubic foot of ham and a cubic foot of feminine headwear. In truth, the amount of ham which could be stacked in the same space that a dozen boxed-up women's hats would fill should return in postage from 10 to 50 times as much as would the hats. Other costs, as well as risks, of handling the hats naturally are much greater than in the case of hams. If the shipper protects himself against risks, he pays for it on the same value basis in either case; parcel post insurance on $10 worth of ham is the same as on $10 worth of hats.

"I have seen hats for carrying which the government received $5 occupy space in a railroad mail car for which the government paid $50," a former employe of the Post Office Department told the writer recently.

Yet, despite such a contradictory system of charging and paying, Post Office Department officials at times have been bold enough to say that they could tell what it costs the Federal Government to operate what is known as the parcel post. There have been some who made announcements, in concrete figures, of profits on parcel post.

What's the Cost? None Knows

IT IS virtually impossible for anybody to tell what the parcel post branch of the postal service costs. But most students of the subject now declare that it costs considerably more than it returns to the government. Representative Steenerson, chairman of the House committee on post offices and post roads, has been quoted as saying that the government's losses on that branch of the postal service's operations are as much as $200,000,000 a year. Other authorities have placed the loss at from $60,000,000 to $100,000,000.

"It is my opinion that the parcel post by no means pays for itself," declared Will H. Hays, while Postmaster-General. The Post Office Department during the last several years has paid out from $60,000,000 to $140,000,000 more than it has taken in for all postage. The operations of the department now cost about $600,000,000 as against about $240,000,000 in 1912 when the establishment of the parcel post was authorized by Congress. The increase in total costs is not due alone to the parcel post branch of the service. Salaries have been increased considerably, as well as the rates paid the railroads for hauling the mails. And there hasn't been increase in the number of employes correspondingly with growth in postal business due to the parcel post. The deficits of recent years may or may not be due to losses on parcel post. It is well to remember that, though nearly everything else has gone up, all postage rates are practically the same as before the war, while most postal costs have increased. However, it is not disputed that most classes of mail pay their own way; in fact, first-class letter mail always has more than paid its way. The biggest losses no doubt are on fourth class, or parcels. These are made up for through the absorption of profits earned on other classes or directly out of the United States Treasury, through which all taxpayers have to take care of annual deficits in postal revenues.

It is very evident that the parcel post as now operated by the government is not a financially profitable venture, whatever it may have been during some of the years past. Its aggregate losses comprise a subsidy. To whom? That will be discussed later. It is needless, almost, to state that the venture was not undertaken for money-making purposes. Its purpose was to provide a transportation and distribution facility that its sponsors claimed would be of general benefit. It was to lighten the heavy hands of the express companies, which in a measure it has done. But the prime reason for its establishment was to give the farming population an easy medium for buying by mail in the big markets and for selling farm products directly to consumers. It has been and still is used for both purposes, but to an extent so small as to prove it, as an aid to the farming population, a ponderous failure, if not a palpable fraud.

There are now transported annually via the parcel post approximately 2,500,000,000 packages. This is about five times the number handled by the American Railway Express Company, which controls most of the private express business. But a comparison by weight would show up better for the express company, as the average package handled by it is much larger and heavier than that handled by the postal service. When the last statistics were collected by the Post Office Department the average weight of packages handled by the parcel post was only a little more than four pounds. A year before it was only a little more than three pounds. Up to 1916 the average never reached two pounds. The parcel post, it might be said, handles most of the small packages, while the express companies handle most of the large ones.

But the most astonishing fact disclosed by Post Office Department statistics have to do with the origins and destinations, the distribution, of the immense number of packages handled by the parcel post. They show that this facility, established and operated at great cost to the general public ostensibly for the benefit of farmers and the ultimate consumers of farm products, is predominately a medium for business between urban communities.

The statistics have been collected regularly through an elaborate system of counting and weighing carried on for several years during the first half of each April and October and lately in October only. At the 50 largest post offices, the ones at which more than one-half of all postal revenues are collected, all parcel post packages handled during those periods are checked up in full detail. The same is done at a sufficient number of other offices, second, third and fourth classes, to afford data for estimates of the entire parcel post operations of the postal service.

During the first half of October, 1920, when the parcel post appears to have reached the highest volume attained during any counting period now of record, there were mailed in all post offices a total of 55,352,860 packages. More than two-thirds of them originated in the 50 cities that have the largest post offices. In all first and second class post offices there were mailed 51,372,038 of those packages. From the third and fourth class post offices, through which the bulk of farmers' mail clears, there were dispatched only 3,950,822 of those packages.

Now let's see where the packages went. More than 10,000,000 of them, or one-fifth, were delivered to patrons of the 50 largest post offices. Nearly one-half of them were handled by city delivery agencies of city post offices, that is, beyond all peradventure of doubt, actual city residents received them. Other statistics show that of the others only a small percentage went to actual residents of rural communities.

Only 10 Per Cent to Farmers

THOSE statistics—special ones of the kind—were collected in July, 1920, during which month all classes of mail handled on rural routes were counted and the figures consolidated. Those figures showed that only 22,822,562 pounds of parcel post mail was delivered on rural free delivery routes during that month. This would mean that approximately 275,000,000 pounds of parcel post mail went to rural free delivery routes that year. The total weight of parcels mailed that year was approximately 3,400,000,000 pounds. This means that only about eight per cent of all parcel post mail went to the nearly 30 per cent of the population served by rural free delivery—the ones for whose benefit the parcel post was especially established. During the same period the rural free delivery patrons dispatched only 3,698,625 pounds of parcel post mail. If that month were fairly representative of the year, the figures mean that at the highest direct-from-the-farm products have constituted only from one to two per cent of all the parcel post carried by Uncle Sam's postal service.

At best not more than 10 per cent of the services rendered by the government through the parcel post reaches that large element of the population for whose special benefit the services are provided.

The rural route figures were gathered at the end of a long campaign, abetted by the peculiar conditions of the time, on behalf of "farm to table" distribution by farmers through the Post Office Department. Later figures indicate that the present divergence is even greater than it was in 1920. The October, 1921, statistics show that parcels mailed at fourth-class post-offices fell off one-fourth as compared with the October of the preceding year, and totaled less than one per cent of all parcels mailed at all post offices.

Hence as a medium for escaping the exactions of middlemen the parcel post has been of virtually no aid to farmers as a whole. Here and there no doubt some have built up successful mail order businesses in food products; it is evident that the number of those individual cases has grown smaller. For buying from the big markets, the parcel post has been of greater service, than for selling, to the farmers. But even there it has been of inconsequential service as compared to that rendered by it to urban residents—not in buying directly from the farms but in purchasing chiefly from mail order houses in cities other than those in which they live. While, no doubt, savings have been achieved by both urban and rural people who have used the parcel post in buying things they needed, it still is impossible to point out a single important product, of either farm or city store origin, whose distribution on the whole has been simplified or lessened in cost by the parcel post. Unless reductions in express rates, which perhaps were brought about through the establishment of government competition, may be so classed, one cannot point to a single benefit to all the population produced by this expansion of Federal Government activity. Of course, the parcel post is an incidental convenience occasionally to most people, as when dispatching Christmas gifts. But to the public generally it is an incidental convenience only and not a facility that simplifies and improves the daily economy of existence, as was expected of it. If there have been any savings on the score of reduced express costs, they were absorbed, at least very largely, by indemnities paid the express companies during the several years they were operated with the railroads by the government. Moreover, express rates could have been controlled, as they now are, by regulating agencies like the Interstate Commerce Commission.

Mail Houses Benefit Most

IF AS an incidental convenience it is worth its vast cost then, of course, it is a success and justifiable. But even there the beneficiaries, chiefly urban residents, derive undue benefits, for the cost has to be borne equally by the farmers who use it in far less ratio than do urbanites.

But the great beneficiaries are not city folk as a class or those individuals who make more or less regular use of the parcel post in buying and selling. They are those persons engaged in the specialized form of merchandising, known as the mail order business. The parcel post cost is little more than a public subsidy granted to that form of business, especially so when the business is carried on by expert methods on huge scale. Scarcely any other form of business activity has so increased in both volume of transactions and in earnings since the parcel post was set up as that which is typified by the big mail order houses.

In 1911 the biggest of the mail order houses did a business of $66,867,783. By 1916, with three years' operation of the parcel post, its business grew to $146,838,507; in 1919 its gross revenues reached $233,982,584. In 1911 its profits were $6,984,967; in 1919 they amounted to $27,920,416. In addition to regular dividends of from seven to eight per cent on common stock, the company declared a stock dividend of 50 per cent in 1915 and another of 25 per cent in 1917.

The business of another mail order house grew from $39,725,712 in 1913, the first year of the parcel post, to $62,044,336 in 1916 and to $101,745,271 in 1920. Net earnings rose to $5,094,170 in 1919.

Many other big mail order concerns experienced similar growth in business and as large increase in earnings, proportionally, as these two cited. Hundreds of smaller ones, ranging from little establishments dealing in single articles to great distributing stores like those operated by the leaders, were established under the beneficent egis of Uncle Sam's liberality in the matter of transportation of goods.

No doubt they deliver goods, as a rule, to consumers at prices below those of the average retail stores, but despite the vast growth in their operations there is no evidence anywhere that they have affected in the least the general price levels. In the matter of price the mail order house has an advantage over the ordinary retailer even without the aid of a public subsidy. This is shown by the big development which took place in that class of business even before the parcel post was given it as an aid. That development proves that the mail order house needed no subsidy from the government to enable it to perform its undoubted valuable part in the national economy.

Unfortunately, no figures are available to show where the parcel post sales of the big mail order houses are chiefly distributed. It is generally assumed that they go in the main to rural and small-town residents, but that assumption certainly is not borne out by the Post Office Department figures.

The failure of the parcel post to produce the benefits that were expected of it is admitted by many of its most ardent advocates. Some of them claim that it is owing to inefficient management, which, no doubt, in some part is true.

The biggest one, perhaps, is contained in the fact that though the government has operated this big business now for 10 years it has made no mechanical provision for carrying it on, except where such simply had to be done. In other countries where there are parcel posts like ours, special cars and special means of collection and delivery are provided generally for handling the business. Our Post Office Department still endeavors to carry the parcel post virtually the same as first-class mail or printed matter is handled.

The most extended investigation ever made of the subject is now being conducted into all branches of the postal service. It is being made by a joint congressional committee and the Post Office Department.

"Every Day in Every Way I Am Getting Better"

A Visit With Emile Coue, Founder of French School of Autosuggestion, Whose Slogan Is the Rage and Whose Teachings Are Restoring Many to Health and Promise to Revolutionize Education

By PAUL TYNER

A STRIKING vogue has been attained by the method of psychological healing taught and practiced by Monsieur Emile Coué, of Nancy. In almost every city in Europe it has come to be almost a habit for friends to greet each other smilingly. with the question: "Have you done your Coué this morning?" or even less formally, "Have you Couéed?"

Instead of the conventional, "Very well, thank you," it is not unusual to hear in reply to the greeting, "How are you?" on the street or at the breakfast table, "Every day in every way I am getting better and better," intoned with distinct emphasis.

When I was in London everyone was talking of the "miracles" performed by M. Coué during his week of lectures and treatments earlier in the spring. Learned psychologists of the universities were warmly discussing pro and con the Coué "method." The papers were full of him and several books upon the man and his method were published. Such lively interest was roused in my mind that I then determined to take an early opportunity of journeying to Nancy to observe M. Coué's work at first hand and if possible have a talk with the man whose methods, in the opinion of many, "are destined. in conjunction with the teachings of psychoanalysis, to effect a renovation in psychology, medicine and education."

Arriving at M. Coué's home on the Rue Jeanne D'Arc, a stone's throw from the Nancy Passion Theater and passing through the little garden surrounding his modest domicile, I crossed a path which led into an inclosure lined with flowers and shrubbery, one corner of which was occupied by what might once have been a stable or garage, but which was now a pavilion. It was not yet 9 a. m., but people were coming from all directions; some afoot, others in taxis or private motor cars, some in wheel chairs or on crutches, helped in painful progress by friends or relatives. The large upper room of the garage was already well filled and some were sitting on the stairs while others waited their turn seated on benches and chairs in the garden.

Coué's clinic was already in full swing. He is a typical Frenchman, chubby, and comfortable looking, of medium height, clear complexion, bright twinkling black eyes and, despite his nearly 70 years, shown in white hair, mustache and imperial, alert and active in his movements. After a brief preliminary talk, which could hardly be called a lecture, he outlined the underlying principles on which he has steadily and surely built up the practical methods of what is coming more and more to be called the "New Nancy School"—this in contradistinction to the older school of suggestion which made Nancy and its university world-famous and which has for more than 30 years been identified with the names of Liebault and Bérnheim.

Coué's system is simplicity itself. It consists in bringing the individual into realization through actual demonstration in practice of autosuggestion as a force as old as the world and one inherent in all of us—a force of incalculable power for good or evil.

"Autosuggestion" is defined as "the realization of an idea in the subconscious mind."

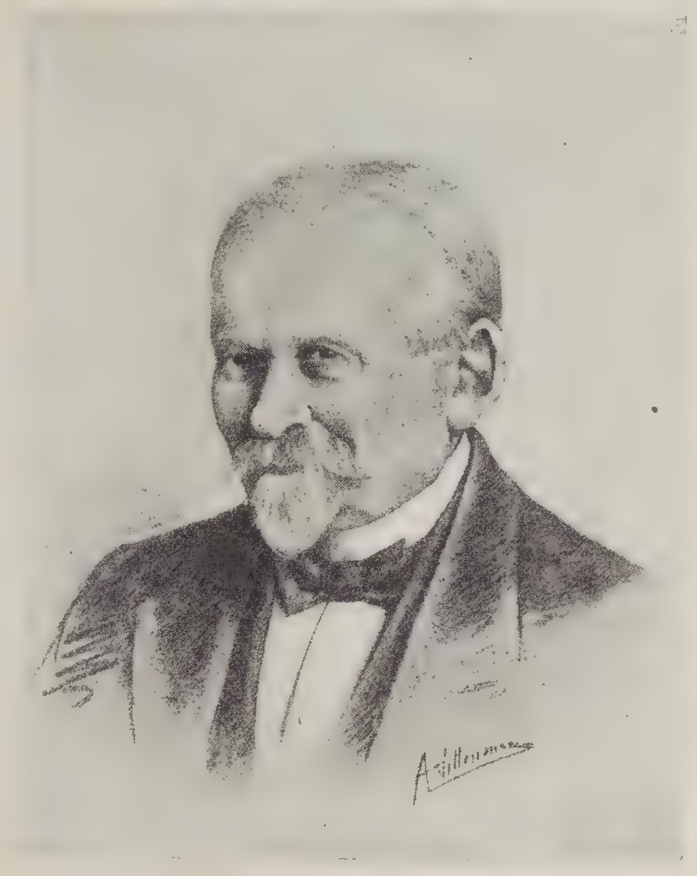
We are all practicing it consciously or unconsciously all the time in every word we utter and every thing we do.

Autosuggestion, according to Coué, is based on the fact that in every man there exist two distinct selves, both intelligent. One is conscious and the other unconscious or subconscious. These selves are not in opposition to each other, but are complementary. They differ not in one being "good" and the other "evil," but rather in the fact that one is *conscious* and the other *unconscious*. Just because the subconscious mind, or self, is unconscious it generally escapes notice and with most people fails to receive the recognition that is its due.

Coué is unique in the position that it is through the *imagination* and not through the *will*, that this unconscious or subconscious mind, which presides over the functioning of the individual organism, is also the active and dominant agent in *all our actions* of whatsoever nature. In this, he challenges and controverts practically all the teaching of the psychology of our day. In fact, he declares that all the voluminous popular writings that emphasize *the cultivation of the will* are mistaken and mischievous. The dictionary definition of will as "the faculty of freely determining certain acts," he insists is utterly false, the will we so proudly boast *always yielding to the imagination* when the two are in conflict.

In a little talk I had with Coué privately in his garden seated under a tree, he very quietly and surely called my attention to certain familiar facts of everyday experience and observation that support this seemingly paradoxical attitude. Lay a 12-inch plank 30 feet long on the ground, and almost anyone would easily walk from one end to the other of it without stepping off. But if this plank is placed at the height of the towers of a cathedral, few would be capable of advancing even a dozen steps along it. Before one had taken the third step one would begin to tremble and in spite of every effort of the will one would certainly fall to the ground. You *imagine* that you cannot advance, and you cannot; that you will fall, and you do fall. Vertigo attacks persons at great heights because of the picture created in the mind of falling, and this picture transforms itself into fact in spite of all the efforts of the will. Moreover, all the efforts of the will only intensify the tendency to fall, and the more violent and strenuous the efforts of the will, the quicker do we bring about the very *opposite* of the result desired.

Another familiar illustration of this "law of reversed effort," which is Coué's immensely important contribution to the great realm of our knowledge of applied psychology, he points out in the case of a person suffering from insomnia. If the sufferer makes no effort to sleep, but lies quietly in bed simply thinking that he is going to sleep, he will soon go to sleep. If, on the contrary, he tries to force himself to sleep by an exertion of the will, he will remain awake, and the more he *tries* to sleep, the more restless he becomes.



EMILE COUE

Have not most of us noticed that the harder we try to remember a name or date or quotation that we have forgotten, the more it eludes us, until at last we give up trying to remember and substitute in our minds the idea, "I shall remember it presently," for the idea "I have forgotten." Then the name pops up of its own accord without the least effort.

It is to this all-important control of the imagination that Coué leads us through the conscious and practical knowledge and use of the tremendous power of the subconscious mind, by *autosuggestion*.

How to saddle and bridle the unbroken horse of the imagination and break it into carrying us safely and surely to the goal we really desire to reach is the problem which Coué solves simply and with scientific certainty. He tells us: "If you persuade yourself that you can do a certain thing (a thing within reason, of course) you *will* do it, however seemingly difficult or even impossible it may appear. If, on the contrary, you *imagine* that you cannot do the simplest thing in the world, it becomes impossible for you and mere molehills become unscalable mountains. The neurasthenic who *believes* himself incapable of walking even a few steps without becoming exhausted, finds it impossible to walk. We bring all our weaknesses, miseries, and diseases "bad luck" and incapacity, on ourselves through yielding to unconscious wrong autosuggestions; all these ills may be removed by consciously giving ourselves the right autosuggestions. There it is in a nutshell.

Coué's direction HOW TO PRACTICE AUTO-SUGGESTION is as simple as Columbus' standing of the egg on end, and as easy as rolling off a log. Here it is in his own words:

> "Every morning before getting up and every evening as soon as you are in bed, shut your eyes and repeat 20 times in succession, moving your lips and counting mechanically on your fingers, or better on a string with 20 knots, the following phrase: 'Day by day, in every way, I am getting better and better.' There is no need to think of any particular trouble you want to get rid of, as the words 'in every way' cover everything.
>
> "Further, every time in the course of the day or night that you feel any distress, physical or mental, immediately affirm to yourself that you will not consciously contribute to its continuance and that you are going to make it disappear. Then isolate yourself as much as possible, shut your eyes and, passing your hand over your forehead, if the trouble is mental, or over the part affected if it is a bodily pain, repeat with extreme rapidity: 'It is going away, it is going away,' keeping this up as long as it may be necessary. With a little practice, the distress, whether mental or physical, will vanish in from 20 to 30 seconds. In practicing autosuggestion, it is extremely important *carefully to avoid any effort.*"

To return to the clinic of the Monday morning of my visit. Having completed the little talk of which the foregoing forms the gist, Monsieur Coué paused to roll a cigaret with the dexterity of Bill Hart and, lighting it, took a few whiffs with evident enjoyment. Then he turned to one after the other of his patients and in kindly tones and sympathetic gave one after the other individual attention.

"And what is your trouble, Madame?" he inquired of a lady evidently in much pain.

The lady, a newcomer, declared that she was suffering from a raging headache. The trouble had been chronic with her and all ordinary methods had failed to give relief.

Coué smiled sympathetically and passed his hand over her forehead saying rapidly—so rapidly that it sounded like a bit of unintelligible jargon, suggestive in a way of the mumbled *cooing* of a dove—*"se passe, se passe."* Telling the lady to keep on with this affirmation, he passed to a heavy-set man who had come in leaning on a stick and supported by a friend. This man declared that he feared he was a victim of creeping paralysis. He was barely able to move his right arm or leg.

"That is because you *think* you cannot move them," said Coué pleasantly. "So long as you believe that you cannot and tell yourself and other people that you cannot, you will not be able to do so."

The man protested that he did not quite see what his thought had to do with it. There was his limp leg and arm; they had been that way for months and no matter how hard he tried he could not move them.

"An ounce of the right autosuggestion," said Coué, "is worth a pound of effort of the will—a ton of such effort. *The harder you try the more impossible it will be for you, so long as you believe you cannot.* Let me show you that you cannot do what you think you cannot do and that you can do what you think you can do."

And he took hold of the man's hands and joined them with fingers interlocked squeezing them together. "Now," said Coué, "hold your hands together; tighter, tighter. Keep on holding them together tight and think, think hard: 'I cannot get them apart.' Well, you cannot, can you?"

The patient tried till his face was suffused with blood from the effort. "You see you cannot because you think you cannot and the harder you try the harder your hands close. Now *think* (with sudden sharpness) 'I *can* open my hands—of course I can!" And the man quickly drew his hands apart and joined in the general smile.

Coué then seemed to forget him and turned back, as by hazard, to the lady, saying, "How are you now?"

She started. "Why, I am quite well; my headache has quite vanished."

And so he went on around the circle, accompanying his directions and assurances with a pleasant smile, smoking nonchalantly the while. Suddenly he turned back to the partially paralyzed man and told him to lift his arm. The man, a bit shamefacedly, said he could not.

"You can if you think you can; I know you can!" The healer spoke with a tone of absolute conviction. "Now stop trying and think, think hard: 'I *can* lift my arm.' Shut your eyes and don't think anything else. Say it and believe it. Now lift your right arm!"

His eyes still shut, the man slowly lifted his arm about an inch. "Higher!" commanded Coué. "Higher, still higher!" Coué kept on until at last the man had his arm well up in the air. Again the healer turned to other patients with gentle, encouraging assurances and insistent and explicit direction. After a while, he again turned back to the supposed paralytic with suddenness and told him to stretch forth his right arm, having him repeat the action several times. Then he was called

In Phantasmagoria, Where All Things Happen

When the Truant Mind Gets Its Wish, or Encounters Its Pet Horror, Pictures of Imagination Come in Sleep to Satisfy Ungratified Desires

By W. M. HAY

HAVE you ever dreamed of a pink snake with purple feathers on it—and it was after you, and you couldn't get away—an' then—just as the fearsome reptile, every feather erect, was about to seize your bare ankle, you woke up, panting and sweating and ready to swear?

Dreams are funny things—sometimes. Scientists, for obvious reasons, have never had any very secure and accurate data on which to base reasoned conclusions and assured facts about them. In dealing with the dreams of even normal persons, difficulties arise from faulty memory, from temperamental peculiarities, or from previous circumstances either untraceable or not scientifically calculable, such as excitement, fatigue, food or hunger, or the general condition of the health. In the case of the non-normal, such as the neuropathic or hysterical, the blind or deaf, epileptics or alcoholics, the difficulties are infinitely increased. Another disturbing factor is the possibility of telepathic or hypnotic influence, the phenomenon of hyperesthesia, and self-suggestion. Robert Louis Stevenson, in "Across the Plains," tells us that he used the latter method to work out some of his plots.

There is still another reason for lack of dream data—that we have all been snubbed when about to relate a dream. Nobody is interested in the other fellow's dream. We read that Joseph's brethren "hated him" when he told them his dreams. And the man who persists in telling his dreams soon becomes even more of a bore and a nuisance than the proud narrator of his infant's cleverness. So we have come gradually to the opinion that the rest of the world thinks "there's nothing in 'em." We thought there was, but reluctantly, under the force of snubs, we have admitted the rest of the world must be right. And yet—

Dreams Most Often Experienced

IS THERE a man or woman who reads this who cannot, out of all the forgotten dreams, recollect one, at least, that came true, tragically or happily true, a dream that *did* "have something in it"? Granted that 99 were rubbish and humbug, attributable to pickles or a draft, yet the hundredth faced you up to the undoubted fact that life has mystery in it, and that dreams are not its least mysterious element.

Well, you are quite right in your private opinion that dreams are not all nonsense, due to an outraged and insulted digestive apparatus. Herbert Spencer—but wait till I mark down the eight most common abominations met with in dreamland.

1. Not Enough Clothes. This dream is often suffered by clergymen. The cleric suddenly finds himself preaching to a big congregation, and dares not step out from behind the pulpit, for he discovers he has nothing on but a shirt or a coat or even less. The agony comes in thinking how on earth he is to get away when the sermon is over.

2. Back at School Again—back in the dear old insanitary school of years ago. Dressed in Prince Albert coat, with side-whiskers and gold-rimmed glasses, I hear the titters of the boys and girls as I fail to give the capital of Sahara or to spell "sieve." I shrink into nullity, as in the old days, under the terrible glance of the virtuous teacher.

3. Passing an Examination. This dream is closely allied to the last. You find yourself in the examination room. A paper on Integral Calculus is set. On the result hangs the job, the car, the hand of the heiress, the European trip, and everything. And you don't even know what Integral Calculus is or are, can't even spell it without looking—and you've got to pass head.

4. Shy Man's Dream. You hurry to the great music hall, where a mighty throng awaits your coming. You are to play the guitar before that vast expectant assembly. For days the papers have advertised your coming; tonight's the night; and you stand in the wings in utter anguish. How did you get let in for this? You can't figure that out now, the time's too short. Somehow you can't find a flaw in the sequence of events that has brought you to this horrible moment—there you stand, the audience is waiting, and you don't know whether a guitar is played by bowing or blowing. Oh, boy!

Do You "Fly"? Avoid Fresh Bread

5. Flying—Getting tangled up in the phone wires and falling—falling—falling . . . . Very bourgeois, this dream—avoid fresh bread.

6. Facial Operations, that never improve the countenance. You are in Port Said, trying to cash a check to ransom your daughter from the Manchurian bandits who stole her from you in Peru; and the only man who can identify you won't believe it's you, because of that operation on your nose.

7. Pursued—by wolves, bill collectors, relatives, anything. This is an awful dream. Every gate is locked, every road ends in a precipice, every window is 12 stories high, every lane is blocked with overturned vans.

8. Some Unspeakable Folly. What man has not dreamed this dream? You have stolen or murdered or abducted, or sunk your lifetime's savings in a dead concern; or set off the fuse without looking to see if your little son was safely out of the way of the coming explosion; or lost a letter that would forever damn you in the eyes of decent men. What man lives who hath not moaned himself broad awake from this dream to thank God that it was but a dream, that it wasn't true, that there in solid, comforting reality was the bed, the pillow, the clock, and there in his crib the little son peacefully asleep?

Herbert Spencer found in the phenomena of dreams, as experienced by primitive and savage races, the explanation of man's belief in the soul, the future state, and the whole circle of ideas generally associated with religion. The savage, he says, identified dreams with realities. When, in a dream, he saw a person he knew to be dead, he concluded that person was still alive "somewhere." When he woke in the morning, after hunting in dreams, through the night, and yet knew, by his companions' testimony, that his body had lain motionless all night in his tepee, he argued that it must have been his "soul" that had been out hunting. And the souls outside man eventually developed into gods.

Get Your Wish in Dreams

THE Bible is the world's greatest and oldest dream book, and it makes no apology about it. From the vision Jacob had of the angels who visited him in his loneliness, down to the Revelation made to St. John, the Bible consistently represents men as learning various lessons through dreams. The great offer to Solomon was made in a dream; the prophets turned their dreams to good account; and, according to the book of the Acts, it was Paul's dream at Troas that first brought Christianity to Europe.

Dr. Freud's interpretation of dreams is that they always symbolize an unfulfilled wish. Thus, Joseph's dream about his brothers doing obeisance to him was interpreted by them as a reflection of some wicked little thoughts that had been running through Joseph's head.

The argument goes like this: We never get everything we want, and even in all we do get there is an element of unsatisfactoriness. So in even the best circumstances we have a great many wishes that are unfulfilled and are likely to remain so.

But imagination comes to our aid and gives us what reality refused. In our daydreams we see ourselves achieving the impossible, conquering the unconquerable, attaining the unattainable, and playing Jack the Giant-killer very creditably. The poor man is washed, the blind man sees, the rejected lover is no longer checked, the rejected poet *is* checked. In fact there is no wish so absurd, no longing so unreasonable, that imagination is unable to satisfy it.

This tendency to satisfy with pictures of the imagination the desires that reality leaves ungratified—a tendency that plays an enormous rôle in the daily life even of the most prosaic—does not become inoperative as soon as we fall asleep. Cravings and wishes persist from the day and, if intense enough, serve to disturb our slumber with dreams.

Some Dreams "Come True"

THIS theory that daydreams and dreams are quite analogous gets its rudest shock from the familiar fact that most of the things we dream about have no possible resemblance to anything we ever wished for. For instance, your daydream is about a new spring suit. You have thought hard about it, trying to decide on a check or a stripe—then at night you dream about walking down Main street at high noon clad in pajamas and a silk hat. Did you wish for that?

Among the many hypotheses that have been advanced to account for our dream-activities, that of Dr. Hudson, in his "Law of Psychic Phenomena," is very widely held. He maintains that we each possess a dual mind, that there are powers in the soul that lie dormant during our waking hours and only come to their full activity when we fall into that psychic condition we call sleep.

Another theory, not contradictory to Dr. Hudson's, is that the second or dual personality that is involved in some of our dreams is a reality, an intelligence, outside of our own, which temporarily makes use of us as its instrument. Students of hypnotism are well aware that such a use of our physical and mental organs by another will and intelligence is quite possible. But if one person can thus "possess" and use another, there is nothing, in logic or in fact, to deny the possibility of our being "possessed" by intelligences that are beyond the sphere of our knowledge. In fact, it is along this very line that many modern scholars are interpreting the doctrine of the "inspiration" of the prophets and of the Apostles.

But whatever the explanation of dreams may be, and however ridiculous most of them are, none of us can get away from the fact that some dreams "come true"—that is, they actually and very vividly sometimes prefigure events that are yet in the future.

It is said that President Lincoln himself had a presentiment in a dream that some disaster was imminent. On the afternoon of the day on which he was murdered he attended a meeting of the Cabinet. All present were struck by his unusual gravity.

"Gentlemen," he said, "something very extraordinary is about to happen. For the third time I have dreamed the same dream. I dream that I am drifting on a great, broad, rolling river. I am in a boat, and I drift—I drift. But this is not business; let us proceed to business."

A few hours later he was dead. Twice before, the dream had come to him, each time presaging important military events.

Another dream of historical importance is that which foreshadowed the Phoenix Park murders. On May 6, 1882, Lord Frederick Cavendish and Mr. Burke were stabbed to death in Phoenix Park, Dublin, by unknown assassins. On May 3, three days previously, a man in London had a dream that impelled him to warn the authorities that a hideous tragedy was impending in the Irish capital.

This man, it was proved later, had never been in Dublin in his life, nor could he by any possibility have had any personal knowledge of any of the members of the Invincible Society. Yet he drew, from memory, and handed over to the Scotland Yard inspectors, sketch portraits of three men whom he had seen in his dream.

Little importance was attached to all this at the time, but when, nearly a year afterward, the murderers were arrested, the sketches were produced in evidence. They were found to be very fair representations of the countenances of Joe Brady, the man who actually struck the fatal blows, of Tim Kelly, who assisted him, and of Dan Curley, another of the gang, all three of whom were afterward hanged.

The Death of Major Andre

MOREOVER—and this, perhaps, is the most remarkable part of the whole remarkable business—in the dream the plotters were in a room across the center of which ran a partition. This information was placed in the hands of the Crown at the trial, and on it were based certain telling questions that utterly astounded both the witnesses and the prisoners; for it transpired that this partition had actually existed in the room in question at the time the conspirators met there, although it had been removed shortly after the murders had been committed.

The death of Major André, whom Washington had to hang as a spy, was foreseen by a Mr. Cunningham. In conversation with a friend, Mr. Cunningham spoke of the circumstances of a dream he had had the night before which affected him so much that he could not shake off the recollection of it.

He said he was standing in the midst of a forest that was entirely strange to him. Presently he perceived a horseman approaching him at great speed. As the latter came opposite the spot where the dreamer stood, three men who seemed to be lying in ambush sprang up and, seizing the bridle, ordered the rider to dismount. They then carefully searched his person and led him away.

The face, figure and bearing of the horseman made so deep an impression on Mr. Cunningham's mind that he awoke; but, falling asleep again presently, he dreamed that he was one of a throng of spectators near a great city, that he saw the same horseman brought out between files of soldiers, who marched him to a gallows and there hanged him.

Later in the day, Mr. Cunningham was introduced to Major André who was then in Britain, and was horror-struck to discover in his person the very man whose arrest and execution he had witnessed in his dream.

There was an accurate anticipation of events that actually happened within 12 months later, and more than 3,000 miles away.

One That Told of Death

A MULTITUDE of strange coincidences, premonitions and warning dreams come under observation in connection with the late war. One of the most remarkable stories concerns the battle of Loos. The parents of a noncommissioned officer in the Argyll and Sutherland Highlanders had a wonderfully realistic dream which unfortunately proved to be too true. During the night of September 25 the father dreamed that he saw his son charge along with his companions. Right up to the barbed-wire entanglements they went, and here a pause took place. The leader turned to encourage his men, and the father saw him fall quite distinctly, and marked his every feature, but only for a moment. A shell burst where he stood, and presently not a living soul was seen.

On the same morning the lad's mother had a somewhat similar dream. Neither told the other of the dream, fearing consequent anxiety, but both related their experience to neighbors. And when the news came of their son's death it was then they made the disclosures, for his death had taken place during the great charge on the morning of Sunday, September 26.

"Make Reader Cry, Laugh, Thrill, Learn"

Gerald Beaumont Says It Took Double Pneumonia to Give Him Slant That Brought Success

By RALPH PARKER ANDERSON

GERALD BEAUMONT and his daughter.

"KNOW your subject, love your characters, write plainly and sincerely."

That's the advice of Gerald Beaumont, who wrote his first story less than three years ago, and is today advertised by his publishers as "the most successful new writer in America."

Beaumont practices what he preaches. Capitalizing a decade of experience as a sporting editor of a metropolitan newspaper, he entered the field made famous by the late Charles E. Van Loan, and, because he loves his characters, he has given the public an entirely new interpretation of the sporting world. Hitherto, so-called "sporting fiction" has held very little sweetness, romance, pathos or sublimity; humor and slang have been its chief characteristics. Beaumont has introduced a new type of sporting story, stressing the human values in a manner that leads one publication to hail him as the successor to an earlier Californian—Bret Harte, who wrote so unforgettably about the rough mining men of '49.

How successfully he has pleased the public may be judged by the fact that he was on the open market only for a few months before there was an editorial scramble for his work. He appeared in *Leslie's Weekly, Saturday Evening Post* and *Everybody's.* Then Karl E. Harriman, of the *Red Book Magazine,* arranged to supply the readers of that publication with a Beaumont story in every issue for four years, which is quite a record in itself.

Newspaper Cub at $6 a Week

DODD, Mead & Company, New York, has brought out Beaumont's first book, "Hearts and the Diamond," a collection of baseball stories, which was recommended from the pulpit by a distinguished San Francisco clergyman. Appleton & Company will publish "Riders Up!" stories of the turf, this autumn. Other volumes will follow. George Broadhurst, the New York playwright and producer, presented Beaumont's "Wild Oats Lane" to Broadway in September. This play was founded on "The Gambling Chaplain," by Beaumont.

"The Referee," has been picturized and other Beaumont photoplays will follow.

Even England, which formerly has not been partial to American sporting tales, has accepted this young Californian readily. British magazines are featuring his work in republication form.

All this is intended to make you realize that it should be worth while to know "how he did it." He told me recently in his home near San Francisco. Incidentally, it is worthy of note that Gerald Beaumont is still a young man. He was born in London, of American parents, in 1884. His parents returned to America when he was still a small boy.

In his home near San Francisco, he recently told me the story of his writing experience—a story as interesting as any he has written.

"I'm a sort of creature of circumstances," he explained. "In my boyhood I aspired to become a cab driver, a cop or a cowboy, but instead I went to college and emerged with a fine education and no money.

"I broke into newspaper work at $6 a week. My first 'beat' included the town jail, the emergency hospital and the morgue—a sweet atmosphere for a guileless and trusting youth! I spent years in intimate touch with the tenderloin as a police reporter, then graduated to city editorships, and finally switched to the sporting department as a more wholesome, out-of-door field.

Stories Are Largely Fact

"EVEN the sporting department had its drawbacks, for, as the official referee for two fight clubs, I learned what it meant, more than once, to have a mob raining invectives upon my head and calling lustily for my blood. Perhaps that is one of the reasons why I sympathize so keenly with men and women in the sporting world; they are usually 'more sinned against than sinning.' In the business and social world, people speak and act with due regard to custom and convention; we are polite to people we dislike; we say one thing when we mean quite another. Most of us behave artificially.

"But in certain classes of the sporting world, where men and women are unconventional and free of restraint, whatever else their faults may be, you will find them very human. Given the right sort of opportunity, they respond eagerly to the author's tests.

"Strangely enough, I didn't at all appreciate the value of the years I spent in company with ball players, prize fighters, racing men, and all the 'color' to which a sporting editor has such ready access. I considered the time as absolutely wasted, especially when I left newspaper work to serve as a publicity man for a large railroad. It took double pneumonia, and a long period of convalescence with plenty of spare time, to give me the right perspective on all that I had been through. Then I started writing and have been at it ever since." I asked Beaumont the old question about where and how he obtained his best ideas.

"Most of them," he answered, "are actual incidents, or are suggested by actual incidents.

"Often I start from a title alone. Or it may be a colorful phrase which crystallizes an idea in my mind. Again, an unusual character may fairly demand expression in a story."

You may have noticed that most of the Beaumont stories start off with a clever verse. "There's a reason" for this.

"I generally write an original jingle at the start," Beaumont went on, "because it serves for me the same purpose that the keynote serves the musician. I want a poetic concept—a verse which will form the pitch, if I may call it so, to which my story will respond. It also serves to put me in the proper mood.

"When I've selected a subject, I read about it all that I can at the local libraries, and I get various angles from my own notebooks.

Some Beginners' Mistakes

"I LET an idea develop in my mind at least 10 days before I sit down to put it on paper. During that time, my subconscious mind, I suppose, takes charge of the idea. When I start to write, the characters and the story are very real to me."

Beaumont does not advise blind following of old masters. In his own case, he finds that reading dead masters disturbs him, while reading his contemporaries is likely to confuse him in his own style and ideas. One reason he has succeeded is that he has let his own distinctive mannerisms have free rein.

His thoughts about technique are similar. If he follows its rules, he does so instinctively. His stories are too real to him to permit thinking about technical details of story construction.

"Too many writers," in his opinion, "become so immersed in technique that they can't see the human values."

"The greatest mistake made by beginning authors" —and Lord knows that Beaumont is visited by enough of them—"is in what constitutes story material. On this danger point many promising writing careers have been wrecked. The writer thinks that unless he utilizes murders, thrilling adventures in South Africa, and unbelievable experiences, he isn't writing a story. Nothing could be further from the truth.

"The first essential to success in writing is that the author write on a subject he knows better than his readers. Almost always, there's some sport, or business, or type of character that the writer knows more about than the average reader. If he can't qualify there, he can at least go back to his schooldays, or he can write about—himself! Surely he knows himself better than anyone else.

"Unless an author knows the people he writes about, his characters don't ring true. They're puppets—as little credit to the author as to themselves. When you write about people you understand, you can sympathize with them, believe in them, and love them.

"Countless writers gaze off to the horizon for story material, when there's a field rich in possibilities under their noses. They write about detectives, when they ought to be writing about the policeman on the corner. They write about sailors, when they ought to be writing about street car conductors. They write about crooks, when they ought to be writing about clerks. Write about your own ambitions or about your friends and neighbors!"

Beaumont then compressed into one sentence the main reason for his remarkable success: "My formula is to try to make the reader laugh, cry, thrill and learn."

There are probably thousands of men who have had opportunities at least equal to Beaumont's to know the ring, the diamond and the race track. But he is one of a half-dozen men who fully understand the human sides of the men who follow these sports as a business. When you meet him, it's easy to understand that this ability to see below the surface is inborn. Beaumont is a fellow who might best be described as an ideal 'big brother." His kindly eyes, his sensitive mouth, his lack of formality and pretense—all combine to make him lovably human. It would take a mighty big hall to hold all the people he has helped in one way or another.

"Don't overlook the human side!" he emphasized. "The fighter and the ball player have wives and children who mean more to them than the ring or the diamond. The policemen is eight hours on duty and 16 hours off duty. If you must write about policemen, don't take the ordinary things they do because they're policemen. Tell something that a policeman does in spite of the fact that he's an officer of the law!

"When you stop to think about it, you realize that O. Henry followed that policy. He wrote about people exactly like those we meet every day, but he fictionized their human phases that you and I were too blind to see."

To illustrate his points, the author told me about a gambler who had sent eight boys through college, and about a young Portuguese boxer who had to fight tuberculosis as well as pugilists, but who, when the disease finally "got" him, left enough money to support his mother and 11 brothers and sisters.

How He Gets Material

BEAUMONT doesn't get his baseball stories by sitting in grandstands. He visits the players at their training camps. He eats with them at their homes, and knows their wives and children. He chats with everyone from "sub" to manager. When he's near a race track, he has no scruples against getting down on his knees and shaking dice with a group of colored boys. He learns the human sides of the judges, the jockeys and the stable hands.

Does all this pay—this making pals out of the people he writes about? The best answer is to read a Beaumont story. If you don't grin and then feel a lump coming up in your throat, then laugh and finally wipe a tear away—if you don't do these things, then I say, "Go to a doctor," for there's something wrong with you!

That Beaumont's characters are true to life is evidenced by some of the many letters he receives from readers who proudly state that they personally know the original of So-and-So in a late story! One could fairly see the tears between the lines in the letter of one reader who said that his father had been the counterpart of an eccentric old man who lived in the pages of a Beaumont story.

These true-to-life characters are possible only because the author knows his people and because they are vividly real to him. He laughs with them, cries with them, loves their faults as well as their virtues. More than once, he has had to stop writing to take a nervous walk around the block because he felt so keenly the sensations of his fiction children.

"Write about people and things you are more familiar with than your readers are! And always look for the human side!"

How Young America Has Become a Publisher

More Than 5,000 School Newspapers and Magazines Train Pupils

By GEORGE W. GREENE

"SEE Pat Meyers and find out what the basket ball schedule is going to be," commanded the young high school editor. "Write 500 words about it, quick. Make it good, Jack, because we need it for a main story on page one this week."

That doesn't sound like the way you learned English in your high school days, does it?

But more than 5,000 high schools are today teaching English—and many other things—in this manner. School publications, ranging in character from daily newspapers to monthly magazines of professional quality, published in schools of from 39 pupils or more, are a new and interesting development among the youth of America.

"The only way to learn to write is by writing" is an accepted axiom and forms the basis for many English teachers' assignment of themes. But the pupil writes without enthusiasm, because he has to, and grumbles to himself, "Aw, what's it for? Who's going to read it, anyway?"

Compare this with the school newspaper office, with its editor-in-chief, sports editor, society editor, "colyumist," staff of reporters and all the machinery and spirit of a real newspaper's city room. Here there is an incentive to write accurate, interesting English, for companions are near to say, "Good story" and the whole school will soon read his story, printed in his paper.

The student reporter is on his own initiative—"it is up to him" to get and write the story. Everyone is working together for one result. There can be no shirking or the next issue will clearly indicate it. If the paper contains live news and some real humor the entire school world knows it, and treats the staff accordingly. If the paper is full of stall, dull material, carelessly handled, every student reader realizes it.

The rapid increase in school publications during the last few years is largely due to the fact that teachers have been quick to recognize their value. Miss Clara C. Ewalt, Department of English, East Technical High School, Cleveland, Ohio, speaks enthusiastically of such papers.

"English that is to the point, English that is accurate, English that is readable!" is the way she puts it. "A course in news-writing will go further toward realizing this ideal than will any other course in the curriculum. Such a high school problem, moreover, in which the pupils' project is the getting out of a weekly newspaper is the most real problem in English offered in the schools of this country today."

Reporting for the school paper teaches the pupil accuracy. Let him or her make a mistake in an account of a class meeting, for example, and his classmates will make his life so miserable that future errors will be unlikely. Personal honor is developed, for friends will "tip him off" to news he must not publish prematurely. To break his word means loss of his usefulness as a reporter in the future.

On the business side of the publication other pupils are learning by practice the fundamentals of accounting, salesmanship and advertising, for most scholastic publications are self-sustaining. Subscriptions must be secured and papers delivered. The advertising manager and his solicitors must prove that advertising space in their publication is worth real money to the merchant. The era of "charity-advertising" in student publications is nearly over and no foresighted staff can afford to cheapen its paper by letting any advertiser feel that in buying advertising space he is merely "helping the kids out." Pupils in accounting keep the books in order; students in typewriting and shorthand act as stenographers for the editor and other executives.

Many newspapers and magazines are not only edited and managed by the pupils, but are printed in the school print shop by the pupils themselves. Here again the paper or magazine is an advantage. The very fact that the publications will be read by the whole school makes each "printer," "make-up man," and "pressman" strive to produce a perfect job. Loafing on the job is prevented because the paper must come out on time—or the printing class will be overwhelmed with complaints and possibly ridicule.

The news-writing class in English often forms most of the staff of the school paper. In such instances a goodly portion of the class period is devoted to the actual work of writing and editing copy for the paper under the direction of the editor, with the aid and advice, when necessary, of the teacher.

The aim of these news-writing courses is not to turn out finished newspaper reporters and editors. Many of the students, after graduation, do make creditable showings as regular reporters, a result which indicates the practicability of their training, but the teachers recognize the need of their pupils for additional broad, college education before these boys and girls are ready to enter upon a professional career. The term "journalism" is not widely used in naming the high school courses, perhaps due to the suggestion some time ago by the American Association of Teachers of Journalism that secondary school courses be called "news-writing" or "journalistic writing," leaving the title "journalism" for the college courses.

This print shop at Manual Training High School, Kansas City, Missouri, where the ***Manualite*** is published by students, shows that school publications are printed by students under conditions identical with those existing in real print shops.

Interscholastic rivalry, which is largely responsible for the intense interests in athletics, has been introduced in the school publication field. Many colleges and universities, including the University of Kansas, Iowa State College, the University of Washington, Ohio State University, and Cornell University sponsor annual state contests between the school newspapers and magazines. The Central Interscholastic Press Association, backed by journalism students at the University of Wisconsin, promotes an annual all-American publications contest. This organization has more than 400 members in all parts of the country and endeavors to furnish advice, criticism, and information to its members by mail. As part of this work the association issues a monthly bulletin called the *Scholastic Editor,* devoted to the interests of school editors.

A correspondence course in elementary journalism will be offered the high school editors of Ohio by Ohio State University this coming year, university officials have announced. Enterprising newspapers in Cleveland and other parts of the country offer trophy cups for the best school papers in their territories.

Competition and interest in these contests is unusually keen, for the winning of a place means national or sectional recognition as well as local praise. Papers entered in these contests are generally subdivided into classes, according to the enrollment of the schools publishing them, so that all contestants will have equal opportunities.

The young editors take their work of school editors seriously and their professional spirit is marked. State organizations are common. Iowa, Minnesota, Kansas, Colorado, Oklahoma, Ohio, Illinois, Michigan, and other states have associations of high school editors. Their annual meetings are generally held at their state university where they discuss their common problems and interests, with university journalists and newspapermen to aid them in solving their difficulties. The Central Interscholastic Press Association holds an annual national conference. Nearly 300 editors from 17 states attended the last meeting of this organization. City and county editors' associations have been organized in several localities, such as Cook County (Chicago), Illinois. The advisers, by the way, attend the conventions and discuss their angle of the matter with one another.

The Western Wireless Press Association is an example of the high school editor's spirit. The *North Central News,* published by North Central High School, Spokane, Washington, promoted this organization, which has as its aim the exchange of school news by radio between the members of the Association. By means of school radio sets and student operators news is thus exchanged between publications almost 2,000 miles apart.

News and features which will interest his readers are just as vital to the aggressive school editor as they are to any editor. All the "stunts" and circulation building devices of the regular press are being adopted by the school editor. An information bureau, supplying true information, is a regular department of the *Weekly Scarab,* issued by East Technical High School, Cleveland. Prize essay and short story contests have been successfully conducted by several enterprising papers and magazines. A book review supplement consisting of four pages, regular newspaper size, is a feature of *The Southerner,* published by South High School, Minneapolis, Minnesota. Comic strips and even full pages of comic strips by student cartoonists have been used to interest student readers. The pink sheet extra, carrying the latest sporting news, is used by the *Senn News,* Senn High School, Chicago. A rotogravure section, which is thought to have been the first published by any school paper, was put out for the homecoming football game by *The Blackhawk,* Davenport, Iowa.

Teachers, under whose direction high school publications are edited, attend university summer sessions to take courses in journalism. The teaching of journalistic writing in high schools and the publishing of school papers is such a recent development that many of them had no opportunity to prepare themselves adequately for the work. Now special courses on the teaching of journalistic writing in high schools, with special reference to the publishing of papers and magazines, are given in many university summer sessions.

The enrollment of a high school is no criterion of its ability to publish a paper. *Le Sourire* is issued by a high school at Carson, North Dakota, in which only 39 pupils are enrolled. Perhaps a dozen other schools with enrollments under 100 publish papers. Weekly and biweekly papers in schools with enrollments of from 100 to 500 pupils are legion. Junior high schools have already commenced to enter the field and the number of publications issued by the junior schools is rapidly increasing.

Daily papers are now published by some of the larger schools. The *University High School Daily,* Chicago, and the *Shortridge Daily Echo,*

In oval—Mary Staples and Goodenow R. Winter, two editors of the *West High Weekly*, West High School, Minneapolis, a paper which has been awarded enough prizes to entitle it to be called America's best school paper.

Indianapolis, Indiana, are two instances where schools are publishing a paper every school day.

Both a monthly magazine and a weekly newspaper are frequently published by the same school, in some cases, where the enrollment is large. Magazines are not quite so popular as newspapers, but offer an excellent outlet for the school's art work, poetry, short stories, essays, and the like. Some of these magazines are excellent enough in their typography and art work to be worthy of a place alongside national periodicals. *The Forum*, a monthly magazine published by Senn High School, Chicago, is superior in many respects to the average college or university magazine. School magazines in many cases are printed in the school print shops.

But back of all these more or less apparent advantages of the school publication is a secondary, and perhaps even more vital service which they are rendering. This is the elementary journalistic training which they are affording a considerable number of high school pupils each year. In years to come the influence of this contact with journalism will, many believe, become apparent.

The present rise of school publications means that each year from 50,000 to 150,000 young men and women in our high schools are obtaining elementary training in journalism.

These students, after they go into the offices, factories, farms, and homes will be more intelligent readers of the newspapers than their parents. They will be one step nearer being the ideal reading public.

Mencken's Maryland!

By WILLIAM RUFUS SCOTT

MORE than two months spent in the home state of H. L. Mencken justifies the synonymous and possessive assertion—Mencken's Maryland. Before going to Maryland one has a definite impression of Mr. Mencken as the embodiment of a sneer and a snarl at what he sees as the idiotic, fanatical, hypocritical zeal of the American people for moral crusades; one cannot be in Maryland a bare 48 hours, particularly in Baltimore, without discerning that the state by a decisive majority has embraced his concept of the American people.

Maryland has been listening to Mr. Mencken's preachments against the idiotic, fanatical, hypocritical, emotional Americanism of moral crusades for many years. It may have been Billy Sundayism, it may have been prohibition, it may have been censorship of one kind and another, but in season and out Mr. Mencken has poured into the ear of Maryland, and into the national, and international ear, the suggestion that the one, the supreme demerit of Americanism is this penchant for moral crusades. Recently Mr. Mencken has gone to the Berliner *Tageblatt* to explain to the Germans this idiotic, fanatical, hypocritical proclivity of the Americans for uplift ideas.

Now Mr. Mencken is very much behind Mr. Creel's proposed Joint Committee for the Promotion and Protection of Art and Literature. He believes with Mr. Creel, as quoted in an interview, that censorship as such "no matter what its form or manifestation" must be abolished. Mr. Creel's statement that the proposal of a literary censorship "is admirably illustrative of the characteristic American passion for laws" is the gospel Mr. Mencken has been propagating.

The visitor in Maryland, however, whatever his views upon censorship, gains some impressions not flattering to Menckenism. Mr. Creel asserts what Mr. Mencken has been asserting for a long time that if "this spirit of beadle-ism (this idiotic, fanatical, hypocritical craze for moral crusades Mr. Mencken would put it) is allowed to continue without opposition it will in time crush everything in life that savors of truth and beauty." But Maryland is opposing this American spirit of beadle-ism and how much of truth and beauty is Maryland exemplifying? Are we to take Maryland as a sample of what America would be if, instead of Mencken's Maryland it becomes Mencken's America?

Under the philosophy of Menckenism the historic state of Maryland, the state with a brilliant past, is throwing its magnificent energies, focusing all its passionate desire—for what? For truth and beauty? No. For Light Wines and Beer! There is no other issue in Maryland. You are smashed in the face with it at every turn. Not so crushingly in the rural districts as in Baltimore, but since Baltimore is a large city in a small state, Baltimore is virtually Maryland. Mencken's Baltimore more decidedly than Mencken's Maryland, but both Mencken.

The visitor is oppressed with the immense obsession of the state over its alcoholic thirst. The tariff, the strikes, the nation's foreign policy, the bonus (except as it may through the lure of liquor taxation bring back intoxicants) are completely subordinated in Mencken's Maryland to Light Wines and Beer. "To recover man's God-given right to drink good alcoholic beverages," as an advertisement in the Baltimore papers recently stated, is the one, the predominant, the absorbing passion of Mencken's Maryland!

Presently the visitor would not be startled to hear the noble state song revised to the theme:

> Thy scorching thirst shall soon be quenched!
> Maryland, my Maryland!

Nor, in the light of Maryland's whole-hearted embracing of Menckenism is the visitor surprised at the official and private appraisal of Maryland as "the wettest state in the Union." It must be the crowning satisfaction of Mr. Mencken's literary career to have that characterization, because to Mr. Mencken it means the "sanest" state in the Union. But translated into literal English it means also "the most lawless state in the Union." The utopia of the bootlegger Maryland has become under the gospel of Menckenism which has dinned into Maryland's ears the idea that prohibition is just another of those idiotic, fanatical, hypocritical moral crusades of the American people. Defiance of the Constitution, of the enforcement codes, becomes the inevitable consequence if you are convinced that the amendment and the codes are the work of idiotic, fanatical, hypocritical zealots.

But if a passion for laws is a characteristic passion of the American people, as Mr. Creel asserts, and as the overwhelming ratification of the Prohibition Amendment proves, it is not something to sneer over and snarl about. It is something to examine soberly, for it is the genius of the American people. Mr. Mencken would eradicate this characteristic passion for idiotic, fanatical, hypocritical moral crusades and substitute for it what he advances as an unemotional, unrepressive policy. He would, in fact, engraft some European brand of nationalism upon America—any brand except the English brand!

Is it not significant, Messrs. Creel and Mencken, that so far from spending itself in the achievement of prohibition, the moral impulse of the American people is proceeding to a house-cleaning in baseball, motion pictures, the stage, and now the printed word? And so far as the characteristic passion for laws is concerned, it must be admitted that the American people did not legislate Messrs. Landis, Hays and Thomas into their positions as censors of baseball, motion pictures and the stage. The owners of baseball, motion pictures and the stage may have been endowed with extraordinary prescience, and voluntarily passed self-denying ordinances to head off a budding moral crusade of the idiotic, fanatical, hypocritical type. But then again they may have seen some basis for such a crusade. At any rate, there they stand, Landis, Hays and Thomas.

Mr. Creel is not promoting and protecting art and literature in defying this characteristic passion for moral crusades. He is getting art and literature in the way of a terrific legal jolt if art and literature do not take a hint from Landis, Hays and Thomas, and begin cleaning house. If there is anything being printed that outrages elemental decency Mr. Creel will be doing much more to promote and protect art and literature by striving to have that eliminated than by embracing Menckenism—the concept of the American people as idiotic, fanatical, hypocritical in their moral inclinations and ways of accomplishing their moral purposes.

For as surely as art and literature defiantly defend everything styling itself art and literature, the spirit of beadle-ism will not be stopped, nor the characteristic American passion for laws be thwarted; it will merely be made more certain that an aroused and perhaps angered public opinion will hit out hard, and in the hitting the good in art and literature will suffer along with the drastic pruning of the evil.

There is much more than guesswork to the estimate that in our 100,000,000 population the number for moral crusades is about 65,000,000 to about 35,000,000 who want the unrestricted state of things Mr. Mencken idealizes. Now 35,000,000 is a sizeable minority, but 65,000,000 is a conclusive majority as majorities go, in America. Hence, if art and literature become Menckenized and give the 65,000,000 the impression that art and literature are aligned with light wines and beer, the symbol of Menckenism, all of us who write (including a humble newspaper reporter like this writer) are in for some rough sledding.

The temper of the 65,000,000 is being hardened by things reported from Mencken's Maryland. Newspapers say that Baltimore policemen have stood idly by and allowed Federal prohibition agents to be roughly handled in the streets of Baltimore. That was the Constitution of the United States being roughly handled, Mr. Creel. That is ominous business, Mr. Creel. You are taking a grave risk in giving even the appearance of lining art and literature up with that, Mr. Creel. You think you are not lining art and literature up with that, Mr. Creel, but you are publicly scolding the American people for presuming to supervise art and literature, as they have presumed to supervise the alcoholic thirst, or baseball, motion pictures and the stage, and the 65,000,000 will not draw hair-line distinctions. They will classify your organization with the other organizations so vocal for license. You will be serving art and literature much more wisely if you re-name your organization the Joint Committee for the Expurgation of Vulgarity from Art and Literature.

Mencken's Maryland, "whose gospel is their maw!" But not for good. The now virtually inarticulate better side of Maryland will find a voice, and in time the state with the brilliant past will shake off its obsession, and whether wet or dry, will be so legally, and will seek its objectives by ways characteristically American—not Mencken!

What Would "Bob" Toombs Have to Say Now?

Quotations From the Record of the Ablest Man in Congress in the Fifties Would Sound Strange Today

By AARON HARDY ULM

> *"I have not been sent here to ask the public money for my constituents. For the eleven years I have been in the two Houses of Congress my constituents have never asked me to introduce one bill for their benefit, or the benefit of their pursuits, neither special nor general, and I have never introduced one."*

FICTION? No. Though the quotation sounds like one from a political novel of the Honorable Peter Sterling vintage, it comes authentically from the *Congressional Record,* or its predecessor.

And the following quotation is not from some history of the first Roman republic:

> *"If you are going to spend money wrongfully, if you are going to spend it profligately, I wish you to do it anywhere else but within the borders of my own state."*

Those words, like the ones in the first quotation, actually were uttered by a member of the United States Senate. The last were spoken in opposition to an appropriation for the continuance of a Federal Government activity in the Senator's state.

But neither group of words was spoken recently. They were uttered in the eighteen fifties by Robert Toombs, of Georgia, an outstanding national political figure of that time and regarded by many students as one of the four or five ablest public men of the period. Savoyard, the noted Washington correspondent, has written that in his opinion Toombs was the ablest man of that day.

Many changes have occurred since Toombs battled against wasteful spending and needless extension of governmental activity from Washington. Toombs, though a Congressional leader for nearly 20 years and the intimate friend of Daniel Webster, is now scarcely remembered as a statesman of national identity. Even when his career in Congress is recalled, his defense of Negro slavery is chiefly remembered. He resigned from the United States Senate when his state seceded in 1861 and the Confederacy was formed, and, unlike many other southern statesmen who survived the Civil War, he never made any effort to return to national public life. In fact, he became so embittered that he died without taking an oath of reallegiance to the Federal Government, though he lived for nearly 20 years after the Civil War ended and took active part in the politics of his state.

Thus his notable long fight against every Congressional move partaking of political "pork" has been obscured by the more striking features of his later life. And, instead of the scholarly statesman which on the whole he really was, he is remembered chiefly as a "fire-eating" Secessionist, which in reality he was not. He opposed secession until it was apparent that it could not be avoided, and while he was an intense proslavery-ite he admitted that there were many weaknesses in the South's "peculiar institution." Though he was given to the use of picturesque language, he never said that he expected to call the roll of his slaves at the foot of Bunker Hill.

But regardless of Toombs' identity with the defense of slavery and his ultimate leading part in the secession movement, it is interesting to revive some of his utterances and actions on national matters having naught to do with those two mighty questions of 75 years ago.

Toombs was among the last of American statesmen to contend that the "general welfare" clause of the Federal Constitution did not authorize Congress to raise for and spend money on anything it pleases.

"Rivers and harbors bills were abominations in Toombs' sight," says Ulrich B. Phillips, his most recent biographer, "because he considered them unconstitutional as well as corrupt. Again and again he resisted their enactment, now with fiery determination and now with unrestrained vehemence."

Discussing one in 1854, Toombs declared:

> *"The whole system is formulated on robbery, plunder and unequality and is supported for no other reason than because it is unjust. If the money which is appropriated to these improvements had to be paid out by each locality they would prefer a more convenient method of doing it; but it is because they expect to plunder other sections that they ask to pay themselves out of the common fund."*

On another occasion, discussing a proposal that the Federal Government spend large sums on Mississippi River improvements, Toombs said:

> *"Senators, is it just? I tell you as God lives it is not just, and you ought not to do it. There is manhood in the people of the Mississippi Valley. Let them levy duties for their own rivers and ports . . . . and charge the people who use them for the benefits conferred.*
>
> *"Let the honest farmer who makes his hay in Vermont, who gathers his cheese, who raises his meal, be not taxed to increase your magnificent improvements of nature and your already gigantic wealth. Senators, it is unjust."*

When confronted with logrolling methods of getting appropriations through Congress, Toombs said that the "letting of this sluice from the public treasury and letting it run at the will of the majority, I deem it so important that it may be worth an empire. We are called upon, on the idea of everybody helping everybody's bill, to vote for them all. There certainly can be no greater abandonment of public principle than this here presented."

How many members of Congress would dare repeat as their own the following words uttered by the famous southerner on the subject of legislative trading?

> *"If any man votes for one appropriation to get another, he votes corruptly and is unworthy of a seat on this floor. It is against the principles of legislation and against all principles of honor."*

What would Toombs who, when the cost of the Federal Government reached that sum, declared that $30,000,000 a year was "more than any government on earth is worth" say of the present cost which is 400 times that amount? Would he repeat, without qualification, the following charge?

> *"I do not believe today there is as corrupt government on earth as that of these United States. And most of this corruption is in the legislative department."*

But in view of the increasing number of appropriations made from the United States Treasury to the states on condition that they raise similar amounts and surrender certain prerogatives to the Federal Government, Toombs undoubtedly would reassert, with additional emphasis, the following statement:

> *"When the system shall have finally been established that the States are to enter into a miserable scramble for the most money for their local appropriations and that Senator is to be regarded the ablest representative of his state who can get for it the largest slice of the Treasury, from that day public honor and property are gone, and all the states are disgraced and degraded."*

The insidious danger in practices now probably insuperably imbedded in our governmental scheme is shown by the following eloquent passage in a speech delivered by the Georgian while still a member of the United States Congress:

> *"The Constitution is based on the idea that where the interests of particular localities are at stake, men are not to be trusted; majorities are not to be relied upon; they are unjust; they will take advantages; the whole history of human life is daubed and blackened by the injustice and wrong of power."*

Toombs' last public service was to frame the present constitution of the state of Georgia, which is notable for the checks it places on those in power with reference to the raising and spending of public funds. When he had finished the job, Toombs, drawing on his talent for epigram, declared: "I have locked the state treasury and thrown the key away."

"Every Day in Every Way I'm Getting Better"

Concluded from page 7

on to stand up. The patient reached for his stick, but Coué put it out of his reach and declared, "You know you can stand up if you will kindly favor me by just *thinking* you *can,* instead of you *can't.*"

Soon the man was on his feet and Coué taking him by the arm told him to honor him by taking a little walk around the room. At first slowly and a bit painfully, but soon with more assurance and ease, the man was walking. Then Coué withdrew his grasp from the man's arm and as he was about to seat himself said quietly and very gently, but firmly, "Now you see that you really have the use of your arms and legs. Don't be afraid to use them. Just to prove it to yourself and to me double up your right fist and hit me a good strong blow on the chest."

Joining in the general smile, the whilom paralytic raised his fist and struck out with such force that Coué would have been toppled over if he had not caught and braced himself. By this time, the whole room was laughing heartily and Coué seemed to enjoy the joke as much as anyone.

To a person who complained of fatigue, Coué said, "Well, I know what that is. There are days when it tires me to receive people, but I receive them all the same and all day long. Do not say you cannot help it. One can always overcome oneself. The *idea* of fatigue brings fatigue. But the idea that we have a duty to perform always gives us the strength for it."

To another he said, "The cause which prevents you from walking, whatever it is, is going to disappear little by little every day. You know the proverb: 'Heaven helps those who help themselves.' Well, stand up two or three times a day, supporting yourself on two persons, and say to yourself firmly: 'My kidneys are not so weak that I cannot stand; on the contrary, I can because I think I can.' All that we think becomes true for us. We must not allow ourselves to think wrongly."

To a patient suffering from diabetes, he said: "Continue to use therapeutic treatment. I cannot promise to cure you, but I can tell you how to cure yourself. All you have to do is to make your autosuggestions night and morning. Under this faithful use of autosuggestion, I have known diabetes to disappear completely."

"You, Monsieur, tell me that you are in pain; but I tell you that from today forward, the cause of this pain, whether it be called arthritis or anything else, is going to disappear with the help of your subconscious mind, and the cause having disappeared, the pain will gradually become less and less and in a short time it will be nothing but a memory."

I had an interesting talk with a famous Edinburgh preacher who had gone all to pieces with nervous prostration following severe war and after-war strain, so that he had been obliged to give up his work. He told me that he had suffered for many months from acute insomnia and restlessness. He suffered tortures and felt that he was on the brink of madness or suicide. One after the other, eminent physicians had proved incapable of helping him beyond giving temporary relief by the administration of anodynes. So he had journeyed from Scotland to see what Coué could do for him. He confessed to skepticism as to the new autosuggestion, but coming to the clinics day after day for two weeks, the apparent miracles that he witnessed in hundreds of cases had brought him to the realization of the power within himself to conquer his trouble and he was, in fact, tremendously encouraged and beginning to get a sure grasp on himself through the new hope kindled in his heart by witnessing these facts. He looked confidently forward to taking up his church work again with more energy and deeper understanding than ever.

In our chat after this afternoon clinic, M. Coué told me that he had treated more than 250 cases in the course of the day and that the day was an average one. He was not at all tired and declared he could go on until midnight if necessary. In fact, after an early and light dinner—he is practically a vegetarian and lives very simply, rising early in the morning to work several hours in his garden before his clinic begins—he disposes of a considerable correspondence answering personally 30 or 40 letters from patients and disciples. Many of the most remarkable cures effected through his method have been in the cases of persons living at a distance from Nancy and who had simply read and followed the directions printed on a leaflet for free distribution and which I have quoted above.

I have been under the impression that he was a professor in the University of Nancy and that he had, as a "psychologist of the chair," simply developed and carried into practical application the teachings of Liebault and Bérnheim, in which I had myself been much interested as long as 30 years ago. He surprised me by telling me that he had never been a professor or teacher; that while living at Troyes he had, during certain brief visits to Nancy, attended one or two of Bérnheim's famous free clinics, subsequently reading Bérnheim's book. But his own life-work had, for the most part, been in the field of industrial chemistry, in which field he had invented and put upon the market about 100 processes and preparations that are today widely used. Almost from the first, he had reached the conclusion in his own mind that not the hetero-suggestion of the hypnotists of the old Nancy school and of that eminent American practitioner, Professor John T. Quackenbos, formerly of Columbia University in New York, but *autosuggestion* was the real agent in the marvelous healing and correction of moral and mental defects and delinquencies credited broadly to "Hypnotism." This conclusion was strengthened by his reading of several American exponents of what has come to be known as the "New Thought" movement.

About 20 years ago, he retired from active business to devote his entire time and energies to "helping sick and suffering people to help themselves," as he put it. *He insists that he never healed anybody in his life,* that what he accomplishes is not due to any special gift in the way of personal magnetism, or unusual powers of any sort. Blessed with an excellent constitution, he has never had a serious illness. Asked if that meant he had not first tested his method on himself, he laughingly replied: "Oh, yes; for instance, one cold damp day last spring while I was bending over for a long time bottling wine in my cellar. I had what might be called a touch of lumbago. Interrupting my bottling for a few moments, I rubbed my painful back and said, as I instruct my disciples to say: 'It is going away, going away, going away,' (*se passe, se passe, se passe*). And it went away—and did not come back."

I mentioned several books about him and his method which are just now the talk of Paris and London. "I have not read them," he declared, "I am so busy with my work of showing people how to help themselves in what seems to me the simple, common sense, as well as certainly scientific way, that I have no time to read.

"I do not know anything about psychoanalysis, and I do know, as a result of practical work with thousands of sufferers from all parts of the world during the past 20 years, just what my own method is and what it will do. So, believing in the wise old saying, 'Cobbler, stick to thy last,' I am content—for the present at least—to hold fast to its divine simplicity."

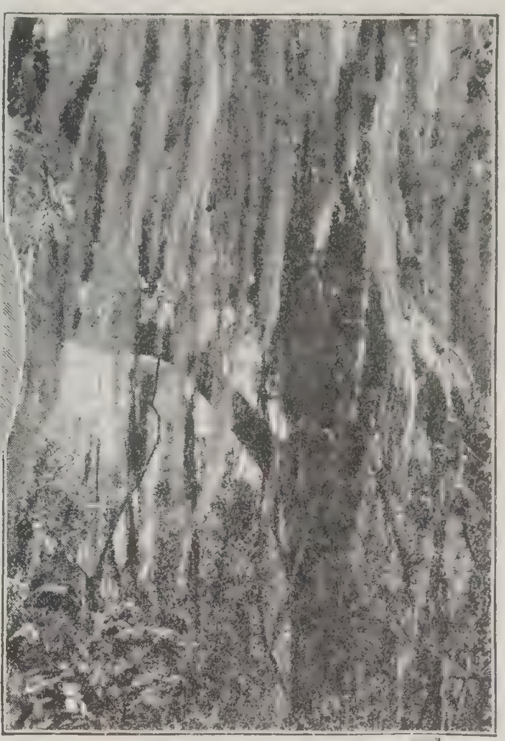
Call of Florida Coast Soon Will Lure Northerners

Beauty of the East Coast Near Miami Attracts Many in Winter

Palms sway languorously on the edge of the Atlantic surf.

Photos by Edw. E. Sheppard, Miami Beach, Fla.

Where northerners find a haven from the blasts of winter.



Spanish moss hanging from trees offers many a weird setting.

Some of our northern conservatories have specimens of the lovely palms that everywhere grace a Florida setting.

"Allah Achbar! Mohammed Resoul Allah!"

Concluded from page 2

Here are the words of the Prophet of God: "I, therefore, the last of the prophets, am sent with the sword! Let those who promulgate my faith enter into no argument nor discussion, but slay all who refuse obedience to the law. Whoever fights for the true faith, whether he fall or conquer, will assuredly receive a glorious reward. The sword is the key of heaven and hell; all who draw it in the cause of the faith will be rewarded with temporal advantages; every drop shed of their blood, every peril and hardship endured by them, will be registered on high as more meritorious than even fasting or praying. If they fall in battle their sins will at once be blotted out, and they will be transported to paradise, there to revel in eternal pleasures in the arms of black-eyed houris."

As if the foregoing were not enough of an incentive to make the Moslem terrible in battle, the Koran adds the Thar, or doctrine of Blood Revenge. "O true believers, the law of retaliation is ordained to you for the slain; the free shall die for the free." This is the command which gave rise to the terrible battle cry: "An eye for an eye; a tooth for a tooth!" These fighting attributes of the Moslem soldiers are what makes a "Holy War" so dreaded. Well-equipped and well-led, the Moslem fighter must be practically annihilated before he can be conquered—the experience of the British at Gallipoli and the Greeks before Smyrna bear witness to this truth; history abounds with proofs.

Speaking dispassionately, putting aside religious and racial considerations, and admitting the truth, it must be allowed that Kemal Pasha has the best of the argument with the Allies when he pleads in justification of a war to enforce the provisions of the "Nationalist Pact," for he can point to the fact that he is patriotically fighting for the preservation of his country, while the Allies can only claim, justly, a desire to maintain possession of stolen property, won by conquest or diplomatic chicanery. Mesopotamia, Syria, Arabia, Palestine, Egypt; none of these lands are an integral part of England, or France, or Italy; they are an integral part of the Ottoman Empire—thus thinks Kemal Pasha and thus think the millions upon millions of Moslems throughout the world. Islam enters the lists with this thought. "Thrice is he armed who hath his quarrel just!"

At this writing, Kemal is yielding nothing; the Allies are granting him Thrace to include Adrianople. He is restraining his troops, and right willingly, for he is reaping the fruits of recent victories and saving men and munitions for future use. The Allies will salvage the "open gate" through the Straits, the "Pact" grants them that much, otherwise they will meet the terms of the Nationalists. Will Kemal stop there? Will he be satisfied with Constantinople and Thrace? It is doubtful. Every inch he gains from the Allies makes him so much the stronger with the Faithful; every inch the Allies yield reduces their prestige with their Moslem subjects, and, by the same token, weakens their control of those subjects. Kemal will undoubtedly consolidate his present gains, and then cut off another section of the territory enumerated in Article One of the "Pact"; thus he will rebuild the Ottoman Empire section by section, and, when fully prepared, will launch his war for the complete fulfillment of the Nationalist program—the independence and freedom of the Ottoman Empire.

Such a war will involve all Europe and most, if not all, of Asia, together with Northern Africa and Egypt. The islands of the South Seas are too remote to be drawn in, but the same may not be true of America. The only hope of escaping a "Holy War" rests with the Allies; they must unite and present a solid front completely to head off Kemal Pasha, and that means giving up their selfish exploitation of the Near East.

Why the Canadians Enjoy Living in Canada

A Picture of the Winter Life of Quebec Reveals the Color and Beauty That Go to Make Up the Snow Sports of the French City

A parade of the snowshoe clubs up Dufferin Terrace.

By E. L. CHICANOT

THERE seems to exist a tacit agreement among Americans that it is distinctly bad form, and apt to endanger a straining of peaceful relations, to bring up the subject of the Canadian winter. One may discuss Canadian prohibition from any of the angles it permits of without any apparent danger of causing Canadians to rise up on their hind legs, but when an American meets a Canadian his painfully dexterous avoidance of the topic of winter is positively heart-rending to witness.

The American, in general, finds it difficult to understand how a people he regards as otherwise normal, and possessing the average degree of sanity to be encountered on the continent, can passively remain in their country throughout the winter months without doing something drastic to alter climatic conditions, like bringing the Gulf Stream up the St. Lawrence. They find it impossible to comprehend why individuals who have the money and leisure to get out and go to Florida or the Bermudas don't do so. American tourists flood Canada throughout the summer months, for reasons best known to themselves, but at the first suggestion of frost, indeed, before the first leaf has turned color, they scurry back to their steam-heated apartments as at the approach of some deadly scourge whose breath is mortal. They have, in fact, been fed on too regular a pabulum, by the press, of lost balloonists, mounted police-Eskimo stories, dog derbys, and fur-trade history, until their perspective is many degrees out of line and their mental pictures a fantasy of exaggerations.

Canadians, taken as a body, cannot be convinced that there is anything seriously wrong with their climate. They do, however, appreciate the difficulty of popularizing their winter, for authors and scenario writers have done their work only too well. These calumnies used to enrage Canadians until they came to realize the inevitableness of it all. Now they merely sigh, as in bright *capuchons* and sweaters and gaudy *ceinture fléché,* moccasin-clad, gayly disporting themselves on skis and snowshoes, with Switzerland and Norway at their very doors, they fervently wish they could drag up across the border half of the American populace, and send them back to educate the other half to Canada's winter joys.

When they run across a particularly harrowing story in the press, purporting to portray the frightful rigors of the Canadian winter, and in imagination see thousands of credulous readers hunching their shoulders in a shiver, the many who know it must think of Quebec when winter has resumed the throne there. Quebec and winter seem indissolubly associated so that the one suggests the other, like ham and eggs. Visualizing the quaint old French city, with its narrow streets deep under snow, its cathedrals and churches in all manner of unexpected places, its Old-World atmosphere and Continental leisure, one wonders what the fate of that historic old spot would have been were Canada's climate other than what it is.

Quebec is beautiful in summer, when hosts of tourists flock there to gaze down the Heights of Abraham, where Wolfe fell, to the mighty St. Lawrence below, and, indeed, its medieval charm and historic interest will attract and enrapture at all seasons, but in winter it is a different city. Wrapped in its snowy garments, each spire and minaret snow-tipped, flashing with a thousand lights and colors, it seems to contain the concentrated essence of winter joy. The visitor gets the impression of its having been created solely as a locale for winter sports, with a setting for hibernal gayety which leaves not a thing to be desired. Winter and Quebec! They cannot be separated.

Life is casual in Quebec. The inhabitants move in a casual manner as if life were quite a pleasant affair, to be enjoyed calmly and not rushed through. The street cars even have a casual manner, though their sudden appearance round the corners of the narrow, crooked streets is at times extremely disconcerting and has developed a new winter sport peculiar to the locality. The taxicab is an anachronism, being several periods of history ahead of its time. The tardier sleighs fit more harmoniously into the picture, and they are to be seen everywhere, the air resounding with the joyous tinkle of their bells, the sound of which carries for miles.

It is peculiar of Quebec that the entire population enters unanimously and whole-heartedly into the revels of winter, as if it existed on earth for nothing else. Nothing else seems to matter very much. Everyone seems to be above the necessity of toiling for a living, or at least can make this subservient to the real reason of living in winter. Other Canadian cities have their winter sports but they are merely incidental to the main purpose of extracting a livelihood. In Quebec one thinks, moves, and lives in terms of winter enjoyment and such things as serious purposes in life are rendered purely secondary considerations.

Quebec is a small city, concentrated on a series of hills, the eminences, depressions, and sides of which are equally intensively utilized. The area of its winter gayety is much smaller. The unique feature of the city's winter revelry is, in fact, its compressed, centralized form. Herein lies possibly the greatest attraction of this quaint little spot to the visitor from the outside world curious to see how Canadians disport themselves and, in true tourist fashion, anxious to observe or participate in as great a variety of these winter frolics in as short time as possible. Granted the disposition, the physique, and the stamina, one may here turn from one sport to another in ceaseless action and run the entire gamut of Canadian winter revelry, and never depart from the solid comforts of an ultra-civilization. A week-end is sufficiently prolific in incident and crowded with event to furnish after-dinner conversation of a mild order for at least a year.

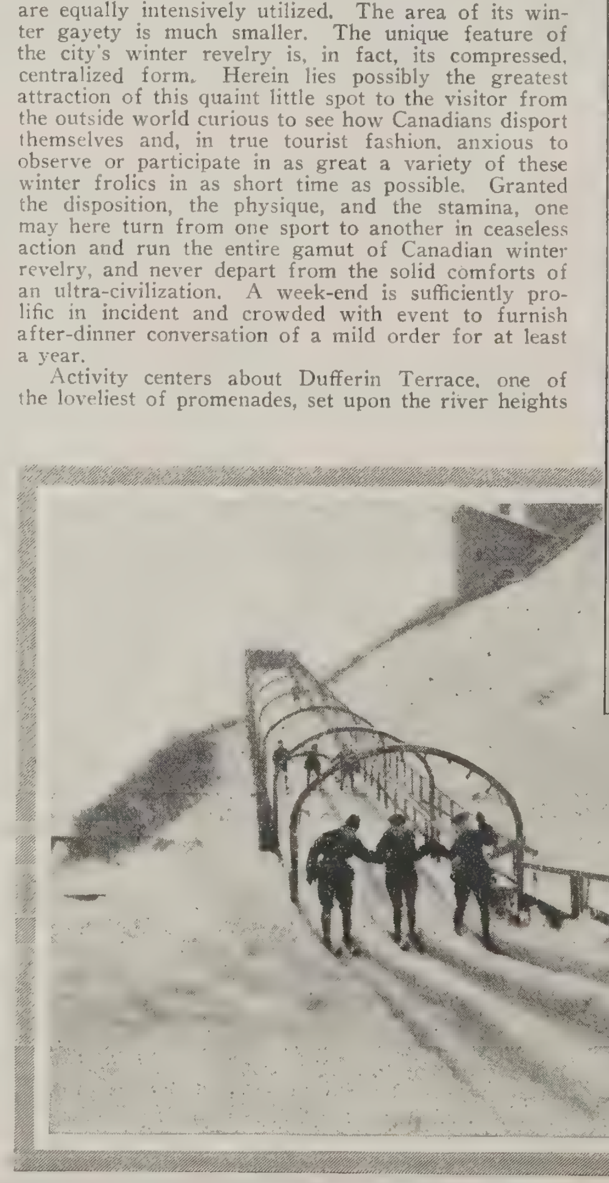
Activity centers about Dufferin Terrace, one of the loveliest of promenades, set upon the river heights overlooking the St. Lawrence far below and the town of Levis on the other side. During the winter months this is the pivot of a restless energy, thronged with people of all ages and conditions who have at one time or another become imbued with the conviction that the Canadian winter climate was intended for other purposes than to produce rich furs and the summer's ice. The locality is a riot of color as it is a prime object of indulgence in winter sports to present as flaming and conspicuous a picture as possible for the frame of white snow. Each snowshoe club has its distinctively colored *capuchons* and combinations of colors in its *ceinture fléché.* Sweaters and scarfs appear which would cause a riot at any other time of year. There is no hard convention in the matter of what is proper in winter sports' attire and the result is a pleasing variety of costume.

The atmosphere of gayety and spontaneous joy existing where a large proportion of the crowd is French-Canadian is quite indescribable. For buoyancy, light-heartedness and irresponsibility it can only be likened to a carnival of Old France. The sun shines down upon sparkling snow while the sports' area becomes an almost solid mass of humanity burdened with the various implements of pleasure. For about it is a regular chain, each link of which is a different sport interlocking into one gigantic winter revel.

The open-air skating rink is hidden behind walls of snow and it is only when that peculiar sound of skates cutting ice falls upon the ears of the passer-by that his attention is attracted to heads appearing above the bulwarks apparently floating in thin air but in reality attached to the bodies of skaters below. His attention to these is apt to be abruptly and startlingly diverted by a skier careering down the hill sacred to the sport and missing him by one of those miracles common to sport. Over the brow of the same hill snowshoers may appear at any minute, returning from a hike or race.

Down the side of the hill and along Dufferin Terrace is a toboggan slide which once traversed is a lifelong memory. The three runs are molded in solid ice and there is no synonym for their quality of slipperyness. One starts, and it is all over, though looking back it seems impossible that such a variety of emotions could have been crowded in what is no space of time at all. Three toboggans are released together and throughout the

Cercle Frontenac Snowshoe Club initiates a new member.



Thrilling and exhilarating.

A rally of snowshoers from all parts of Quebec province.

entire day series of trios, on toboggans of various sizes and capacities are shooting down the terrace in less time than it takes to tell about it.

Skijoring has become very popular at Quebec and the narrow, crooked streets, with the confined space for navigation, add considerably to the thrills of the sport, for there is bound to be a certain amount of excitement when the horse disappears suddenly round a corner and the skis evince not the slightest inclination to follow. It is not an unusual thing to find a skijorer in the heart of the city contesting the right of way with a tramcar, or propeller and propelled parting company to avoid taking part of the traffic away with them.

Gliding effortlessly along the same streets a less active visitor may be seen borne along in a trapper's sleigh by husky dogs, with Indian driver urging them on in that curious mixture of French and Cree which has come to be the vernacular of the northern trails. It is a perhaps not inappropriate manner in which to visit the old ramparts or travel to the Plains of Abraham or up Citadel Hill.

At night the terrace is illumined by a thousand colored electric lamps, the varied tints of which the snow reflects back. Circles of light inclose the toboggan slide which, with its icy troughs gleaming in the glare, seems more alluring than ever. A dull volume of light falls upon the river and stray fragments of floating ice throw back some chance gleam. Young and old are disporting themselves in one way or another, enjoying the Canadian winter as it was meant to be enjoyed.

More can happen in a Quebec week-end in the way of event than the average law-abiding citizen finds in a hard-earned annual holiday. Quebec believes in doing a good thing thoroughly. Excitement never wanes until the last hours of Sunday night, for Quebeckers have their own conception of the reason for the creation of the Sabbath. All the time skating rink, ski-jump and toboggan slide are crowded with devotees to a positively perilous extent and the very air is so intoxicating that the most misanthropical finds it difficult to maintain a grouch.

The city and countryside have their several ski and snowshoe clubs, and a deadly rivalry, of the boisterous, vociferous kind that is typically French-Canadian, exists between them, finding its expression in the contests and competitions at the week-ends. Some really excellent ski-jumping is to be seen and the complications of the plain snowshoe mush constitute an art. French-Canadians cling tenaciously to the old sport of snowshoeing which, has elsewhere lost popularity as its place was usurped by skiing. Snowshoe meets in Quebec are elaborate affairs, comprising races of all descriptions, marathons, and hurdle contests, the participants' costumes bringing together a collection of colors that make a rainbow look a dull affair. Such meets inevitably end in a certain amount of horse play, forming human pyramids, tossing the blanket, the while the quaint old folk songs of old French Canada follow one another in rapid succession.

The impression may perhaps be created that all this winter dissipation is staged for the benefit of tourists and other visitors. Nothing is further from the truth. The average French Canadian doesn't care one snowflake whether other people come up to dissipate in his country, and the people of Quebec City are really slow in taking advantage of what is undoubtedly an asset of inestimable worth. Their first idea is to enjoy themselves. If visitors come they are glad to have them join in, but they don't go out of their way to tell them about it.

There is nothing forced about the excitement of winter sports in Quebec, nothing to suggest a straining after effect, to show other people what a fine time it is possible to have. The spirit of winter enjoyment is inherent and dominant and those who do not care to indulge in the more strenuous and youthful sports at least do not shun the open but become imbued with the same carnival spirit and help create the same atmosphere of fun and good fellowship.

For the visitor to Canada who wishes to see for himself as much as possible of Canadian winter sports and pastimes, and absorb the utmost of winter enjoyment, in a limited space of time, Quebec is an ideal city. Stepping from a modern train he is transported instantly into surroundings redolent of most romantic Europe and from thence to the microcosm of Canadian winter gayety. A week-end there is crowded with incident and event from arrival to departure, and the visitor may come to appreciate to some small extent what can be made of the Canadian winter, and why Canadians continue living without protest in their country.

The Money's Worthless But It Buys a Lot

German Mark at Store Purchases More Than American Dollar Does

By WALTER M. WOLFF

THE individual who, as far back as 1915, began to invest his savings in German marks, has dropped his good American dollars through a hole in the floor. He will never see them again; they're gone. He has but one last chance in the world to catch "value received" by the tail, but he must hurry. The German mark is headed downward and no one can today sound the pit into which it is falling. If a man waits too long, and continues to hold on to his German marks, the day is about to break when he will be unable to buy the matches to burn them up. Such is the situation for countless thousands of misguided investors who sought to outdo "G-R-Q" Wallingford by buying and holding German paper marks.

But what is the actual condition of affairs in Germany today? Has money there any value left at all? The answer is: Yes and No. It is a little-known fact that the valuta situation of foreign countries today has produced a big assortment of freaks. A most illusory one is the fact that the face value of German paper marks cannot be figured in dollars and cents any longer—unless one takes only the largest denominations. *In* **purchasing power,** *however, the German mark has from* **two** *to* **50** *times its intrinsic value.*

And herein lies the secret of the "value" of the German paper mark, as well as the "freakiness" in it. At the present writing the dollar has become worth more than 3,000 marks, or, vice versa for the German, the mark has dropped to 3,000 to the dollar. Let us stop a minute to realize just what this means. Our smallest coin (with which the familiar postage stamp, box of matches, or stick of chewing gum is purchased) is the copper penny. In school we learned that 10 mills equal 1 cent; 10 cents equal 1 dime; 10 dimes equal 1 dollar or 100 cents. But we seldom speak of "mills" in our daily business life. It is very seldom, comparatively speaking, that financial experts make much use of them. But in Germany today ONE MILL IS WORTH THREE MARKS!! In other words, *one mark* has a value of but one-third mill (and even less)!! Is it any wonder a German hesitates to emigrate to the United States; that he cannot now buy American food, American clothing, American raw materials, and so on? It simply cannot be done, and German-American commercial activities are destined very soon to fall into a grave state of lethargy.

The German mark today worth less than ONE-THIRD OF A MILL! Why, a newsboy would have to take THIRTY MARKS before he could give back to a German ONE CENT in fair *exchange*. And if that same newsboy were in Germany the next minute, he would have stories to tell that would make his pals' eyes pop out with astonishment five minutes later. And why? Because for 30 marks he could have purchased two good cigars, or a bar of chocolate, or a pair of leather shoe strings, or a big toy, or, or—well, *lots of things that ONE CENT wouldn't begin to touch in U. S. A.*

But to come back to the MARK. With its intrinsic value of less than one-third mill on the world market, it still has the *purchasing power* of from ONE-HALF TO THREE CENTS (on the average) in Germany. The pretty 50-mark note would bring but one and two-thirds cents *on the bourse*, but one can still buy a railroad ticket, a big loaf of bread, a fine glass of beer or wine, *two* tickets to the best movies in town, or a big bouquet of flowers with it—IN GERMANY. Take the larger denominations—the 1,000-mark note. It has an actual value *in exchange* of about *thirty cents*. Thirty cents will buy a good laugh in the States; but 1,000 marks in Germany will feed a tubercular child for TWO WEEKS and milk now costs 60 marks a liter. ONE THOUSAND MARKS will give you a five-hour ride on the fastest train; it will buy you five good square meals (but you must do without champagne). One thousand marks will also enable you to rent a fairly good furnished room in any German city for ONE MONTH! Think of it!!

The largest denomination Germany has today is the TEN THOUSAND MARK certificate. If the mark falls still further, Germany will soon need ONE HUNDRED THOUSAND MARK notes, but let this be as it may. It is enough for us to know that 10,000 marks are worth but a little more than three of our dollars. On account of the shortage of currency of large denominations, it is very hard to get a 10,000-mark note changed in Germany even at the large banks. Imagine a man in New York or Chicago running all over the city trying to get change for *three dollars!* And three dollars just *begin* to represent some value to us. Some of us have to work a whole DAY to earn this amount. Others spend it in one evening for an opera ticket, or for taxi fare.

But in Germany—AND ONLY IN GERMANY—the equivalent 10,000 marks will *buy* all sorts of things, from a diamond ring to a couple of choice shares in any good German industrial concern. It will also enable a small *German* family to live *tolerably* well (with strict economy) for ONE MONTH! An American family has more or less of a hard time living on $3 a day!

Everything is far cheaper in Germany today than it ever was before, NOT EXCLUDING the peaceful days prior to 1914. *BUT* the German receives so little wages today, compared to the cost of commodities that to him everything is exorbitantly out of reach. And it does not take a prodigy to know that an average wage of FIFTEEN OR TWENTY thousand marks *a month* is nothing when shoes cost *five*, suits *twenty*, and overcoats *thirty* thousand marks.

Right now every German is worshiping the Almighty Dollar. He has already begun to take *only dollars* in payment for his wares or services in many instances. If the government did not prohibit the buying of and speculating in dollars, every German would immediately dump his paper marks on the exchange market for what they would bring IN DOLLARS. It is one salvation for Germany that speculation in this respect is somewhat curbed.

It is also true that many profit and grow fat at the expense of their fellow men. Large industrial enterprises in Germany are declaring enormous dividends, and many a director or stockholder is a paper milliardaire. But, as is always the case, the unbearable burdens of debt fall not upon him who has the money with which to pay, but upon him who has it *not*. And the big, underpaid, overworked majority has it *not*.

As for the American coming over with the hope of reaping gain from the buying power still left to the mark (which the German *should* but *does not* get), my candid advice to him is *stay at home;* he isn't likely to be welcome under the present circumstances. And if he has by chance still a batch of paper marks which he considers a part of his assets, let him dispose of them. I know a man who bought *ten thousand dollars'* worth of marks about four years ago. He paid SIX CENTS for every mark, and for his money secured a little more than 160,000 marks, which was still quite a bit of money in those days. His investment, however, cost him $9,950, for today his paper is worth scarcely FIFTY DOLLARS! Almost unbelievable, isn't it? Nevertheless, it is APPALLINGLY TRUE!

There never was a bigger soap bubble than the German-mark investment scheme into which thousands of Americans fell and fell deep. Only the lucky tourist who passed through Germany or sojourned there last summer succeeded in benefiting somewhat from the valuta. (Don't aggravate him by asking him what his hotel bills were, or what he had to pay for a stop-over in Bavaria, or what the customs authorities did to him)—but some things were give-away cheap, anyhow.

BRIEFLY TOLD

Next to the main entrance of the Doorn city hall, there is a small space on the wall, covered with glass, in which, according to the prescripts of the Dutch law, are published the names of each couple intending to be married within two weeks. In this little square there was pasted, recently, the marriage announcement of the ex-kaiser and Princess Hermine of Reuss, both "without occupation." The groom's title and domicile are given as "Emperor and King Wilhelm II, age 63 years, living in Doorn."

The Canadian government is considering plans for the electrification of the Temiskaming and Northern Ontario Railway. The water power in the North, much of which is undeveloped, would, if developed, effect a considerable saving.

Prohibition department chemists at Washington have developed a process making impossible the redistilling of wood alcohol and denatured alcohol into alcohol for beverage purposes.

St. Anne de Beaupré basilica will be reconstructed next summer, it was learned from the Redemptorist fathers. The new church should be completed by the spring of 1924. The old church ruins have now been removed.

Rye is to be the medium of exchange in the German free state of Oldenberg. "Rye notes" will be issued based on rye value and will be worth a certain amount of rye. The holder of the notes, after four years, will receive the gold value then prevailing for the amount of rye indicated on the notes.

To prevent destructive activities on Hallowe'en night by youngsters, Independence, Kansas, gives a big party for the children, the agreement being that they shall run the town to their hearts' content on that day. A big bonfire ends the day's play and the children go home and stay there They have parades, and school is dismissed early in the afternoon so all can participate. Merchants and business men foot the bill.

A new fruit called peachmond, combining the luscious qualities of the peach with that of the edible kernel of the almond, has been perfected by the Mexican federal agricultural department. Freestone peach cions were grafted with the papershell almond common to California to produce the new fruit.

George Bernard Shaw is a vegetarian.

The author of "Black Beauty," a Quaker girl, wrote the story on her sick bed and sold it for $100. More than 3,000,000 copies have been sold in America alone The writer died one year after the book was published.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

China consumes the entire herring catch of the British Columbia coast, which averages about 40,000 tons annually. The fishing season is now in progress.

There is an ancient British-built railway in Sinaloa, Mexico, which has ties of ebony. The Southern Pacific's tie contract for its Mexican branch calls for mahogany among other kinds of wood.

Senator W. H. Felton, of Georgia, the first woman named to the United States Senate, speaking in defense of Abraham Lincoln, said: "I'm as much a Daughter of the Confederacy as any woman in the South, but it is ridiculous to charge that Abraham Lincoln fomented the war between the states. With all deference to southern historians, the charge that Mr. Lincoln caused the Civil War is not sustained by the facts of history recorded more than 50 years ago. I cannot remain silent when the truths of history go to prove that Mr. Lincoln did not inaugurate the Civil War."

Waterproofing cloth by means of applying the fresh sap of the rubber tree direct to the cloth with a brush, as a coating, is a success. The sap must be less than 24 hours old and after being applied to the cloth it is passed over the smoke of an ordinary wood fire. The product gives satisfactory service.

The Iceland poppies at Banff and Lake Louise, Canada, blossom continuously from early in May until October. They were first planted by Princess Louise at Lake Louise about 10 years ago and now cover acres there. They are the first green things to show above the soil.

A two-seater land-type flying machine landed on the deck of the man-o'-war, United States Steamship *Langley*, off the Virginia Capes recently, while the vessel was going at six knots. A 30-mile wind was blowing and the plane, landing at a velocity of 45 knots, was stopped by the arresting gear within 25 feet.

The University of Michigan is classed by Professor Albert Bushnell Hart, in the *Harvard Alumni Bulletin*, as one of the six "national" universities of the country, the other five being Yale, Harvard, Cornell, Columbia and Chicago. In Professor Hart's own words, "They come nearest to being national academic melting pots, and so help to make the world acquainted."

Duty on distilled spirits in the United States during the past year amounted to $50,000,000.

A woman in Montreal, more than 100 years old, has outlived all the beneficiaries in her will, her husband and her two children, as well as the executors of the will and the notary public who drew up the document.

Sunken ships are now being raised by means of compressed air.

Edmonton, Alberta, owns its utilities and a paving plant. It is now planning to obtain leases of tar sands deposits at McMurray and prepare its own road materials.

Switzerland plans to electrify all its railroads within 30 years.

In spite of excessive floods in the northern part of the Changsha district of China, excellent harvests are now being brought in. Severe famine conditions existed for over a year throughout this district but a short time ago.

Dates are being produced in commercial quantities in California.

The people of Rhodesia, Africa, have decided to maintain their present status and not incorporate in the South Africa Union.

The former Kaiser William's memoirs, handsomely bound in cloth are selling for seven cents a copy in Berlin. The books are a good quality of linen paper with substantial covers.

Benito Mussolini, Italy's new premier and head of the Fascisti, says: "We intend to follow a policy of national dignity in our relations with foreign countries, not a policy of adventure, but one of friendship to those nations displaying friendship for us. Please emphasize that we are not anti-proletariat."

CHRONICLER OF THE NEGLECTED TRUTH

Farmers of Kansas Are Happy, "Chunk's" Going to Topeka

Mr. Davis and his party mule.

This Cincinnatus Was Husking Good Kansas Corn When Word Came That a Republican State Had Chosen Him to Go to Capitol

DAVIS' ELECTION CALLED NEW LEASE

THE Kansas farmer, who for three years has been fighting hard to keep his nose off the grindstone of financial difficulties, today is sitting alongside his fireplace, puffing long green in huge clouds of tobacco smoke, and smiling to himself. That self-satisfied look is typical on the face of virtually every farmer in the state. For every farmer has felt the depressing times of the three years about as hard, if not harder, than the average business man.

But out in Kansas the farmer today feels as though he has been given a new lease of life. "Why?" you might ask.

"Jonathan McMillan Davis is gonna run things down at Topeky the next two years, starting January first," will be the farmer's reply. And then he'll smile some more.

TWO men sat in the "front room" of a typical farm home in Bourbon County, Kansas. There was a fireplace in which a big log burned, an old-fashioned "secretary" on which lay a well-thumbed "Life of Theodore Roosevelt," a sewing machine and some comfortable rocking chairs. An old-fashioned rag carpet was on the floor.

Outside almost a flock of buildings and pens stretched away. In front of the two-story house, painted white, was a road. None too good, it led to Bronson, a railroad station a few miles away. Beyond the roads were barns and pens. There were hogs, cattle and farm implements. It was as typical a farm scene as may be found in the Middle West.

As the men talked a woman entered and left the room repeatedly, carrying away newspapers, clippings, letters and circulars. Occasionally she would ask one of the men if he desired certain papers kept. She was just such a motherly woman as may be found on many farms. But it was plain she was more proud of her husband than the average farm wife. And she called him "Chunk" while he retaliated with "Molly."

And well she might be proud. Only a few days before, her husband had been called from the field like a modern Cincinnatus and informed he had been elected governor of Kansas. Cincinnatus, however, was plowing when the news was brought to him. The governor-elect had been husking corn. He had stayed in the field, he said, because he desired to have the farm work completed as early as possible so he would be ready to move to Topeka, the capital, with less confusion.

The new governor-elect, Jonathan McMillan Davis, will be the third Democratic governor Kansas has had since she found her way "to the stars through difficulties," as the state motto proclaims. It seemed to Kansans almost unbelievable, a few days after the election, that he had been elected. There had been nothing to indicate it was a Democratic year in Kansas. It was not. Every other candidate on the Republican state ticket had been elected. The Republicans controlled both houses of the legislature at the same election which made Jonathan Davis governor instead of a man on the majority ticket, much more widely known and personally popular.

In 1882 Glick had been elected as Kansas' first Democratic governor. He defeated St. John, a candidate for the third term in a race in which Prohibition was the issue. Hodges was elected in 1912 when the Bull Moose movement divided Kansas Republicans and Wilson carried the state. But Davis had no such upheaval to help him through. He says he won because he was a farmer and other farmers trusted him for that reason. Certainly they voted for him.

In his campaign Davis visited the farmers. He made few speeches. He pledged himself as against the industrial court, an experiment Kansas has been making in adjudicating labor troubles by forbidding strikes and providing a court wherein labor or employers might take complaints for adjustment; for reduced taxes, in favor of abolishing the Kansas state utilities commission, the state's rate-making body, against tax-exempted bonds, excessive appropriations for any purpose, for the enforcement of the laws against tax-dodging and for "the repeal of all obnoxious laws."

"If my opponent is elected," he told his campaign crowds, "and his wife goes to Kansas City she will step into a taxicab and direct the driver to take her to the——————(the finest hotel in town). If I am elected and my wife visits Kansas City she will go to the——————(a fourth-rate hotel). When she arrives she will look around and say, 'Isn't this grand?'"

And so Davis made his campaign. Every other week he tried to get home, if only a few days, to "make a hand" in the field. For he really is, as he claimed to be, "a dirt farmer." It was crop-growing time and help was expensive. The deflation that hit other farmers in 1920 didn't overlook Davis.

He spent virtually no money in the campaign except his traveling expenses. He had little organization. The so-called party leaders didn't help him to the point where they could be accused of tearing their shirts for him. They didn't expect him to win. A more polished candidate had made the race for the Democratic nomination on a platform calling for a Federal price guaranty on everything the farmer produced that would insure a profit. He had been beaten by Davis. But the other candidate had been more of a politician. He had held lucrative Federal appointments. And farmers just turned to one of their own kind.

The Davis family is an old one, as families go in Kansas. The governor-elect possesses one attribute not now essential but a requirement a few years ago. He was born in a log house. It stood on what now is a part of the Davis farm, just across the road from the present Davis home. His grandfather was a shoemaker, coming to Kansas from Illinois after leaving Pennsylvania. The governor-elect says of him that he had "lots of children and lots of dogs." The grandsire settled on a quarter section on which the log house already had been built, making the move in 1866. Welsh, Scotch, Pennsylvania and Holland Dutch make up the stock back of the governor, who was born in 1871.

Governor Davis attended the University of Kansas three years. He planned to get his degree from the University of Nebraska and began his fourth school year there but the death of his father, in an accident in 1893, called him home. Since then the governor-elect has been in charge of the farm.

What is known in Kansas as "the Buckfoot incident" reveals the strength of character of this owner of 1,700 acres of Kansas land. Members of the Republican legislature, already boasting they will "make a monkey of Davis," might do well to consider it.

In 1901, still young, he became interested in a young man working as a farm hand in the neighborhood. There was to be a foot race at Webb City, Missouri, a few miles distant. Davis and others went. It was said Davis bet on the race. He stoutly declares he did not. But he did lend $5,000 to some new acquaintances, he says, on the word of a Webb City banker who said "it was all right." The cornfield foot racer lost. The friends said Davis had bet and refused to repay the loan.

Davis investigated. He studied the thing. He knew legal efforts to recover the money meant scorn, ridicule and possibly danger from members of the gang which, he had learned, had swindled persons in many places on similar schemes. Three years after the incident he filed his suit. The case was bitterly contested. Davis was maligned, persecuted, threatened with death, but he kept up the fight. One of the leaders of the gang, reputed a "killer," made an appointment with Davis to meet him in a back room of an obscure St. Louis hotel. Friends warned Davis not to go. But he kept the appointment, was cursed, threatened, and finally offered a cash settlement. He wanted vindication in the courts, however. And he won the case. Through his encouragement, example and help, other victims of the gang recovered more than $100,000 of which they had been swindled. The case

The Davis farm home.

resulted in Davis long being known as "Buckfoot." The nickname was applied in derision. Sometimes it still is used. But, he pointed out, Missouri has a law requiring suits for gambling debts to be filed within 90 days. Davis filed his suit after three years. And he won it.

Politics is not entirely a new game to the governor-elect. His first political job came from a Republican President, he proudly recalls. In earlier days a post office known as Eve was maintained at the Davis home. The mother of the governor-elect was postmistress. Young Jonathan was commissioned her assistant by President McKinley.

He resigned his first political job, under a Republican President, to run for the legislature on the Democratic ticket. He was elected to the lower house in 1901. Later he was returned to the legislative session in 1907. He was re-elected in 1909 and 1911. Following those terms he served in the upper house until 1920. Two years ago he was a candidate for governor and was beaten by 100,000 votes. That will indicate the turnover in the Kansas vote on governor this year.

"But I knew it was coming," he said. "I felt this was the year. You see, I talked to farmers and they told me how they would vote. The Republicans didn't know."

Mr. Davis married Mary Purdon in 1894. They have three children. Russell Gordon Davis, 26 years old, is the apple of his father's eye. Russell will run the farm while his father is running the state. A fall in a gymnasium several years ago resulted in the younger Davis suffering what commonly is known as a broken neck. He was in a hospital 18 months, but he recovered. He served in the aviation corps in the war.

Mary Frances, now Mrs. Dewey McCormick, whose husband is a farmer living near Ford, Kansas, was the second child. Lola Nelle, the youngest, is teaching her first school in Linn County, near home. All went to school in the same district in which their father received his elementary education, known as the Davis school, and all were born on the same farm on which their father was born.

The Davis farm is operated along modern lines. There are hogs and cattle as well as fields of wheat and corn. And there are many acres in grass. There is a modern accounting system and the bulletins from agricultural colleges and farm magazines are studied.

Mrs. Davis could not, by any stretch of imagination, be called a society woman. At the time of the visit she was ridding her home of the accumulation of campaign litter preparatory to moving to the governor's mansion in Topeka in time for Mr. Davis' inauguration, January 14. One of her worries was about her home-canned fruit. She put up 400 quarts of it this summer. It was a good fruit year in Kansas where fruit is an uncertain crop and Mrs. Davis said one wasn't just canning fruit for another year. It was to be canned to last until another fruit crop. Would that fruit keep in the cellars of the executive mansion? That interested her greatly. She didn't care anything about the pattern of the wall decorations. She was proud of her husband, happy in his success, but visibly relieved because the campaign was over and she could clear away the litter from the front room.

"My chief concern is for the farmers," Governor-elect Davis said in discussing what was to be his policy while governor. "They have been hard hit. I know their condition. I pledged them I would reduce taxes. I'm going to make every effort to carry out that pledge.

"Taxes are too high. Government has been costing too much. The farmer, in Kansas, carries the main burden. The Kansas farmers are hit hard. They can't afford to pay high taxes."

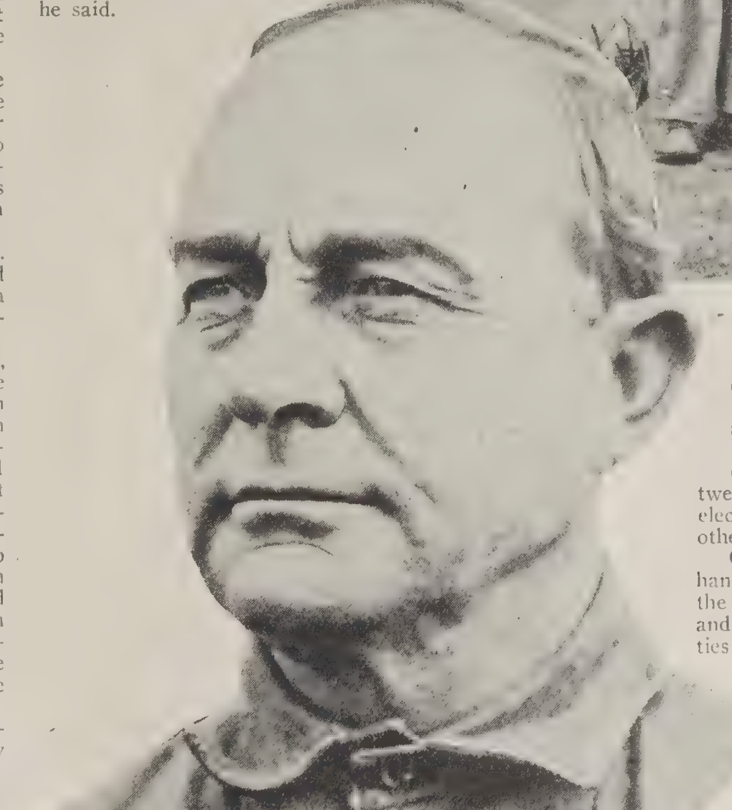
He said it in a way that made the listener understand better why farmers believed the campaign pledges were made in sincerity. It helped one understand why this man had carried rock-ribbed Republican strongholds, his opponent's home county and every county joining it.

"This is one election where the politician cut mighty little figure," he said. "Neither the Republican nor the Democratic leaders control me."

There was something in the way the jaws of the governor-elect closed that suggested the snapping of a steel trap.

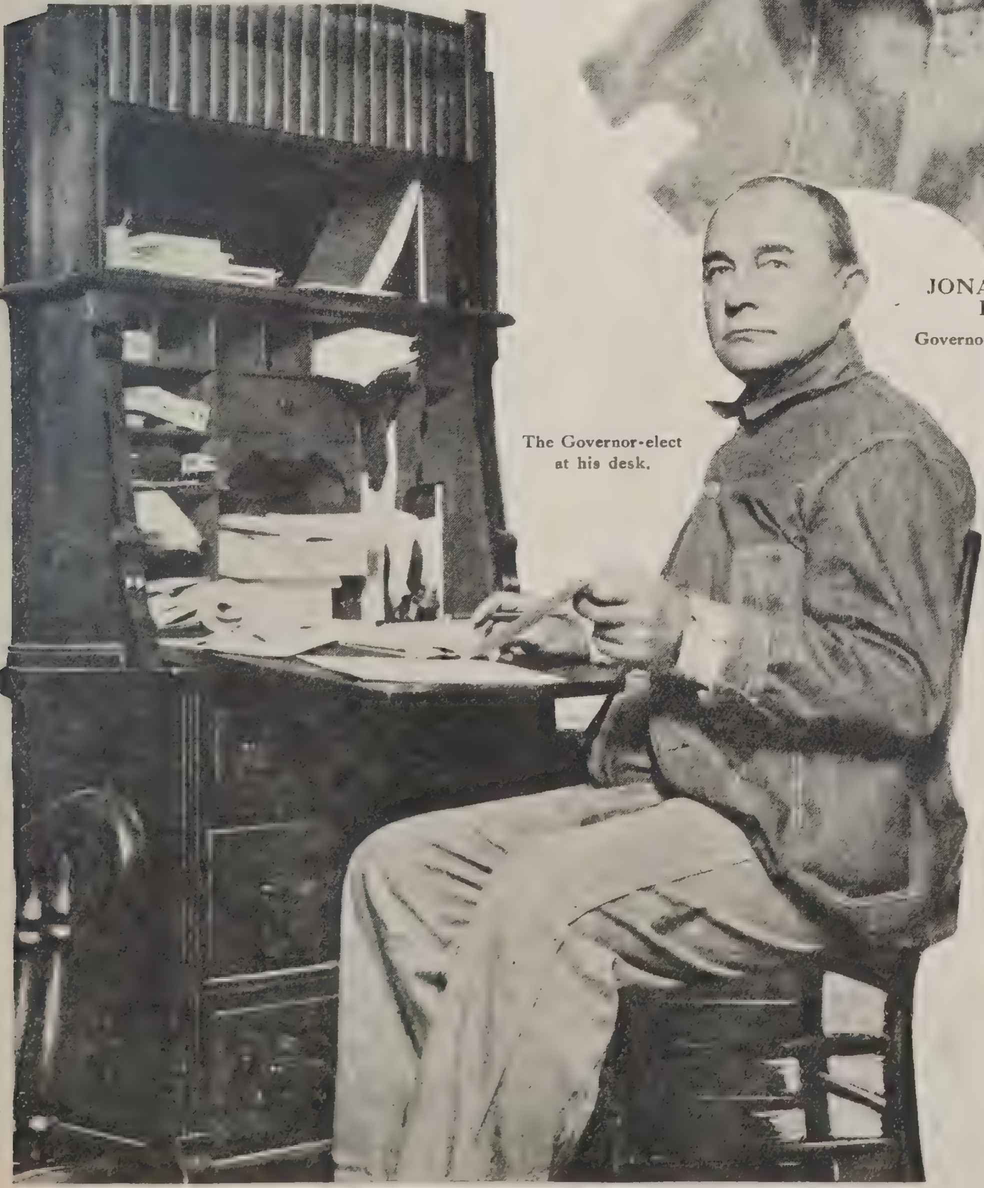
"I am not obligated to any politician or set of politicians," he said.

Chunk and Molly.



JONATHAN M. DAVIS,

Governor-elect of Kansas.



The Governor-elect at his desk.

What would he do about the industrial court? Labor centers, as well as agricultural communities, had given him a big vote because of the opposition to the court in the Democratic platform.

"I would like to work out a plan whereby a court of district judges could sit as a commission in labor cases," he said. "I would not take away entirely the right to strike but I would make it impossible except as a last resort. I favor allowing labor to quit work when it desires. But the matter of taking a club and driving the other fellow away, when he desires to work, is different.

"The public utilities commission should consist of one man, standing as a buffer between the railroads and the public," the governor-elect continued. "I would turn the control of other utilities back to the cities, where it belongs."

Governor Davis is expected to have his hands full getting some of his proposals through the legislature. Both the house of representatives and the senate have sufficient Republican majorities to override any executive veto. However, should the legislature desire to fight the new governor, it might be to his advantage, as the two main problems deal with taxation and labor questions, both vital to the common folk of Kansas.

However, should the legislature override the new governor's proposal to abolish the industrial court, Mr. Davis will have the power to appoint men of his own choice, and in this case, should he please, he could pick $1 a year men to serve in that capacity, and it is not altogether improbable that this is what he will do.

The governor-elect is opposed to "style." Pressed pants and stiff collars mean nothing to him. A few days after his election he attended the Kansas-Nebraska football game. There he passed unnoticed by the thousands of football enthusiasts. His soft collar was unbottoned, his pants bagged at the knees, his coat was wrinkled and his hat looked as though it had seen its best days.

"But that's when I feel the best," is the way the new executive puts it, "and that's the way I am going to feel as long as I live. Comfort in what one wears is about the easiest thing one has to get out of this life, anyway."

Down in Bourbon County the farmers are rejoicing. They're happy because they believe they were instrumental in "putting Jon'than over," as they say it.

In the Davis home there are both happiness and sorrow.

All the Davises are "glad that daddy won, but just think, we'll have to give up the farm and get into the whirl at Topeka," said Mrs. Davis.

"Who'll attend to my chickens?" she asked. "I guess we'll have to get some help, or maybe I can stay here while Jonathan goes to Topeka and works as governor."

"Oh, we'll attend to that, Molly," broke in Jonathan affectionately.

Then Mrs. Davis began making excuses for the appearance of her home.

"You'll just have to excuse us," she said, "but you know Jonathan never picks up a thing. He gets a letter and then he reads it and then he lays it down. He never puts anything in place."

Then she turned to the governor:

"Jonathan, what do you want me to do with this stack of literature?" she asked as she pointed to a bundle of political propaganda.

The Davis home has also been the home of some orphan boy or homeless old person the last 25 years Six boys have been reared or partly reared by Governor and Mrs. Davis—one just can't help wanting to say "Pa and Ma Davis." Felix Kelly, an old man, stayed at the Davis home 15 years, until he died.

It is hardly believable that a man, almost unheard-of out of his home state, could have the following at home that Jonathan M. Davis really has.

Time to Resist

WHATEVER the fate of the Shipping Subsidy bill may be, its endorsement by President Harding and its furtherance by every device at the command of the "crowd" is significant of the complete demoralization that has overtaken the advisors of the Government. The same persons whose consciences would not permit them to grant a bonus to the soldiers are eager to grant endless subsidies to the marine speculators. The peripatetic and highly diverting Lasker, most lavish of all Washington's post-Volstead entertainers, must be allowed to make his contribution to the present Administration's record of statesmanship. The Administration must be equipped with a strong stomach, to judge by what it has swallowed without gagging. The veto of the soldiers' bonus; the high tariff; Lasker's high ship subsidy—the latter two being sheer legalized robberies of the daily income of the plain people. These are the three high peaks. One can understand that Mr. Harding may have done the first from a sense of duty; one can understand that party dominated the second; but in the name of Country AND Party what accounts for the third?

It is very bad policy for the Administration to use this special session in an "After me the deluge" spirit. Mr. Harding ought to understand that what the next Congress will not do, the country does not want done. Mr. Harding ought to understand that if this special session does what the next Congress would not do, there may come such a series of undoings as will banish the Republican party for a decade. It almost seems that the President doesn't care; he sometimes appears like a man who has already thrown up the sponge. And constantly the situation is changing. A few months ago the President would have found it necessary to initiate and carry through some policy to regain strength with the people. But that time is past. The only path open to the President now is the Path of Resistance. He can still deserve well of his countrymen if he will steadfastly resist the pressure being brought to bear on him now. Certain self-seekers, who call themselves friends of the President, think that they foresee defeat in 1924. Therefore they are pressing the President with all their force to get certain questionable things done before that time. They fear the deluge. If the President rises like a rock and blocks the rush of wrong policies—if he refuses his favor and *fights against the wrong* as in the last two years he should have fought for the right, 1924 may yet be kind to him—but whether or not, he will in the meantime win a public respect and affection which have not yet been evoked.

Why Not Elsewhere Too?

PACIFISTS may be right in their teachings, yet not in their motives. That is, they may preach unpreparedness (which is regarded as a synonym for pacifism) merely for the purpose of leaving one nation unarmed against the attack of another. That kind of pacifist does exist, that kind of pacifist work has been carried on, although it is by no means true that all pacifists are of that kind.

Again, pacifists may be right, but in the wrong place. There is no doubt whatever that if an international ballot were taken in America and Europe, on the two questions, Do You Want More War? and, Do You Vote for Wars to Cease?—the overwhelming vote on the first would be No, and on the second, Yes. There is no question about that. The Christian world at least needs no persuasion as to the greater desirability of peace. So far as any one can see, none of them is looking for war. But in the event of that statement being questioned, it may be confined to the only two nations that matter now in questions of world peace and war, Great Britain and the United States—there is no question that neither of these nations is seeking war.

So, the thought sometimes comes unbidden whether the pacifist works had not better be moved out of the peace-loving, peace-seeking nations, into the midst of the nations that still glorify war. Why collect large funds and endow numerous secretaryships and support hosts of lecturers and writers to urge upon us the desirability of that which we already desire? Why permit this pacifist mission to degenerate into professionalism? There is Turkey, for example, where a peace propaganda is seriously needed. There is also Russia with its exceedingly large and cruel army, its schedule of future wars and future victims all made up. There is—but why recite the whole list? The profitableness of peace, the beauty of peace, the possibility of peace, the general desirability of peace—these are all true doctrines; probably even a German professor would accept them now; but why act as if the United States and Great Britain were the only countries specially in need of this teaching?

Could not pacifist propaganda be spread abroad into Asia and the islands of the sea, whence the next war seems to be surely rising?

A California Farmer Tells It

"To The Editor:

"A general belief among a large number of us farmers of California is that the automobile had more to do with California going dry than any other one thing.

"So many people have been killed by drunken drivers that the old cry of 'personal liberty' has been changed to one of PERSONAL SAFETY at least among us moderate drinkers. Gas and booze won't mix and there are too many machines now to take any chances on drunken drivers. And so long as they can get booze—either bootleg or good corn liquor—we will have drunken drivers. So for our own personal safety we simply can't let them have it, and that is why we moderate drinking farmers put California dry."

Money Rentals Higher

THERE is much complaint in commercial and industrial circles that interest rates are again rising, and that money is growing more difficult to find. The difficulty is easily located. The power to issue currency lies in the hands of interests to which tight money means increased profits. Government, unable to pay such of its obligations as mature this year, has been in the market for the sale of new bond issues at an attractive figure. Oversubscription was hailed as a sign that the country was flooded with money seeking investment, a belief not exactly warranted. The desire to secure as large a block as possible of government bond offerings leads to subscriptions exceeding the amount a syndicate expects will be apportioned, with the idea that such apportionment may be increased to an amount more in accord with the available funds it has to invest. This is safe, since any excess can easily be absorbed by others not so fortunate as to secure enough.

The embarrassment to commerce and industry is in being obliged to compete with government in the securities market, a competition which stiffens the interest rate. Outstanding securities also suffer, the holders finding lower quotations in case they desire to realize. Thus the Liberty issues, other than those now maturing, suffered a decline.

This situation presents another argument for the abandonment of the interest system so far as public securities are concerned, a way to which has already been pointed out in these columns. With every government bond carrying the circulation privilege, and every incorporated bank permitted to use it in that manner, the United States could be relieved of its interest burden as rapidly as outstanding securities mature, and in 30 years, the life of this year's issue, or sooner, if there is an option of earlier redemption, government could be freed from *its interest burden, now about a billion a year,* while interest rates to commerce and industry would find a lower level.

Do We Own Or Do We Owe?

IT IS not often that this paper calls its readers' attention to articles appearing in its pages. The articles we print have merit enough to make their own way to the readers' attention. But occasionally, because of a familiarity with titles, a reader may overlook an article in the belief that he has explored the subject before, in which case it becomes a service to direct his attention.

This week The Dearborn Independent prints an article which should be read and pondered by all serious people. It is, in its way, a most daring article, without having any of the atmosphere of sensationalism about it. It goes clean contrary to one of the most exploited statements of recent financial propaganda, namely, that the United States is *the* creditor nation of the world because it has all the gold in the world. W. H. Allen, the author, challenges the statement, shows the figures, and withal does a piece of work that deserves the consideration of every business man and every thinking citizen. Is the propaganda true? If not, why is it put forth? Mr. Allen is the as yet unchallenged contender for a point of view which seems to be in entire accord with the facts. After reading what he has to say this week, the reader may have appetite for more, in which case he may turn to The Dearborn Independent of November 4, page 12, and November 18, page 10.

The Money Question as handled in this paper goes to the root of the thing. We have no new theory to exploit. We have no cut-and-dried system to spring upon the people. We are not enthusiasts for any of the hundreds of "solutions" which have been invented. Our great desire is to induce the people to turn their eyes on our Money System and see what it is—that is all. We want the common sense of America, and the sense of justice of America, to examine the Money System. We want the plain man and woman to get the bottom facts, the indisputable A B C of the matter. Here is a place and a good time to begin. We are being told that we own the world, that all the world owes us, that the gold of the nations has all flowed into our coffers, that *we are THE creditor nation.* Well, are we?

In the Investors' Supplement of *The New Witness,* published in London, the able editor discusses the financial situation and records hopefully that the British have at least one thing to be thankful for, namely, that they have ceased borrowing money. He says:

> "We have, at any rate, ceased borrowing money, but *we are the only country in the world that has,* **for even the United States continues to borrow."**

The emphasis of type is ours. "The United States *continues to borrow.*" That is a story entirely different from the one we have been told for years since the Armistice.

Now, let us have the truth. Are we a Creditor nation? or are we a Debtor nation? It matters greatly to you, whether what you earn is being absorbed outside the country, or whether it is increasing the prosperity and stability of your own country. It means a great deal to you whether there is a powerful group engaged in telling you one thing over and over, to prevent your suspecting the truth.

It would not be a bad idea for you to get out all your copies of The Dearborn Independent for months back, and read all the articles on this important question.

'Dry' Enforcement Begins at Home

PRESIDENT HARDING and his Cabinet are reported to have been in serious conference regarding ways and means of enforcing the "dry" laws. Will the gentlemen permit a suggestion? Why not begin at Washington? Why not begin in official circles? Why not begin in those sumptuous homes which entertain the very highest personages in our government?

This is not a taunt, it is a serious and respectful suggestion. Everyone knows what has transpired at Washington since Prohibition arrived. Only the loyalty of certain men to the sentiment of respect for the personages of the government has prevented a crashing scandal at times. To these men whose forbearance has been intensely patriotic it has come with hopefulness that the Cabinet meeting may result in Obedience to Law in the City of Washington.

Let the word go forth that members of the Executive and Administrative branches of the government have set themselves a rigid standard of obedience to the letter and the spirit of the law—and see what a difference it will make in Washington.

Mr. Ford's Page

A BOY'S magazine is urging, with commendable foresight, that the boys of the present generation "make politics their job." That is the slogan, "Make Politics Your Job." It is stimulating to think of the results to the country if the growing generation should really go in for an intelligent interest in public affairs. But it must be plain to everyone that this counsel should be amplified.

There was a time when this advice was not needed by young men. They were all informed, all interested, all active in the public affairs of the country. Politics was a citizens' affair. It was as much a part of common life as was daily work; no one thought of politics as a separate profession. People did not "play politics," to use a modern expression; they thought politics and acted politics and were sincere about politics.

What changed all this? It was the coming of the thing that we today know as "politics" which drove the people out of Politics, and gave the very word an ill odor. Politics is the business of living together as a nation, in prosperity, peace and security. Just how that business can be counted vile or unimportant, no one can understand. It must be that the thing which has come to be known as "politics" is not really Politics at all.

This is a matter to be clearly understood when we advise boys to study politics. Leaving the name aside, what is it that we wish them to study? Everybody has a feeling that the advice is right in part, but there is a hitch in it. If it means that boys should study the methods of the local precinct boss, or the inside philosophy of the county committee, or the mechanism of deals between candidates and "interests"; if it means that boys should understand the gentle art of getting the men without a conscience to do what men with consciences will not do, though the men with the consciences are the beneficiaries; if it means that boys should study the whole system of the scramble for paltry public clerkships which are supposed to carry a little "political power" with them—then it would be just as well to oppose that advice. But, of course, that is not what is meant. Yet this is what comprises a large part of practical politics as they exist today. The whole machinery of selecting officials has fallen into the control of the least desirable class, the most cunning class. Oh, yes, the ballot is free enough and clean enough, but the ballot is only the last touch; all the real work has been done before the ballot is used. That is one point that has so greatly exasperated the people. It is a very bad situation when the people see that the ballot's power is limited, that it can occasionally stop something the people do not want, while it can hardly ever give them what they do want, the simple reason being that issues and elections and candidates are not arranged with a view to giving the people what they want.

> *SHOULD a young man study Politics? Yes, if he will make up his mind what Politics are to be twenty years hence. To study today's so-called politics would be waste of time—they are obsolete. Politics, in the true sense, have to do with the prosperity, peace and security of the people. What has the county or state committee to do with these things? How much has the prosperity of the country been advanced where Government has touched the things pertaining to it? The Politics of tomorrow will deal directly with these things. Politics will become an administration of the people's affairs in the people's interest. If a young man wants to fit himself for the Politics of tomorrow, let him fit himself into essential industry for the purpose of learning how best to conduct it for the whole public good.*

Now, it is a pretty good rule, when dealing with young people, to fix it strongly in their minds that what exists now, what is popular now, what is in the ascendant now, is not a pattern to follow. Tell them to look ahead 20 years to what shall be. It would be a sheer waste of time for anyone to make himself proficient in politics as they are now played—because they are not going to be "played" that way much longer. We do not realize the immense damage we do by taking young men and making them believe that if they would be successful they must begin to do as we are doing. If there is any hope of progress at all it is in their *not* doing what we are doing. Let them construct their own country, let them try out their own vision—for they have one.

Before speaking of their vision, however, let us mention one or two things we ourselves can see. We can see a rising Politics that will have no place for the "politicians" of today—literally no place for them. Presumably there has been a place for them heretofore, else they would not have been here. But when you consider that Government itself is going to change, that it is going to cease to be a mere taxation system for the purpose of keeping in session more or less irrelevant bodies and for the supply of hosts of jobs—when you consider that Government is going to change amazingly in the direction of serving the prosperity and peace and security of the people, that politics are going to become as non-political as farming or manufacturing, then you get a glimpse of the new sort of man whom we shall find in politics.

Just take an example: Government ownership of railroads is bound to come. The railroads of the country must be placed in one system, operated as a whole for the benefit of every corner of the land. The branches that pay must support the branches that do not pay. It must be a vast union of service. That is coming. But it is recognized that if Government remains as it is, it would be infinitely better if Government ownership never came. The time is past when people believe that there is any magic in Government to make things go. Government, as an entity, resolves itself into a few men, and Government is wise or foolish, able or weak, as those few men are wise or foolish, able or weak. If the Government is ever to take over public business successfully, its personnel must be changed to include men who can manage that business. Lawyers and spellbinders and successful county politicians cannot qualify to manage public utilities whose management makes or breaks the people's prosperity. Look at railroad management: it has absolutely dictated the lives and misfortunes of tens of thousands of farmers.

Young men can get ready for the new Politics by learning to do something on a wide scale, by learning the secret of management for the public benefit. The Government of 20 years from now will be made up of men who really know how to do things. Railroad men, miners, water-power engineers, farmers—men from every great national line of endeavor will make up the Government. What possible room can there be for the county politician under such a system?

Young men ought to be asked to visualize the kind of world they would want to see, the kind of country they would want to see. You can trust the disinterested, unspoiled vision of the young. Let them set up an ideal country, and then teach them to fit themselves for the duties they would like to perform in that ideal country. Certainly, "politics" as we know it will be no part of the ideal. Nothing is more destructive of young men than to be initiated into the schemes which older men tolerate in politics; it is the ruin of many young men who get the idea that crookedness is an essential element in success.

What kind of a money system would young men say was the most just and serviceable money system? Young men ought to be encouraged to study the money system at first hand—not out of books. At the best, the books try to explain a system which is so imperfect that it cannot be explained; and at the worst, the books try to defend the system. Young men ought to take up the question at first hand, making original research, settling first the question whether the present system is just and equitable, and, second, what improvements are needed to make it so.

Every kind of question affecting the public life and prosperity—transportation, monetary efficiency, fuel, marketing—these constitute the future Politics. These are the things which future Statesmen are to direct. The present time will be looked back upon as a period of struggling stupidity. Observers of the progress of the nation will mark the time when the "work" idea got into Government, pushed there by the necessities of national life, as the time when the old "politics" disappeared and the new Politics came in. National life must be organized—not regimented, but organized for efficient service—and then general prosperity will come, and with it the disappearance of our most vexed economic problems.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Checkers More Than "Your Move," Says Champion

Newell Williams Banks Tells of Intricacies That Confront One in a Scientific Contest

By H. G. SALSINGER

NEWELL WILLIAMS BANKS

For twelve years Newell Williams Banks has held the title of American match champion at checkers. During that time he has never been challenged for the title. He began playing checkers at six and when seven he gave exhibitions of playing simultaneous matches while blindfolded. He has been playing 26 years.

NEWELL WILLIAMS BANKS says that a child can learn to play checkers in 10 seconds but will be unable to master the game in a lifetime.

Mr. Banks learned to play checkers at the age of six. When seven years of age he played so well that he gave exhibitions, playing blindfolded, simultaneously against a number of opponents. He was 21 years of age when he became America's match champion. He is 33 years old and he still holds the title. As a matter of fact he has never been challenged for it.

He has never mastered checkers. No man ever mastered the game before him and he is certain that no man will ever master it in the future.

Checkers, according to Mr. Banks, was played 2,000 years before Christ. It has passed down through the ages, not always the same game but never with any drastic variations.

One time a noted scientist tried to figure out how many moves were possible in checkers. After spending a long time in study and research he said that more than 170,000,000,000,000,000 moves were possible.

Asked the same question one day a master of checkers told his questioner to get a grain of wheat. The next day he was to add a grain and each day he was to double the number of grains he had. At the end of one year he would have gained a fair idea of how many moves were possible in checkers.

Checkers, according to Mr. Banks, is the most remarkable method in the world for developing certain mental faculties. Among these are visualization, imagination, caution, memory, control of temper, concentration.

Take visualization in his own case: He plays blindfolded against 20 opponents. Each opponent is seated before a checkerboard that he cannot see. He has to develop a mental vision of each of the 20 boards. He plays the first board and then completely removes the mental picture of the first board and visualizes the second board and continues until he has played the 20 boards. Then he begins the round again. He has to depend upon visualization plus memory from now on. He has to recall the picture of the first board after the opening moves and make his next move. Then he must recall the second board while dropping the first from the mind. He concentrates on the second board, plays that and then on to the next. So he continues until every game has been won, lost or drawn.

The average number of moves in a checker game is 40. Since every move means a different picture the mind must, in playing against 20 opponents, present during the three or four hours required to play the matches, 800 pictures. Eight hundred moves are made but these moves all have variations and it is therefore necessary not alone to have in mind the moves that are made but the possible variations and during the progress of these matches some 6,000 possible moves will also enter the mind.

This requires imagination as well as concentration.

Checkers teaches caution. Many big checker matches have been lost when they were apparently won. With a few moves left, the apparent winner, due to the effect of his success, became careless and made a hasty move that wrecked an otherwise finely played game. A quick move, without the usual deliberation and consideration for possibilities and consequences, paid the price of over-confidence in defeat.

Great checker players were always men that perfectly controlled their tempers. Many checker players lose matches because when making a bad move they lose their tempers and a mental hazard is created which brings on other bad moves and defeat. No player ever became great at the game before he fully controlled temper.

Checkers teaches one to be careful. The man who learns the possibilities of checkers learns the value of thinking well before reaching a decision. He concentrates and visualizes consequences and possibilities.

Most of the leading professional men in America play checkers more or less. The game stimulates the mind as well as develops it. Checkers does for the mind what the "Daily Dozen" does for the body.

The vast majority of us have played checkers and nearly all of the vast majority have failed to realize its possibilities.

Before a man can become a good checker player he must know the 300 fundamental end games of checkers. All the openings and mid-game formations are developed to terminate in one of 300 formations at the finish of the game. Among these 300 final formations are an even dozen positions which are generally arrived at. These 12 positions are known as the 12 great masterpieces and they have been developed by the foremost players of the last 200 years.

In playing checkers 12 pieces are used on a side. There are 64 squares on a checkerboard but only 32 are used in playing. On a regulation board the squares are one and seven-eighths inches each way and the checker pieces are one and one-quarter inches in diameter. This makes them symmetrical and suitable to the eye. Playing checkers over a prolonged period is a hard strain on the sight.

The depth of the game will appeal to the imagination when one considers that no one, even when spending a lifetime, can count the number of moves possible over the aforementioned 32 squares and although the possible number is beyond human count, from 45,000 to 50,000 different moves are generally used to arrive at the 300 possible end formations.

Chess is generally regarded as a much more difficult game to learn than checkers. Nearly everybody has or does play checkers but only a few people play chess. According to Mr. Banks, who is proficient at chess as well as being a champion at checkers, the latter game is by far the more difficult.

"In chess there are more than one hundred times as many possible moves as in checkers but you work for something tangible," he explains. "It is much easier to learn checkers than to learn chess. It takes but 10 seconds to learn checkers; it takes more than two weeks to learn the first step in chess but, at the end of six months' time, the man who is learning chess will be a far better player at his game than the man who is learning checkers, provided each man is of equal mental ability and each devoting the same amount of time to practice.

"Checkers is more of a test of memory. It is necessary to memorize 10 times as much in checkers as in chess. You can generalize in chess but you must be specific in checkers. In checkers there are fundamentals just as sound as any in arithmetic. There are certain moves that can have but one result, nothing more and nothing less. You do not find this condition to the same degree in chess. You use intuition to a great extent on certain positions in chess. In checkers knowledge must be absolute.

"Comparatively few people play chess and still there are a great many more masters of chess than there are of checkers.

"To illustrate what knowledge must be had at the beginning of a checker game: Under the modern two-move restriction style of play there are seven distinct replies to seven opening moves. In some tournaments there are six openings barred, in others four of these are permitted. Besides this you have two opening moves that are never played because a piece is sacrificed. Being absolute losses these two moves are discarded, so where no opening moves are barred there are 47 possible openings. Since each opening move has 10 plausible variations that may be played you can readily see how many moves you have to be groomed on. There are hundreds of possible moves, any one of which may be made at the immediate start.

"In checkers you never hear of young prodigies like the latest sensation, Samuel Rzeschewski, a marvelous chess player who came out of Russia to this country at the age of eight and played the best amateurs in America. Rzeschewski began playing chess at the age of five and two years later he had obtained a fair mastery over the game. We have several young chess marvels in this country, one a girl of eight, but you never hear of child wonders at checkers.

"Among the chess fundamentals the king, knight and bishop checkmating your opponent's lone king is the most difficult ending where in checkers what is known as the third position and in which two kings and a single piece win against two kings is at least two times as difficult as the position I have described in chess. It takes 10 times as long to master the third position in checkers as the most difficult position in chess and any amateur player may try it to prove my assertion. Or let those that have mastered one position try to master the other and you will discover that those who have mastered the play in checkers will learn the play in chess in one-tenth the time that those who have mastered the position in chess learn that in checkers."

Checkers, widely known, is still but faintly understood and its infinite possibilities have escaped millions that have moved pieces over a checkerboard. The game is probably the oldest played in America and we are just beginning to realize what it offers.

The game has developed in the last few years inasmuch as more good checker players are developing than at any previous time. Checkers has taken hold and the result is apparent at the many tournaments.

It has always been the impression that Europe supplied the great chess and checker masters. There are, in Europe, among the leading professional men some noted masters of both games. Every continental country furnishes several. A large number are found in England and Scotland. Some of these chess and checker masters are famous in medicine, arts and science. The predominating number of the masters are followers of chess, few play checkers.

Mr. Banks won the American match championship from Hugh Henderson in 1910. Mr. Henderson was a Scotchman. He was a master of checkers in his own country and when he came to America he continued the game with great success.

The greatest chess master the world has seen was Paul Morphy, of New Orleans. He won the world's championship when he was 21 years old.

Chess is being played more now than in previous years. Checkers is being played better. If the mental caliber of a nation is to be judged by the success of its chess and checker players, and that seems to be the basis for judgment in a number of quarters, the United States should continue to hold her own among the intellectuals.

CHECKERS HAS WORDS CREATED FOR ITS USE

Checkers carries its own vocabulary. Among the more common terms and their meaning:

SACRIFICE—Where you give a piece for positional advantage, to win a game or to draw it. The word has a parallel meaning in baseball.

COUNTER-ATTACK— Starting an attack on your opponent's double corner when he starts one on yours.

WAITING-MOVE — Making a move to draw your opponent from a weak position. Inducing him to remove the possible protection of the position before you attack it. This play has its fellow in the delayed steal in baseball or the delayed pass in football.

FLUKE—An error or a blunder. Carrying the same meaning that the word fluke carries in other sports.

STROKE—A jump that captures two or more pieces.

COOK — The development of hitherto unknown play. Once played, the Cook becomes a part of published Checkers history and is added as a recognized opening or development of play.

STAR MOVE—A move designed to compel victory or prevent loss for the player making it.

Lakes of Peru, Long Cache of Inca Treasure, to Yield Gold Conqueror's Perfidy Lost?

Hundreds of Millions of Dollars in Pure Metal, Fashioned in Ornaments, Lying at Bottom of Sacred Lakes in Central and South America

By WILLIAM A. M'GARRY

THREE HUNDRED MILLION DOLLARS' worth of pure gold is lying at the bottom of sacred lakes in Central America and Peru, or buried in caves in the mountains of those countries. For 300 years, since the Spanish invaders gave up the quest of that wealth after sending back to Spain more than $83,000,000 in golden ornaments and bullion, the precious yellow metal has been awaiting the fortune hunter, but not one concerted, well-financed effort has been made to locate the treasure.

In one of those sacred lakes there is a huge chain of solid gold, as thick as the anchor chain of a ship. It was once strung from posts around the palace of the Inca at Cuzco, Peru. It was so heavy when removed that 200 Indians were required to carry it. The carriers were on the way from Cuzco to Caxamarca in 1532 to deliver the chain to Pizarro, one of the Conquerors, when they learned that the king it was intended to ransom had been strangled, so they abandoned their journey and threw what is now a fortune into the lake.

Four hundred other Indians in charge of as many pack loads of gold were trooping over the mountains to pay the ransom of the Inca, and they, too, threw tons of golden ornaments into lakes or hid it in mountain caves. Since then millions of dollars' worth of those ornaments have been picked up in small lots here and there, but although three centuries have passed, not more than a negligible part of the total treasure has been discovered.

If the foregoing summary had been taken from some work of fiction its truth might well be doubted. But as a matter of fact it is drawn from a report by a scientist of international standing and reputation, Dr. William Curtis Farabee, curator of the South American Section of the University of Pennsylvania, one of the noted ethnologists who helped to remake the map of Europe after the World War. It is based not only on the knowledge Dr. Farabee has acquired from books in becoming a world authority on the ancient history of South America, but also on the information gleaned in three exploring expeditions during which he discovered 20 tribes of Indians never before known to civilization.

Dr. Farabee is now again in South America at the head of an expedition that may yield millions in ancient golden ornaments. The occasion for his report on the prospects was the fact that the museum had obtained by purchase two great collections of South and Central American gold, which together make the largest in the world. The value of the two collections has been estimated at five million dollars. But in the days when it was fashioned into all sorts of ornaments it was as plentiful relatively as silk is today.

One collection was obtained by Dr. George Byron Gordon, director of the museum, in Paris. It contains examples of all the ancient American gold-working civilizations from Mexico to Peru, and is of particular interest because it consists of gold that was sent back by the Spanish Conquerors of those countries five hundred years ago. Since then it has been handed down through various families until it finally found its way into the possession of a wealthy Frenchman, who was forced to sell it because of the loss of his family fortunes.

The other collection consists of a group of objects recently excavated in the mountains near Ayapel, Antioquia, Colombia, where they had been buried by the Indians in some remote time. It is described by Dr. Farabee as the greatest discovery of buried treasure that has taken place in South America since the days of the Conquest. A native farmer found the entire collection while digging fence posts. He came to a small mound with which he was quite familiar, but which he had never taken the trouble to excavate. It was necessary for him to dig a hole at the edge of the mound, and in so doing his spade struck a small pottery jar. That excited his curiosity. He dug farther into the mound and came to the edge of a huge, oblong pottery urn shaped somethink like a trunk. And the following is what he found when he opened it:

Three breastplates of thin beaten gold 22 inches across.

Five circular breastplates of beaten gold from 10 to 13 inches in diameter.

A girdle three feet long and seven inches wide, made of 138 solid gold bars each four inches long and from one-eighth to three-eighths of an inch thick.

Eight fan-shaped nose rings cast in solid gold, four and a half inches wide and two inches high.

Six solid staff heads in the shape of birds, a jaguar, a monkey—one of which is seated in a golden chair—all of gold.

Four handbells of gold two inches high.

Sixteen solid gold nose or ear ornaments of various sizes from a half to an inch and a half across.

Nine strings of gold beads, one made of 41 small bells, one of 26 bells, and one with 135 cylindrical beads.

Eight plain bracelets, one-eighth of an inch in diameter.

Ten gold nose ornaments.

Twelve discs or bosses of plain gold.

One funnel-shaped ornament three inches high and two and a half in diameter.

Gold arm band three inches broad embossed at both ends.

A helmet of plain gold, in fragments.

Six sheets of thin beaten gold 16 by 20 inches in size, with perforations by which to hang them on garments or walls.

All those pieces, wondrously wrought and embossed, are from the famous Chibcha Empire, invaded and destroyed by Quesada, who crossed the Opon Mountains, 6,500 feet in elevation, with 200 men and 60 horses. It is a matter of history that he landed in 1535 at Santa Marta on the Magdalena River, and the terrible hardships he suffered before reaching the "Valley of Palaces" also is of record. At Chia the Conqueror found the palace of the Zipa, as the ruler was called, forsaken and the treasure gone. But at Tunja he got $600,000 worth of gold and silver and 1,815 emeralds.

"It is estimated that the ancient cemetery near Bugaba, Costa Rica, has yielded $50,000 worth of gold objects in the form of birds, frogs, fish, alligators and numerous anthropomorphic forms with human and animal elements combined," says Dr. Farabee, "the most common being the human body with the head of an alligator, jaguar or parrot."

According to the same authority, Cortez seized gold worth seven and a half million dollars from the palace of the Aztec king in Mexico. Pizarro got even more, in his conquest of Peru. "Learning of Pizarro's love for gold," says Dr. Farabee, "the Inca offered to fill the room in which he was confined with pure gold as a ransom for his freedom. The offer was accepted and the gold soon began to pour in from all directions. When the room had been filled to the height a man could reach, the cupidity of the Spaniards could stand the strain no longer. The gold, valued at ten to fifteen million dollars, was seized and divided among the leaders and the men in proportion to their stations. The royal fifth was sent to Spain under the care of Pizarro's brother. But the Inca, his ransom paid, was not released. He was tied to a stake, baptized and suddenly strangled with a bowstring.

"In the meantime Pizarro had sent a brother to Pachacamac, where he stripped the temple of 27 loads of gold, but he was unable to find the 400 loads which the chief had previously sent away for safety. When the news of the Inca's murder reached the pack trains bearing additional gold for his ransom, the men turned aside with their treasures and hid them away from the Spaniards.

"At Cuzco, the temple occupied one whole side of the great court. The cornice of the walls, a yard wide, outside and in was plated with gold, as were the inner walls also. At the eastern end a great plate of gold, representing the sun, spread from one wall to the other. This great image was not taken for the ransom, but when the Spaniards afterward returned to Cuzco, it had disappeared and it was never found. Ranged beneath this sacred symbol on golden thrones, dressed in their royal robes, sat the desiccated remains of the Inca Rulers. The High Priest wore a grand tiara which included a circular plate of gold representing the sun and a half moon of silver. His headdress was adorned with feathers of the macaw and covered with gold and jewels. His loose sleeveless tunic reached the ground. Over it was a shorter garment of white wool trimmed with red which came to his knees and was covered with plates of gold and precious stones.

"Besides the worship of the sun, the Incas had special personal deities in whom they placed great confidence. They were in the form of animals or birds some of which were of large size. That of Pachacuti was sent in pieces for the ransom. Each member of the royal family had his special deity which he called 'brother.' These were always buried with their owner. Some were found by the Spaniards, but that of Huayua Ceapac, a golden image of great value, was never found, although much sought after."

One figure, obtained by Pedro de Heredia from a temple in Darien, weighed 150 pounds. This explorer rounded up a golden treasure of $3,000,000 and missed perhaps 10 times as much. But it remained for Sebastian de Belalcazar to find the territory of the Quimbaya, the race of goldsmiths, adjoining that of the Chibchas, in Colombia. It is there, in the myriad lakes

Herewith are pictured ornaments and articles of gold in the museum collection of the University of Pennsylvania, including copper knife (at right) with solid gold handle, basket-work and hair ornaments.

Where Are the Reptiles of the Everglades?

Beautiful Homes and Profitable Trucking Come When Swamps Are Drained

By OLIN W. KENNEDY

THE Everglades of Florida are not what several million persons think they are. The picture that naturally arises in the minds of those who have not seen the Everglades is of a vast swamp, overgrown with saw grass and scrawny trees; in fact, of a land wholly unsusceptible to mastery by the hand of man.

The real picture is vastly different. Not only along the edges of the Everglades are there beautiful homes and productive groves and farms, but in the midst of the Glades are thriving towns and prosperous ranches.

Piercing the Glades are canals emptying into bay and ocean. These have drained the land to an extent where it is entirely susceptible of cultivation for all the tropical products usually produced in Florida. Most notable of these is that known as the Miami canal from Miami, through the Glades, to Lake Okeechobee. Another canal is being dug, alongside of which a highway known as the Ta-Miami Trail is being built. Over this trail, already 23 miles long, travel in automobile is not only practical but is considered by many a genuine pleasure as a sightseeing trip. An early morning trip is a revelation in bird life. Thousands upon thousands of birds and fowl of many varieties roost near the canal, where thirst may be quenched with water as pure as that from a mountain stream. On the approach of an automobile the thousands of birds will rise in flight as if a cloud had suddenly risen from the earth. The canal fairly teems with fish. Fishermen find the early morning a propitious time for landing bass and snappers.

Ta-Miami Trail, the name being derived from the first three letters of Tampa and the last four letters of Miami, has been projected as a thoroughfare between the cities of Tampa and Miami. Completion of the trail is promised by January 1. It will shorten the automobile driving distance between Tampa and Miami from 20 hours to 7 hours. The two cities look forward to the completion of the trail both as a means of travel for tourists between what are known as the East and West Coasts—from the Atlantic Ocean to the Gulf of Mexico—and as a thoroughfare for freight between the two ports. The Everglades' basin, extending from Lake Okeechobee to Miami and westward to the Gulf of Mexico, contains more than two and one-half million acres. The Everglades are larger than Connecticut and Rhode Island combined. The area is mainly surrounded by dunes of sand and ridges of limestone rock. The ridges are covered with pines. Between the ridges are small glades on the edge of the main or big glade. Before the canals were dug, what are known as hammocks appeared to be small islands. Now these hammocks are not unlike the rolling ground of the middle states.

The proposition a few years ago to drain the Everglades was met by derision. It required unusual efforts to obtain resources from the state for the venture. It was predicted by many that it would be impossible to drain off the water sufficiently to protect any considerable area from overflow. In the opinion of the opponents of the drainage plan the Everglades would forever continue a dreary waste of bog and morass. Not only has the drainage system proved successful in taking off the water, but in some instances the land somewhat removed from the canals has become so dry as to require irrigation.

Everglade land which but a few years ago was a swamp is now selling at prices higher than much of the farm land in the North. It is rather difficult to write about the reclamation of the Everglades without being accused of being a land boomer. Properly to describe the reclamation it is necessary to picture both beautiful gardens and modern cities.

On the shores of Lake Okeechobee are four prosperous and growing towns—Okeechobee, Pahokee, Moorehaven and Clewiston, but more remarkable than all of these is the city of Hialeah, on the eastern side, several miles from Miami. Less than two years ago Hialeah, which is now a city of several hundred houses, was only a ranch. Not only is Hialeah now a city of beautiful and modern homes, but it is the center of the motion picture industry of the South. Hialeah boasts a studio that accommodates 12 motion picture companies at one time. Pictures made in this studio are now being shown throughout the country and some notable stars will use it this winter.

A few miles north and west of Hialeah, a one-thousand-ton-a-day sugar mill is being rushed to completion, while within a few miles of the mill thousands of acres of sugar cane is developing for crushing this fall. The sugar mill owners did not start construction of their mill until after a four years' test of the sugar cane. In all directions in that vicinity ranches and groves are dotting the prairie-like country.

About and below Lake Okeechobee, around which it was believed that all kinds of horrible reptiles and animals had their home, and that miasmas and yellow fever and mosquitoes made it impossible for man to live there, are civilization, cultivation, happiness and contentment. Indeed, so fast is the settlement of Glades lands going on that the real problem, the only thing hampering progress, is the lack of sufficient transportation facilities to move the harvests. Miami and West Palm Beach, both on the east coast, are competing for the first railroad across the Glades.

Actual cultivation around the lower part of Lake Okeechobee this season consisted of 7,500 acres, and the production from that acreage was:

Potatoes, 125,183 crates; corn, 71,051 bushels; tomatoes, 267,890 crates; beans, 171,360 hampers; peas, 8,730 hampers; cabbage, 7,008 packages; peppers, 8,270 packages; eggplant, 13,401 packages; onions, 16,769 packages; fish, 75 tons; chickens, 5,475; eggs, 1,800 dozen; hogs, 876, and only slightly less quantities of other produce. This is exclusive of the produce for which there were no transportation facilities. This report was from 276 landowners.

Above—A canal, known as the Miami, 70 miles long, pierces the Everglades.

Circle—The home of Arthur Pryor, bandmaster, just completed in the Everglade city of Hialeah, cost $15,000.

Below—The city of Hialeah, in the Everglades, now the center of an extensive motion picture industry.

There is one railroad running down the state's center to the southern point of the lake.

Hard roads for automobile travel are gradually being built in. From both sides the distance is being lessened each month between the termini of the finished highways. Water transportation facilities are also provided, the canals from the east coast, and the one from the west side, being able to handle considerable freight and some passenger traffic all the year round

An example of what can be done by a family in moderate circumstances toward making an attractive little home in the Everglades is shown in the work of Mr. and Mrs. J. H. Steer and their son, Earl.

The place is located on the canal near Clewiston. Mr. and Mrs. Steer are natives of England and on first approach one perceives an atmosphere of the home country.

A row of mulberry, papayas, bamboo and palm intersecting each other on both sides cuts the places off from the fields on either side. From the canal bank a maze of crisscrossing white shell walks lead through little garden plots where dozens of flowers bloom, both of the northern and the tropical varieties.

Back of the garden and directly in front of the house is a green of St. Augustine grass always kept cut close to the ground and forming a turf that would be the envy of any golf ground keeper. On either side of the house is a row of shade and fruit trees and a clump of giant bamboo that will attain a height of 80 feet, it is said, at maturity. In the rear is another garden with fig trees and a nicely started grape arbor with several varieties of grapes now reaching the bearing age.

The house itself is a pleasantly designed building of five rooms. It was built 10 feet from the ground and this brings it up into the clearer atmosphere where it is more easily reached by the breeze. And undoubtedly the porches of the Steer home are as pleasant a place at any season of the year as can be found anywhere. They are almost unbelievably cool and delightful on summer days and only seldom in winter is it too cold to sit out in the open.

Just 18 months ago the land was cleared and this house was built. In that short time the trees set out have in many cases attained a height of 20 feet. The flowers and shrubs are thriving and one would think the ground had been cultivated a score of years rather than one. An indication of the variety they have growing is given in the following partial list:

Trees: Catalpas, papayas, bananas, Washington and coco plomossa palms, California pepper trees, paper mulberry, Royal Poincianas, figs, eucalyptus, an unnamed variety that is very pretty with fine leaves and yellow flowers, constantly in blossom, and several others that escaped our eye.

Plants and shrubs: Hibiscus, giant and variegated bamboo, roses, red cannae, ribbon cane or gardener's garter, poinsettias, Spanish bayonet, elephant ears, grapes, guavas, date palms and many others too numerous to mention.

On the southeastern shore of Lake Okeechobee there is a thriving little farming community of 2,000 persons and 50 tractors—Pahokee—that is growing by leaps and bounds and producing so fast that it would seem it has mastered the golden touch that old King Midas failed to bring under control. In four years it has made wealthy men of farmers who went there soon after the fertile muckland was drained with hardly enough cash to make the first payment on five or ten acres. In this short time its production and population have doubled every year and the farmers are so optimistic that they refuse to estimate a limit on next year's crops. This season they have shipped more than 1,500 cars of vegetables, their returns on tomatoes alone amounting well over the $100,000 mark.

The variety of fruits and vegetables raised is really remarkable. Bermuda onions, as many as 900 bushels to the acre, were raised last year and brought $5 a bushel. There are about 1,000 acres of tomatoes, and another 1,000 acres of sugar cane is under cultivation. String beans, Irish potatoes and sweet and field corn are alternated with the tomatoes, being planted as each crop begins to go down. There is sweet corn in April and field corn six feet high that was harvested in July. On one acre of beans this year, one farmer's gross receipts were $1,896.12. English peas, which bring as high as $8 a hamper and lima beans, selling at $7, are grown, pineapples are being experimented with and they are said to grow into large fine fellows with an excellent flavor. Many acres of avocadoes are being developed and there are trees four years old from the seed, now 20 feet in height, that have yielded as high as 1,000 pears to the tree. Acres of bananas, the equal of any grown, are being raised. Peach trees three years old, five inches in diameter and 12 feet high, have borne big, red fruit on the 18th of April. Besides these, there are lemon trees three years old that are loaded the year round, lime, orange and grapefruit groves.

Every farmer has his field of cattle, hogs and chickens and many of them bees. Gristmills, here, too, are common sights. With all these things, the farmers have grown to be almost independent of any other section. Grocery bills of some last year did not exceed $7 a month and they skimped not a bit.

The country surrounding the city of Okeechobee and

Spirit of Jesse James Goes Marching On

Glorification of the Outlaw Reflected in City Banditry of Today

By E. B. CHAPMAN

A WELL-DRESSED, well-mounted stranger, carrying two six-shooters in a belt, stopped at a village near Nashville, Tennessee, one day in 1881. Entering a small restaurant he ordered oysters and liquor. As he drank and ate he became abusive. When the marshal told the visitor he was under arrest the visitor put his hands on the six-shooters and said:

"Stand back. I'm an outlaw. My name is Tom Hill. Don't try to arrest me."

A young Tennesseean, with the marshal, seized the stranger's arms so that he could not use the six-shooters. The bad man was subdued, disarmed, taken to jail and searched. A money belt he wore yielded $1,800. It was part of the loot that had been taken from an army paymaster at Muscle Shoals, Alabama. It was believed then the stranger was one of the robbers and he was held.

The young Tennesseean did not dream that he had captured Bill Ryan, second only to Jesse James himself in desperation, bloodthirstiness and daring in the most notorious band of robbers the world has known since the days of Robin Hood. A score or more of men had been killed since the Civil War trying to do what he had done. And history records only that his name was Earthman.

Thus was the first step taken toward breaking up the band that had terrorized the Middle West 15 years.

Ryan had been living with Frank and Jesse James, and Dick Liddil, near Nashville, following the disastrous attempt to rob the bank at Northfield, Minnesota. He was known as Tom Hill, Jesse James as J. B. Howard, Frank James as B. J. Woodson and Liddil as Charles Underwood. When they learned Ryan had been arrested and had disclosed his identity, they fled to the home of an uncle in Kentucky and later West to their old haunts, near Kansas City, in Jackson County and Clay County, Missouri. There hundreds of friends, formerly associated with them under Quantrell, were ready to give aid.

With their return, the robbery of banks and trains became frequent. Men sent out to find the robbers invariably were found slain. It was customary to profess ignorance as to who committed the crimes. The bandits had visited terrible vengeance upon those who had "talked too much."

William H. Wallace, a young Democrat who was a candidate for prosecutor of Jackson County, startled an audience in the eastern part of the county in a campaign speech one night.

"People tell you they don't know who is committing these robberies," he said. "I know. I'll tell you. It is Frank and Jesse James, Dick Liddil, Ed Miller, Bill Ryan and another whose name I do not know. I know who they are and if I am elected prosecutor I'm going to send those fellows to the penitentiary."

After the meeting there was talk of hanging the candidate. He was warned the next day not to repeat the speech. He repeated it. He continued to repeat it. And he was elected.

Soon after his election came the arrest of Ryan. When the Kentucky authorities learned the identity of their prisoner they gave him to Missouri for trial. He was the first train robber to be tried, the first of the James gang to be captured, and the first of the men Prosecutor Wallace had promised to send to the penitentiary that appeared before a jury.

Perhaps such another trial never was held. Friends of the gang, many of them guerrillas of the border to whom the sight of blood and death was no novelty, came by the score. They jammed the courtroom day after day, sleeping on the courthouse grounds at night to be on hand early the next day. Others couldn't get places. In his plea to the jury, when that came, Prosecutor Wallace often struck them with his hands when making gestures. They were armed and menacing.

Railroad officials, whose companies were chief sufferers at the hands of the gang, gave little help. They urged on Wallace the uselessness of the hearing.

Wallace issued attachments for the witnesses. But they were of no value. They couldn't remember, they couldn't identify anyone. One was so terrified he wouldn't speak above a whisper. When finally released he actually trotted away.

Sky rockets sent up at night signalled this news and that to Jesse James and his gang, hiding near by. Messages were received by Wallace and others threatening their lives if Ryan was convicted. But the task of obtaining a jury proceeded until it was completed.

There were reports of plans for a rescue by the band. Wallace had seen to that. Captain M. M. Langhorne, former Confederate soldier in Shelby's brigade, was selected to guard the prisoner. Jesse James knew Langhorne's courage was equal to that of any man and that he could and would shoot straight and rapidly. There was no attempt at rescue.

The chief witness against Ryan, tried for participating in a train robbery at Glendale, Missouri, a short distance from Kansas City, was Tucker Bassham. Bassham had been a member of the gang that night. A green country boy, he had been picked up by the band because six men were required in their scheme of train robbery and there were only five in the gang. Dropped by the bandits after the robbery he was arrested, confessed and was sent to the penitentiary. He was pardoned to testify against Ryan. His part in the robbery had been to load and fire a shotgun to frighten passengers. Bassham told in detail of the robbery. The feeling against him was so intense his house was fired and his family forced to flee while the trial was in progress. A man as daring as Langhorne guarded him throughout the trial. After it ended he took his family and fled.

Besides Bassham, the express messenger testified.

Ryan was convicted, sentenced to 25 years in the penitentiary and hustled to prison.

JESSE JAMES

House in St. Joseph, Mo., where Jesse James was killed. At the left, Judge W. H. Wallace who prosecuted Frank James.

For the first time in their bloody careers the members of the James gang began to get acquainted with a new enemy—fear. It had been demonstrated a member of the gang could be convicted. The foreman of the Ryan jury had been an ex-Confederate soldier. That showed the "lost cause" wouldn't save the robbers if they were caught. Memories of Quantrell's gang didn't appeal to the former soldiers.

"The verdict struck terror to the boldest band of cutthroats the world ever had known," Judge Wallace says. "Immediately following the trial Langhorne, and other men as daring and determined, formed posses and began beating the brush for the bandits. They didn't know it but their race was run."

Associates told later how Jesse James began to fear his own men. He was afraid they would deliver him to the law to buy their own pardon, much as Bassham had done in the Ryan case. His suspicion fell on Liddil and Liddil fled. Then Jesse was convinced he was right. He sent word to Wood Hite, James's cousin, to kill Liddil on sight, saying he, Jesse, would kill Liddil if he saw him first. Liddil and Hite stayed at the same farmhouse one night, unbeknown to each other. As Hite came down the stairs the next morning Liddil and Bob Ford, now taken into the gang and destined to play an important part, fired. Hite fell dead.

Then Liddil opened negotiations for a surrender. He offered to assist in wiping out the band in return for a pardon, just as Jesse suspected he intended to do. Through Martha Bolton, a sister of Bob and Charley Ford, arrangements were made and Liddil gave himself up to Sheriff Timberlake of Clay County.

The plan made for the capture of Jesse James, for whom rewards running into thousands of dollars, dead or alive, now had been offered, hinged upon still further treachery in the gang. Bob and Charley Ford were members of it, with Jesse under the name of Howard, in St. Joseph. They were planning to rob a bank at Platte City, ostensibly, but really awaiting a chance to get word to Sheriff Timberlake where Jesse might be found and taken. The frightened, wary bandit chief, however, watched them so closely they could not give the signal for Timberlake, waiting on a special train, near St. Joseph, to come.

But let Bob Ford tell the story of what happened, as he told it later:

"On the morning of April 3," he said, "Jesse and I went down town to get the papers. We were to go that night to Platte City to rob the bank and I had made up my mind that I was in for a raid on the bank sure enough. We got back to the house at eight o'clock and sat down in the front room. I looked over the Kansas City paper and the first thing I saw in the headlines almost a foot long on the first page was the story about Dick Liddil's surrender. I had told Jesse I knew nothing about Liddil's whereabouts, and knew if he saw the paper he would suspect my purpose. Just then Mrs. James came in from the kitchen and said breakfast was ready. My only thought was to hide the paper. Beside me was a chair with a shawl on it and quick as a flash I lifted the shawl and shoved in the paper. Jesse couldn't have seen me, but what did he do but walk right over to the chair, pick up the shawl and toss it on the bed, taking the paper with him into the kitchen.

"It was fate. While Mrs. James was pouring the coffee Jesse opened up the paper and saw the headlines. He looked across at me with a glare in his eyes that I knew meant death—I had seen it there before. 'Young man,' he said, 'I thought you told me you didn't know where Dick Liddil was?' I told him I didn't know, that it was all news to me. But I knew he didn't believe me. I expected the shooting to begin right then and there. But Jesse was foxy and cunning. I could see that he was making up his mind to throw me off my guard and get me later. I could read that in his mind. I knew he was not going to kill me in the presence of his wife and children but I knew just the same I was a marked man. He was not the kind that took chances. So his game was to throw me completely off my guard. I went into the front room pulling my gun around within easy reach. He followed and began joking.

"All at once he looked at a picture and said, 'That picture is awful dusty.'

"He had a belt around him with four guns in it—I never saw it off him. He unbelted it with a quick, nervous movement and tossed it on the bed. I could hardly believe my eyes. But there came to me immediately the thought—he is doing this to show his confidence in me. I knew then it was either his life then or mine later. He stood upon a chair and started to brush the picture with a little brush. I said to myself, 'It is now or never, if I don't get him now he'll get me tonight.' The thought and the movement of my hand were simultaneous. I pulled and shot, cocking the gun as quickly as I leveled it. He turned his head at the sound but the bullet caught him just behind the ear and I knew when that bullet struck it was all up with Jesse"

Of course, the Fords were pardoned immediately.

Meanwhile, Clarence Hite, another member, had been convicted and sentenced to the penitentiary. Ed Miller had been killed by Jesse James. Only Frank James remained and there was a reward of $10,000 for him, dead or alive. A surrender was arranged and he gave up his pistols to Governor Crittenden at Jefferson City, being returned to Kansas City for trial on a charge of murdering a detective. Instead of being tried on that charge he was taken to Gallatin and tried for the murder of a passenger killed when a train was robbed. He was acquitted after a trial which eclipsed even the Ryan case. A judge laid aside his ermine to defend Frank James. A carefully selected jury, picked by the sheriff from a list given him, heard the evidence. The addresses to the jury still are kept as classics throughout the Middle West. But James was acquitted.

The surrender of Frank James ended the gang. That was 40 years ago this October. Jesse was killed 40 years ago last April. The James gang was no more.

But the spirit of Jesse James goes marching on, according to Judge Wallace. Banditry today traces back to the operations of this gang of robbers.

"Songs were written extolling them," he explains. "Stories of their daring handed down from generation to generation. Books by the score told of their prowess. Sensational weeklies named after them purported to recount their exploits. The youth of country and city grew up on these things."

The deeds of modern bandits make the exploits of the James boys, at this distance, seem less daring. The amounts stolen today make the earlier robberies seem the work of "pikers."

"The men committing the robberies now are just as they were then," Judge Wallace says. "They are young, smart, unwilling to work, and desperate."

How Heavy Is the U. S. Mortgage to Europe?

A Startling Challenge to the Propaganda That We Are "A Creditor Nation." Facts That Cannot Be Ignored

By W. H. ALLEN

IMMEDIATELY after the close of the World War the great bankers concocted a scheme to promote the work of reconstruction with the financial assistance of the United States. Europe was to furnish the brains and the leadership, and our government was to put up the cash. The scheme is explained and defended by Professor John Foster Bass in an article on "America and the Balance Sheet of Europe"; in which *it is contended that we are a creditor nation,* having bought back practically all the American securities held in Europe, and now, to put the world on its feet again, we must cancel the Allied debt, contribute a portion of our gold reserve for the restoration of the gold standard in Europe, and make additional loans for purely reconstructive purposes.

As I happen to be the original and most persistent opponent of the claim that we are a creditor nation, I may say that the parties who are behind this scheme to help Europe at our expense are most in need of advice. They are the prime movers in the campaign of education to warn the American people against the so-called "printing press theories of money." They masquerade as American bankers, but they are more properly known as foreign bankers, because *they represent foreign interests;* and their schemes to aid Europe and to combat "printing press money theories," are in behalf of foreign interests against the welfare of the American people. *A recognition of the fact that these bankers represent foreign not American interest will go far to unravel the most important financial problems of the day.*

These bankers originated the several claims, exploited by Professor Bass, to the effect that (1) we have bought back practically all American securities, that (2) we are a creditor nation, and rich enough to cancel the Allied debts, and lend much of our gold to restore the gold standard to Europe.

They Were Wrong Once Before

THE same bankers originated the claim of liquidation in 1893.* They asserted that foreign investors were returning our stocks because they had become alarmed over the Silver law. But it was shown that at that time foreigners actually bought more of our stocks than they sold.

Again in 1898 and 1901 these same bankers exploited the claim of foreign liquidation. Frank A. Vanderlip (one of the great authorities cited by Professor Bass) claimed that in these four years this liquidation amounted to $1,200,000,000. But I showed that instead of this huge liquidation, foreign investors actually bought more than $600,000,000 more of our stocks and properties than they sold. Mr. Vanderlip was more than $1,800,000,000 out of the way. And neither he nor any one else has ever attempted to disprove my figures. At that time, these bankers originated the claim that *we had become a creditor nation,* Europe owing us several hundred million dollars. *But in the summer of 1901, it came out that American bankers had been borrowing large sums abroad!* They had borrowed more than $250,000,000!

The scheme to help Europe includes *a restoration of the gold standard.* But these bankers made such a poor fist of it when they established that policy here in 1900, that the chances of their success in Europe are mighty slim. When they were advocating the gold standard they told us that it would do away with high money rates, panics, clearing-house certificates and revive our credit abroad. But every one of these predictions fell far short of fulfillment. The only real effect of the currency act of 1900 was to encourage that extravagance which has been the chief cause of our financial troubles ever since.

How Much of United States Does Europe Own?

AND these are the authorities who now tell us, through Professor Bass, that we are a great creditor nation, and can afford to cancel the Allied debts and lend millions of our gold to put Europe on its feet again. The basis for this estimate of our financial strength is to be found in a statement of our pre-war debt which was compiled in 1915 at a conference of bankers of which Mr. L. F. Loree was chairman. This statement showed foreign investments in the United States as follows:

British investments in U. S.	$2,800,000,000
French investments in U. S.	150,000,000
Dutch investments in U. S.	150,000,000
German investments in U. S.	150,000,000
Total foreign investments in U. S.	$3,250,000,000

This table is ridiculously below the actual figures, as the following facts will show:

Late in 1916 German bankers gave it out that Germany had withdrawn about all her investments from this country. The *Post World* and other newspapers indorsed this view; and the *Tribune* (February 7, 1917) quoted "one of our foremost foreign exchange bankers" to the effect that German investments here at that time did not exceed $50,000,000 and her cash resources were not more than $5,000,000. *But a few months later when Alien Property Custodian Palmer got busy he found German property here to the value of $750,000,000.* And Mr. Palmer didn't half look—he merely scratched the surface. A more thorough search would have revealed German-owned property worth many times that amount. *But what he did find was $300,000,000 more than the bankers had allowed for all Continental Europe.* It was five times as much as they allowed for Germany alone; and it was 15 times as much as the *Tribune's* banking authority had allowed only a few months before.

This was enough to prove that the Loree estimate was utterly worthless not only as to German, but as to all other investments. Writing of this matter in *Woody's Magazine* (July, 1915), I estimated that foreign investments here amounted to not less than $17,000,000,000, and from information gathered before 1914 I am convinced that this figure was not too high.

Discussing British investments in 1908 Francis W. Hirst, editor of the London *Economist*, reported that American stocks having a par value of $9,000,000,000 were listed on the London Stock Exchange. Allowing the usual difference of 15 per cent between par value and actual value, our debt to England at that time was $7,500,000,000. *England could withdraw that from us. She owned it and we owed it.* We were that much in her debt. That amount of property in the United States was not American but British. This does not include the vast sums in finance bills, short-term notes and long-term bonds held in the strong boxes of English investors. Short debts in the sum of $1,310,000,000 came due in 1914 and 1915.

As Mr. Hirst's figures of listed stocks were taken from official records they could not be disputed. Dutch investments in our stocks were officially reported at $240,000,000 in 1900, and $750,000,000 in 1908. French investments, in 1900, placed at $120,000,000 must have grown rapidly, for between 1906 and 1912 they placed $500,000,000 in our securities. As to Germany, Dr. Von Gwinner, the eminent financier, reported in 1911 that $450,000,000 of her surplus capital was going into our securities *every year.* Dr. Delbruck, another high German financier, stated that there was no way to prevent these investments; but he did not dispute the correctness of Dr. Von Gwinner's figures.

The amount of foreign capital in our country is a debt, it represents what we must pay—it can be taken out of our country whenever the owner of it so determines. And the point to emphasize here is that it is a debt which grows out of a debt. It is a case of borrowing to pay debts. Sir George Paish ("Trade Balances of the United States") tries very hard to prove that these investments are of benefit to us. He makes no distinction between the case of a man who mortgages his plant to enlarge his business and the prodigal who mortgages his estate to pay extravagant debts. The former gets the temporary use of cash to buy raw material, and so on, while the latter gets his cash to be paid over to his creditors. The one increases his power to produce more wealth; the other decreases his power to produce wealth. Most of the foreign investments of the 40 years are the result of our annual foreign debts for interest dues, tourists' expenses, alien hoards and ocean freights, and so on.

Who Owns American Railways?

AN AVERAGE banker's estimate published in the *Wall Street Journal* in 1913 placed these debts at *$1,400,000,000 a year.* With favorable trade balances of $500,000,000 *we were running behind $900,000,000 every year.* Instead of exporting gold in settlement of this deficit, we sold finance bills and short notes. This is usually called our short debt to Europe. But when any part of the amount due on the deficit is invested in long-term securities or in our properties, it became *our permanent debt abroad.* This is how the pre-war debt grew. Taking Mr. Hirst's figures of British investments and those of Dr. Von Gwinner for Germany as a basis, and the fact that we were piling up this deficit of nearly a billion a year, there are valid reasons for the belief that *our pre-war debt amounted to fully $17,000,000,000, or more than five times as large as the banker's estimate.*

According to the National City Bank Bulletin, January, 1919, foreign investments in this country on that date did not exceed $1,000,000,000. This estimate is, of course, based (1) on the assumption that our pre-war debt was only $3,250,000,000 (see table above) and (2) that foreigners have withdrawn $2,250,000,000 of this capital from our country. But no facts are presented to verify the claims of such withdrawal or liquidation. Most of the reports to that effect were followed by contradictions. Thus in the *World* (November 28) the *Post* (November 30) and the *Tribune* (December 16, 1914), I find reports of London, Paris and Amsterdam buying our stocks and short-term notes. In the *Evening Sun* (July 16, 1915) a prominent broker expressed the belief that "not at any time has there been the extensive foreign liquidation that has been reported." Two days later the Brooklyn *Eagle* stated that "Europe has at no time sold our stocks in the volume we have been led to expect." After exploiting liquidation for a whole year the *Times* (March 22, 1915) says, "In at least some directions they ('foreigners') have increased their holdings. Thus, the Pennsylvania Railroad reported that it had on its books 160 more stockholders than at the same date in 1914." If there is one equally clear case of foreign liquidation in that period it has escaped my notice. The *World* had outdone all the other papers in exploiting the liquidation claims, but it often publishes some facts which point the other way. January 20, 1915, it is stated in big type that "foreign bankers are resorting to every possible expedient to avert exports of gold in payments for commodities." Then, in an adjourning column, under the head of "Europe Buying American Securities," it states that, "in spite of the fact that demand sterling was at 4.83½, a condition which ordinarily encourages foreign liquidation, Europe is buying, rather than selling, American bonds and stocks." Five months later, the *World* reports that, "Instead of decreasing their holdings of American stocks, investors in France and England have been substantially increasing them." Study of financial history of the next three years of war shows the same results. There is more proof of an increase of foreign investments.

If liquidation had reduced foreign investments from $3,250,000,000 to $1,000,000,000, the effect would appear in a changed control of our great railroads, and in a decreased activity of the foreign bankers, who are agents of foreign investors. But all the evidence points the other way. One very clear case was seen in *the retirement of the American Goulds from* the control of the Missouri Pacific Railroad in 1915, *and the entrance of Kuhn, Loeb & Company, and Blair of New York, and the Deutsche Bank of Berlin* to the control of the road. The two firms are just as much agents of German capital as is the Deutsche Bank. As to the other bankers who are known as agents of foreign investors, Speyer, Seligman, Ladenberg, and Thalmann, all of them were just as influential at the end of the war as they were at the beginning. And they are still more influential today.

Our Enormous Interest Payments

THE National City Bank authority makes a big mistake when it leaves out of the account our foreign debts incurred during the war period. Having "bought back practically all our securities," as Professor Bass puts it, the item of interest due is considered unimportant. But there is much to prove that it was a very large item. It is well known that *foreigners made heavy investments in our mines and manufacturing plants* for the production of war supplies, and their profits on the same were enormous. They also earned higher dividends on all their investments in railroads, industrial enterprises, and so on, than in any former period. This item of interest dues was estimated by John E. Gardin, vice-president of the National City Bank, at *$500,000,000 a year before 1914,* and it certainly *was much larger during the war.*

Another factor left out of the account was the net unfunded balance of $2,057,000,000 in favor of foreign countries at the end of the war. After expressing surprise at the existence of this huge balance, the editor of the *Harvard Journal of Economics Supplement* (June, 1921), remarks that, "the cash balances in New York banks, and the credit of foreign government banks are known to have been very large at the end of the war." Early in 1919, it transpired that the *Bank of Japan* had $500,000,000 on deposit here, and the British-owned *Canadian banks* had $169,000,000 invested in call loans at New York. Possibly these two items are included in the "cash balances in New York banks." Assuming that this was the case, the account in favor of foreign countries at the end of the war was as follows:

Annual foreign debts for 4½ years ($1,400,000,000 a year)	$ 6,300,000,000
War expenditures abroad	2,000,000,000
Unfunded balances due foreign countries	2,057,000,000
Total	$10,357,000,000

Aliens Could Take All Our Cash

THIS is a very different showing from that which is presented by the bankers. But the events of the first year after the war tend to prove that it is nearest the truth. In February, 1919, Director Stewart of the Department of Labor, who had been instructed to look into the matter, reported that the amounts hoarded by aliens during the four and a half years of war reached the enormous total of $4,000,000,000 (four billions of dollars). The Savings Banks' section of the American Bankers' Association had faith enough in this report to form a "Stay at Home Movement" to urge the aliens to remain here. **If they all went away at once, it was declared that they would take all the gold and paper money in the national banks with them.** The National City Bank Bulletin, July, 1919, remarked that Director Stewart's figures were extravagant, but it gave no reasons for thinking so. As these hoards were estimated at $500,000,000 a year in 1913, as millions of alien laborers were marooned here during the war, and as these aliens earned from two to four times as much during the war as ever before, it is evident that the Stewart estimate was not very far out of the way.

Governor Harding informs me that so far as he knows there are no estimates of these annual foreign debts for 1914 to 1918. This is, indeed, an astounding admission. It gives an insight to the happy-go-lucky methods of solving international money problems which prevail in the highest financial circles. *It affords a good illustration of the methods of those who claim we are a creditor nation and able to cancel all debts, and lend millions of gold to Europe.* They magnify the assets and forget the liabilities. If our net exports

(*Concluded on page 15*)

Another View of the Turks and Their Menace

The Scene Is Afar, But the Affect of It May Be Felt Very Near Home:

The Meaning of the Recent Challenge to the Western World

By HERBERT A. GIBBONS

Editor's Note—The comment and challenge aroused by Mr. Bowerman's article in* THE DEARBORN INDEPENDENT *of October 7, finds authoritative expression in Mr. Gibbons' article, here printed. With these two views at hand the reader will be able to see why the popular conception of the Turk is held.

NOTHING is truer today than that Americans are sick of propaganda. In regard to our late comrades-in-arms and foes alike, we are a bit impatient about their troubles and their problems. For the impression is general that we did not get much thanks for intervening in the World War, and that its aftermath has demonstrated an incompatibility of temperament and a conflict of ambitions so hopeless and bitter that we are jolly well out of the whole business. Did we accomplish any real good by the sacrifices we made? If there is doubt as to the correct answer to this question, it is foolish to speak of a new intervention, this time in the Near East, where British, French, and Italian interests are clashing.

But the student of world affairs and international relations, as well as the humanitarian and the idealist, feels impelled to point out that we cannot be indifferent to what is going on in Europe and the Near East. Why "cannot"? Simply because the United States seems to have reached the place in her economic development where foreign trade has a direct bearing upon the prosperity of the nation, and also because most of the European nations are heavily in our debt. As manufacturers and agriculturists, with surplus products to sell, and as creditors with interest and principal of loans to collect, we are forced to interest ourselves in prospective customers and actual debtors. If the Near Eastern situation is leading to war or to an indefinite prolonging of the conditions that provoked the war of 1914, it is decidedly to our interests to inform ourselves of what is going on and to ask ourselves if anything we can do will prevent or mitigate evils whose harmful influence we shall be among the first to feel.

His View of Treaty of Sevres

THE Treaty of Sèvres, which the Conference of Lausanne has been called to renounce and to replace by another treaty favorable to the claims and demands of one of the nations vanquished in the World War, is a part of the general peace settlement. Much as our French friends would like to have it so, this document cannot be dissociated from the other. The question arises: Was the Treaty of Sèvres unjust in spirit and impracticable in its terms? If so, all the other treaties are unjust and impracticable. Or is the Treaty of Sèvres being renounced because the vanquished have become strong enough to defy the victors, and now refuse to abide by the terms of peace dictated to them? In this case, we see the handwriting on the wall. The Entente Powers, confessing their impotence, herald their willingness to give up the fruits of victory rather than fight again to retain them.

The facts in the Near Eastern situation must not be obscured by special pleading on behalf of Moslem or Christian, Turk or Greek. For some one to write that the general run of Turkish peasants is better than the general run of Greek bankers and shopkeepers or Armenian rug merchants is not to the point. Ever since 1914 one could have written about the general run of Germans what is being written today about the Turks. What we need to keep in mind is the great fact that people have to be held responsible for what their government does and that a nation's place in the civilized scheme of things depends upon its institutions and its accomplishments and not upon the affability of a few officials or the simple honesty of its peasantry.

Calls Kemalists Pro-German

IN 1914 Turkey entered the European War on the side of Germany, and stuck to her ally right to the bitter end. With very few exceptions, the Kemalist Turks were enthusiastic believers in Germany and the advantages their country was going to win by the feats of arms of the Germans.

The Turks prayed and worked and fought for the defeat of the Entente Powers and the United States.

If we read the speeches of their leaders and the editorials of the Angora press, and if we study the decrees issued by Kemal Pasha, we shall see that the Turkish Nationalists nourish an insane hatred of the British and are maintaining a close understanding with Soviet Russia.

They are directing the anti-European propaganda in the Arabic-speaking portions of the former Ottoman Empire, and have secret understandings with the Asiatic kings and princes and sheiks who have opposed consistently western ideas.

Do we want to invest our capital in these countries? Do we want to sell our goods to these countries? Or are we interested in the maintenance of our educational institutions, which represent and spread our political ideals and culture as well as our religion? The countries of the Near East will be barred to our economic or cultural penetration if the Turks have their way at the Conference of Lausanne.

Holds Facts Are Different

THREE misapprehensions are being spread in the United States by radical agitators, who see in the triumph of Kemal Pasha the ultimate triumph of Lenin in Europe and America; by anti-British, who rejoice in the discomfiture and the approaching peril to the British Empire; and by a certain number of well-intentioned but misinformed persons who believe that they are being fair and generous by espousing the Turkish cause. To correct these misapprehensions, I wish to point out that:

(1) *The Greeks were not carrying on an imperialistic war of aggression for the purpose of dominating Turkish lands.* Thrace, Constantinople, and Asia Minor (western part and back seacoast) were Greek lands from the earliest days of history. During the five years of Turkish domination the Greeks maintained their language and religion and formed a considerable element of the population. Smyrna was always called "the ghiaour (infidel) city" by the Turks. Its whole aspect was Greek. Though neither race has the actual majority, there are more Greeks than Turks in Thrace. Constantinople and the sea of Marmora have never lost their Greek population. The Greeks went into Asia Minor and Thrace at the invitation of Messrs. Wilson, Clemenceau, and Lloyd George, as representatives of the Allied and Associated Powers.

All Turks Not Kemalists

(2) *All Mohammedans are not Turks, and all Turks are not Kemalists.* The great confusion in statistics is due to the fact that they are based on religious, not racial grounds. The so-called Turkish population of Thrace and Constantinople is very much mixed. The Pomaks in Thrace, though Mohammedans, are Bulgarian in language and characteristics. Large numbers of Albanians are indignant when confused with Turks. The Circassians of Asia Minor and Thrace, whom Kemal Pasha includes in his population figures as Turks, not only hate the Turks, but made common cause with the Greeks against the Turks. The Arabs consider the Turks as cultural inferiors. The Kurds have always defied the authority of the Turks.

Many writers express their sympathy with the Turks on the belief that they are fighting for self-determination and that fanatical religious interests among the Christians have been the cause of a misrepresentation of the Turks to the outside world. In fact, the calamities of Turkey under the Young Turk régime have been due more to rebellions of Mohammedan coreligionists against Turkish oppression and pretentions to domination than to European or Balkan intervention. To prove this we have only to cite the Albanian rebellions of 1910 and 1911, and Arab rebellion of 1911, and the great Arab secession, led by the Sherif of Mecca, in 1916. This last event—a wholly Mohammedan affair—was the most powerful factor in the collapse of the Ottoman Empire. Even among the Turks themselves there is great dissension. When Kemal Pasha gets possession of Constantinople, foreigners and native Greeks and Armenians will not fear him as much as large groups of prominent Turks, including members of the imperial family.

(3) *In the massacres it is not a case of six of one and half a dozen of the other.* It is flying in the face of the truth to assert that Greeks and Turks or Armenians and Turks are equally guilty of atrocities. As an old campaigner, who has been through many wars, I do not put much stock in atrocity stories. For I know from personal observation that with an invading army it is human nature that is at fault. One regrets to have to say that all armies are guilty of atrocities, and that it is hard for the pot to call the kettle black. Greeks have undoubtedly been guilty of killing and pillage and burning. None denies that they have done bad things in Asia Minor. But what the world rightly pillories the Turks for is *their wholesale massacre and systematic and cold-blooded persecution and cruelty when and where no fighting at all was going on.*

Massacres Branded Deliberate

THE Turkish government, on several occasions, has deliberately planned and carried out the extermination of hundreds of thousands of its defenseless subjects. The massacres of 1893-95, 1909, 1915, and 1921-22 did not have the excuse of provocation, and they were carried on a stupendous scale under the direction of officials of the government. In every instance the evidence of guilt is overwhelming. When the Armenian who assassinated Talaat Pasha in Berlin was tried, evidence of Talaat Pasha's personal direction of the Armenian massacres in Constantinople was introduced. The German jurors broke down and cried, so horrible was the crime proved against the dead man, and they acquitted the Armenian student. Much has been said by Turkish sympathizers about the events on the day the Greeks landed in Smyrna in 1919. But less than a hundred were killed in that affair. When the Turks returned in 1922 they killed 100,000 and burned the town! (Concerning responsibility for the burning and extent of the killing, Mr. Gibbons offers no evidence.—Ed.)

The statements I have made above in endeavoring to correct the three misapprehensions are not given on secondhand authority. Ever since the Young Turk revolution of 1908 I have been in close touch with conditions in the Ottoman Empire. I lived there four years before the World War, and have been back and have traveled in the regions occupied by the Greeks in Asia Minor not long before their expulsion. I hold no brief for the Greeks in particular. But I feel very strongly that all the non-Turkish elements in the Near East have suffered too much from the misrule and persecution of the Turks to make possible a renaissance of the Ottoman Empire.

And, except in the interior of Asia Minor, the Nationalist Turks themselves are too few in number and too hopelessly mixed with those who have no faith in them and no love for their ideals to make possible the strong and united Turkey that is the Kemalist goal and that seems to call forth the sentimental enthusiasm of some who know neither the past nor the present of the Turkish race.

Little to Expect of Lausanne?

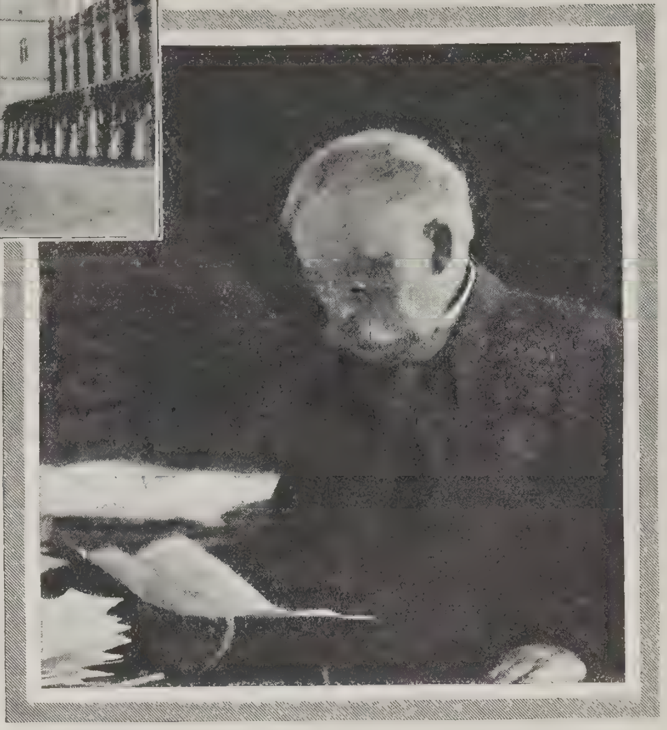
AND now, if what I say be true, there is little to expect of the Conference of Lausanne other than the beginning of the end of all the peace settlements made since the war. November 11 can hardly be celebrated as an event which changed the history of the world on the eve of a conference in which one of the defeated peoples asserts its right to reject the results of the greatest appeal to arms the world has ever known. The people of the United States, unaware of the gravity of the European situation and of how it is going to affect them, leave the task of putting out the fires that are causing the Near Eastern cauldron to bubble over to France, Great Britain and Italy. These fires, if not put out, will blaze forth soon into another world-wide conflagration. It goes without saying that we do not want to see that! But how are we going to be sure that the fires will be put out?

Historic Oxford Transplanted Upon an Illinois Prairie

University of Chicago Sets a New Pace in Higher Education

By J. V. NASH

Mitchell Tower, University of Chicago.



DR. HARRY PRATT JUDSON,
The second and present president of the University.

TO THE ordinary American, Chicago—bustling, noisy, aggressive Chicago, the home of the packing industry, and the country's greatest railroad center—would seem the last place on the continent where one might expect to find an American counterpart of the historic Gothic architecture and the academic atmosphere of Oxford.

It is one of the many paradoxes of the amazing Metropolis of the Lakes that structures as diverse as a great modern stockyards and university buildings redolent of the Middle Ages should rub elbows as friendly neighbors. Both institutions are located on the South Side of the city, within a few minutes' ride of each other by trolley or "L," and each is, in its own way, typical of the spirit of Chicago. Chicago's packing house products are no more nationally and internationally famed than its Doctors of Philosophy. Whether you are seeking physical or mental food, Chicago is prepared to supply your wants, in small lots or in carloads, quality guaranteed.

To get a "close-up" of the University one travels out to Fifty-seventh street. This is now a busy thoroughfare of shops, stores and studios. Back in 1890, this prosperous and well-built-up neighborhood was a wind-swept sandy prairie, the floor of prehistoric Lake Chicago, dotted with morasses from whose depths there arose nightly the doleful croaking of frogs, and clumps of gnarled, weather-beaten scrub oak trees through whose bleak branches the winter winds shrilly whistled.

As early as 1856, before the city of Chicago was 20 years old, provision for higher education had been made by its enterprising citizens. In that year the Hon. Stephen A. Douglas, whose name is so indissolubly linked with that of Lincoln in Illinois history, gave a tract of land between Thirty-fourth and Thirty-fifth streets—a location in those days "way out in the country"—as a site for a university.

This "Old University" had an interesting history of 30 years. It, however, had the misfortune to begin its career at an inauspicious time. Before it could graduate its first class the Civil War broke out, and the little college gave 100 young soldiers to the nation. After the war it made another start, and then the fire of 1871 temporarily wiped Chicago from the map. Followed years of nation-wide financial depression, beginning in 1873.

The trustees worked with heroic zeal to keep the institution alive, but it proved a losing fight. Money was sorely needed for rebuilding the city. The campus finally had to be mortgaged, the trustees could not meet the mortgage when it fell due, the property was sold by the holder of the mortgage (a large insurance company), the college buildings razed, and the land cut up into business blocks, the city meanwhile having grown southward around the university property. The curtain was finally rung down on the old university in 1886.

Connected with the old university, there had been a small divinity school which held property of its own in the southwest suburb of Morgan Park. When the university proper closed its doors, this divinity school still held on. Upon its staff at this time were two remarkable men—Thomas W. Goodspeed and William Rainey Harper. Dr. Goodspeed was secretary of the institution, and Mr. Harper, professor of Hebrew, from which he was called in this same year to a professorship at Yale University.

Dr. Goodspeed (hale and vigorous and in the service of the new university today at 80) had been a student at the old university as early as 1859, and naturally he felt its dissolution keenly. He believed that its failure should not be considered final, and that just as Chicago itself had arisen from the ashes and had entered upon a larger life, so the university should be reborn to fulfill an infinitely greater destiny.

There were innumerable conferences, there were hurried journeys to distant cities for interviews with men of influence, there was much figuring and planning. At last, in 1888, the interest of the American Baptist Education Society was enlisted and in May, 1889, the Society "formally resolved to take immediate steps toward the founding of a college in the city of Chicago."

The alliance with the Education Society was the turning point which assured the success of the project. The secretary of this organization, Fred T. Gates, was in touch with John D. Rockefeller, before whom, in company with Dr. Goodspeed, he placed in full detail the plans for a new University of Chicago. Mr. Rockefeller was at this time (1889) just 50 years of age and beginning to contemplate the making of large public benefactions.

Following a number of conferences with Mr. Gates and Dr. Goodspeed, Mr. Rockefeller agreed to subscribe $600,000 (a much larger sum in 1889 than now) toward an endowment fund, on the condition that $400,000 should be pledged by others before June 1, 1890. A campaign for the raising of the additional amount was immediately begun (it was probably the first large educational "drive" on record) and the sum, great as it was for those days, was soon raised. The result so impressed Mr. Rockefeller that shortly afterward he added $1,000 000 to his former subscription. In September, 1890, the University of Chicago was incorporated and a board of trustees chosen.

The university now had $2,000,000 in ready money, and it had acquired an ample campus site in the then open country between Fifty-seventh and Fifty-ninth streets. But it had no buildings, no president, no faculty, and no students.

It is at this point that William Rainey Harper appears again. This extraordinary young man was in 1890 but 34 years of age. He had entered Muskingum College in Ohio at 10, was graduated A.B. at 14, became a graduate student at Yale, and at 19 received the degree of Ph.D. from Old Eli. In the same year he married, and at 22 we find him established as professor of Hebrew in the Divinity School at Morgan Park, lecturing to students, many of whom were older than their professor. He was just 30 when called to one of the highest professorships at Yale.

At the first meeting of the board of trustees of the new University of Chicago, in 1890, William Rainey Harper was unanimously elected president, and took up the duties of his office on July 1, 1891.

This young educational and administrative genius created the University of Chicago as it exists today. A scholar of almost fabulous learning, to whom Hebrew, Greek, and Latin were as familiar as English, he was likewise a born administrator, and threw himself with a feverish zeal into the work.

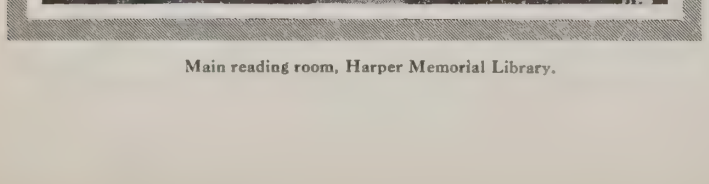
His first task was to collect a faculty and from the leading universities of the East, one by one, he enticed professors to Chicago. Not content with mere professors, he succeeded in bagging the presidents of several universities—President Robinson of Brown, President Chamberlin of Wisconsin, and President Small of Colby—as heads of departments. But even this did not satisfy him. He decided he must have some distinguished European scholars on his faculty. Professor Richard Green Moulton of Cambridge was in America on a visit. President Harper approached him. "Utterly impossible!" exclaimed the English savant when the proposition was placed before him. But President Harper could not take "No." Finally, the Cambridge "don" agreed to come to Chicago under a purely temporary arrangement—"just for a few months"—to help President Harper get things started. He remained 25 years!

From the University of Freiburg, Germany, President Harper secured, by means which apparently have never been explained, Professor Hermann Eduard von Holst, who had been a member of one of the German legislatures and was the author of a monumental "Constitutional History of the United States." He became head of the Department of History at Chicago. Professor Moulton retired after a quarter of a century as head of the Department of General Literature and returned to England, but Professor Von Holst after more than 10 years died in the service of the university.

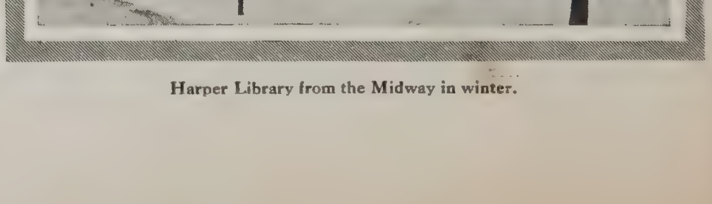
President Harper boldly threw overboard the old "academic year" from October to June, with the long three months' vacation in between. He did not believe in excluding students who could not attend college for nine months at a stretch, and he did not believe in allowing a valuable educational plant to remain idle 25 per cent of the year.

He, therefore, took the calendar year and cut it up into four quarters of approximately three months each, with a short vacation in September. At the beginning of each quarter, in October, January, April, and June, there is a general registration for courses. All the work is completed within the quarter and credit recorded.

Harper Memorial Library, erected 1910-12 at a cost of approximately $1,000,000.



Main reading room, Harper Memorial Library.

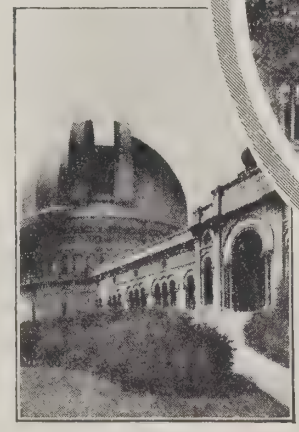


Harper Library from the Midway in winter.

Ida Noyes Hall, Women's Recreation Building, given by LaVerne Noyes, 1916.

Delta Kappa Epsilon, a leading fraternity, at the opening of college, October, 1922.

In the graduate quadrangle.



Yerkes Observatory Great Dome.

West Stand Stagg Field.

Then a student may register for more courses at the beginning of the next quarter, or he may drop out for one or more quarters.

The summer quarter is of the same length as the other quarters and offers courses of the same value as credit toward degrees. This furnishes an opportunity for thousands of teachers to supplement their earlier training by working for university degrees during the long summer vacation. By attending the university three quarters in each year, a student completes his college course in the regular term of four years. But an ambitious student may, by enrolling for four quarters annually, earn his degree in three years, thus saving an entire year's time.

Some humorist in the early days of the university compared President Harper's quarter system to an educational moving sidewalk. "You get on whenever you are ready and get off at just the point you want to reach." Then, too, the curriculum offered so many educational novelties, that jesters found great merriment in dubbing the new university "Harper's Bazaar." If cafeterias had been known in those days, an observer might have discerned a certain analogy between those useful modern institutions and President Harper's novel educational system.

From the beginning President Harper was resolved that the university should be frankly co-educational. This was an innovation which to educational authorities in the East appeared highly revolutionary. It would doubtless have been characterized as "bolshevik," if that handy term had been available in 1892.

Again, President Harper eliminated the old four-class arrangement—freshman, sophomore, junior, and senior—existing at other universities, and instituted instead the junior and senior colleges, the first including the freshman and sophomore years, the second, the junior and senior years. In the junior college the student's work is rather closely supervised, and his studies are largely a continuation of the high school curriculum.

Upon entering the senior college the student is introduced to work of true university character and is expected to plan his own program of studies. Upon completing the work of the junior college students are awarded diplomas at formal graduation exercises.

Such is the force of long tradition, however, that the old divisions have unofficially crept back, and today at Chicago you will find freshmen, sophomores, juniors, and seniors, just as at other universities, with their class officers and group activities.

Another of President Harper's innovations was the Correspondence-Study Department, by means of which the university broke through the walls of the campus and carried its educational service not only into every city and hamlet in the United States but to all the far corners of the earth. Through the Correspondence-Study Department students who are prevented from attending the university in person are enabled to pursue college courses, to prepare themselves for advancement in their chosen work or to obtain partial credit toward degrees.

President Harper established at Chicago the first university press in the United States, and the press has been one of the most flourishing departments of the university. Today all the great universities of the country maintain presses organized on a similar plan.

Chicago, likewise, was the first American university to organize its athletic work as a regular department of the university, giving to its head coach the rank of a full professor. Since the beginning the athletics of the university have been directed by A. A. Stagg, who won his spurs on the Yale field in the later '80's, and has been affectionately known to Chicago students for the last 30 years as "The Old Man."

At Williams Bay, Wisconsin, some 75 miles from Chicago, is located the great astronomical observatory of the university, with its marvelous 40-inch telescope, which is visited by thousands every season.

As the years wore on and the university began to run on well-oiled machinery, under its own steam, it might have been expected that President Harper would have welcomed a lightening of his labors. But his craving for work increased rather than diminished; in the course of time his activity became almost pathological in its intensity. Many stories are told of his extreme restlessness in these later years. He would pack his grip and catch an express train for New York, and, arriving at his destination, he would turn round and rush back on the next train. At last the goaded constitution snapped. He collapsed on the platform in the midst of Convocation in the autumn of 1905. The doctors diagnosed his disease as cancer of the stomach.

With uncanny prescience he predicted the exact day of his death and with his characteristic thoroughness and passion for doing things himself he prepared in advance all the details of his own funeral. And so when the final call came, on January 10, 1906, although not yet 50 years old, he could feel that his work was finished.

During President Harper's entire administration the second officer at the university had been Professor Harry Pratt Judson, who had come to the university in 1892 from the University of Minnesota. He became head dean of the colleges and later dean of the faculties. He had been President Harper's right-hand man, taking his chief's place whenever business called the latter away, and during the final illness serving as acting president. When the trustees met to elect a new permanent president there was naturally no other name to be considered. Dr. Judson was formally elected president of the university early in 1907. For 15 years he has guided its destinies with signal success, and the end of the university's thirtieth year of service finds him still at the helm. During his term of office the attendance at the university and its financial resources have more than doubled.

WILLIAM RAINEY HARPER,

First president of the University of Chicago.

The University of Chicago is still the youngest of great American universities; yet it has already, in its brief 30 years, matriculated 87,000 students, graduating 10,000 bachelors, 2,000 masters, 1,200 doctors of philosophy, and 600 doctors of law. From the initial $1,000,000, its assets have grown to $50,000,000.

The university was from the beginning not a local, but a national, and even an international institution. All sections of the United States, as well as many foreign countries, were represented by contributions to the original endowment fund. That the first graduate student to receive the degree of Ph. D. in 1893 was a Japanese—Eiji Asada—was prophetic of the new university's international mission.

In the first year, 1892-3, there were 744 students enrolled at the university. In 1920-21 the number was 11,385. The first year 31 degrees were conferred; in 1921 the number was 1,111.

While the undergraduate department has steadily flourished, special emphasis has been placed from the start upon graduate work, and today Chicago as a graduate university is rivaled only by Johns Hopkins.

Professor Albert Bushnell Hart, of Harvard, after a careful study of the large universities of America, has reached the conclusion that there are only six really national universities in the United States. These are Harvard, Yale, Columbia, Cornell, Michigan, and Chicago. "No great university," he says in the Harvard *Alumni Bulletin,* "is completely national unless it draws its lifeblood from all parts of the Union and sends that impulse springing back through a thousand arteries to the remotest states." He points out that most of our universities are local in scope, serving small sections of the country or limited groups of students. Speaking of Chicago, he adds: "It is the only northern university that has a strong hold on the South."

The alliance of the University of Chicago with the South has been one of the most interesting phases of its history, probably little known to the public at large. Last year there were enrolled at the university 1,216 students from the southern states. The attendance from Texas during the summer quarter is so large that the Texas delegation comes through to Chicago from the Lone Star State on two chartered trains. Harvard and Yale lost their hold on the South at the time of the Civil War, and the great body of southern students has never returned.

One of the most interesting and distinguishing features of the university is the architecture of the buildings. Whereas at most of our American universities the halls are of widely different design, and scattered about as though dropped from the sky, at Chicago an architectural plan was adopted by the trustees before ground had been broken for the first building. Into this plan, which has remained essentially unchanged, the buildings have been fitted one by one—they now number some 40—with most pleasing and harmonious effect.

The English collegiate or perpendicular Gothic, as exemplified at Oxford and Cambridge, was the architectural style adopted for the new university. The buildings have not been slavishly copied from the English models; the latter have served rather as a source of inspiration to the architects. The general effect is particularly suggestive of Oxford, as if the ancient university had been born again on the prairies of the West. The buildings are of Indiana limestone, originally white but gradually weathering to a bluish gray, capped with dark red roofs of composition slate. With the approach of spring the tender green of the climbing ivy envelops the walls, changing to crimson and russet as summer turns to autumn.

Such is the University of Chicago, the ultimate potency of whose influence upon the destinies of America and of the world one hardly dares to predict. As the visitor takes leave of those enchanted quadrangles, the lines of Edwin H. Lewis enshrine a mental picture never to be dimmed:

> "But yester-eve here closed the prairie flower
> Whose trivial beauty is forgot today.
> The plain has blossomed into hall and tower,
> And viewless dreams are visible in gray."

Guggenheim Ship Interests Take Heavy Toll of Alaska's Victims of "Public Be D–d" Policy

Would Do No Good to Let People Know Too Much, Bureaucracy's Argument

By THOMAS B. DRAYTON

THIS story, which is really an interview given THE DEARBORN INDEPENDENT by John Rustgard, attorney-general of Alaska, ought to be illuminating despite the circumstance that many supposed facts are not available; and, indeed, even the more important facts given in this interview seem to have been extracted by the attorney-general with great difficulty, as the following official communication would indicate:

DEPARTMENT OF THE INTERIOR
ALASKAN ENGINEERING COMMISSION

Anchorage, Alaska, May 4, 1922.

Hon. John Rustgard,
Attorney-General, Territory of Alaska,
Juneau, Alaska.

My dear Mr. Rustgard:

In reply to your letter of March 9, to the Honorable Secretary of the Interior, requesting copies of joint passenger and freight tariffs between Seattle and points along the government railroad, I am pleased to send you joint freight-tariff No. 30, and local passenger tariff No. A-18, which are the latest tariffs published for our guidance.

You request in your letter to the Secretary of the Interior a statement of the percentages or amounts of rates established paid to the steamship companies. This is a confidential agreement between the steamship companies and the Alaska railroad, and is not for general publication nor for the public. It would apparently answer no good purpose to give this out and would be a very distinct violation of the agreement arrived at.

Yours very truly,
(Signed) Frederick D. Browne,
Engineer in Charge.

To get a proper perspective from which to scan the attorney-general's remarks, and to give a fair and even break to the Guggenheim steamship people, to the bureaucrats running the government's railroad, and to the people of Alaska, a preliminary survey of the Alaskan shipping situation is necessary.

Guggenheim Owns Big Line

ALASKA shipping trade is monopolized by two steamship lines. The Guggenheim line is the big line and maintains a regular 10-day service ordinarily. The smaller line runs boats presumably as traffic offers, and copies Guggenheim rates identically, for both passenger and freight traffic. When, therefore, Alaskans discuss ocean transportation and ocean freight rates and allied matters they have in mind the Guggenheim shipping interests, which they regard as having virtually a monopoly in Alaskan waters.

The Guggenheim people claim to earn but *seven per cent* annually from their ships in the Alaskan trade. Alaskan shippers maintain that the Guggenheim ships pay *86 per cent* annually and have done so for many years. The Guggenheim people claim that Alaskan shippers have a cheaper rate than some other buyers of ocean transportation. The Alaskan shippers answer that Guggenheim service in Alaskan waters is, according to classification of merchandise, from 70 per cent to 183 per cent higher than any other ocean service.

The attorney-general, as will be seen, points out that the Alaskan Engineering Commission, the bureaucratic agency representing the United States Government in the operation of its Alaskan railroad project, has joined with the Guggenheim people in a joint traffic scheme to mulct the public out of from 17 per cent to 50 per cent in excess of former rates, and that this increased burden upon the people goes to the Guggenheims and not into the public treasury.

The Engineering Commission, as will be seen by the introductory letter, takes the position that it is none of the public's business what rates it fixes, and if the public doesn't like it—well, the public may take it or leave it alone just as it pleases.

An Interview With Rustgard

THE Alaskan people, on the contrary hand, maintain that they are vitally interested in rates exacted by common carriers, and have a moral right to be interested in such rates, seeing that excessive charges, in common with honest charges, are passed on down to the shoulders of the consumers.

Attorney-General Rustgard, admittedly one of the ablest men in the Territory, presents the Alaskan shipping situation to the readers of THE DEARBORN INDEPENDENT in the following authorized statement:

"After an examination of the joint freight tariff, fixing the rates of freight charges on through routing from Puget Sound points to Alaska points via the government owned and operated Alaska railroad and the present steamship companies, I find it my duty, as attorney-general for the Territory of Alaska, to request that an effort be made to secure a material reduction of the rates published, and to suggest a method by which a reduction may be secured.

"The proper rates for the government railroad haul are obviously those which promise the greatest return to the investor—the American people. What those rates should be, must, in the nature of things, be a matter upon which judgments differ, and my office has, therefore, no suggestion to make on that subject. The same observation, however, does not apply to ocean rates. The conclusion seems irresistible that the latter are unjustifiably high—so much so as to be oppressive and a material and unnecessary burden to the people of the Territory as well as a distinct disadvantage to the government railroad.

"The distance from Seattle to Anchorage is approximately 1,400 nautical miles. The basic charge (that is, the charge for general merchandise) on that route is $17.00 a ton in carload lots. On less than carload lots the charge is $18.70 a ton. It is probable that more than 90 per cent of the general merchandise will move in less than carload lots.

"The rate on the same class of freight from Seattle to New York via Panama, a distance of more than 6,000 nautical miles, is $10.00 a ton. On this freight the ship pays a toll of $1.20 a 'net vessel ton' at the canal.

"The rate from Seattle to Hong Kong, a distance of approximately 6,000 miles, is, on flour and wheat, $6.00 a ton.

"From Seattle to the United Kingdom or the Continent, a distance of 8,500 miles or more, the rate is about $7.00 a ton; and to Baltic ports, a distance of close to 10,000 miles, about $12.00 a ton—the ships always paying the toll at the canal.

"It will now be observed that over the comparatively short haul from Seattle to Anchorage the rate is 70 per cent higher than on the Seattle-New York route; 183 per cent higher than on the Seattle-Hong Kong route; 143 per cent higher than on the Seattle-Liverpool or Bremen route; and 42 per cent greater than on the Seattle-Baltic route.

"At the hearing before the United States Shipping Board a year ago the steamship companies contended, and successfully, that the ton-mile standard was the only equitable measure of the reasonableness of freight rates.

"Computation of the ton-mile rates on the above-mentioned routes will disclose that on the Seattle-New York route, after deducting the toll at the canal, the ton-mile rate is $0.00145; on the Seattle-Hong Kong route it is approximately $0.001; on the Seattle-Liverpool route, deducting the Panama Canal toll, the rate is slightly more than $0.0007; while on the Seattle-Anchorage route the ton-mile rate is, on carload lots, $0.0122. In other words, the ton-mile rate on the Alaska route is more than 840 per cent greater than on the New York route; more than 1,200 per cent greater than on the Oriental route; and more than 1,700 per cent greater than on the Liverpool or Bremen routes.

"By the water rates thus agreed upon by the government's Alaskan Engineering Commission and the steamship companies, the ocean end of the Alaska railroad is placed about 70 per cent farther from Seattle than the latter is from New York, and about three times as far from the nearest United States port as is Hong Kong. Anchorage is put about twice as far from Puget Sound as is New Zealand from the Golden Gate, and 42 per cent farther than the latter port is from the port of Riga.

Fair Dividend Record

"THIS is too much of a handicap for a territory of even the natural wealth of Alaska to overcome.

"It may well be admitted that there are features of a local character which render operations on the Alaska routes more expensive a ton-mile than on the other routes above mentioned. But does it cost, mile for mile, 8½ times as much to operate a steamer on the Seattle-Anchorage route as it costs on the Seattle-New York route, 12 times as much as on the Oriental route, or 17 times as much as on the Seattle-Liverpool route? No shipping man will believe that. Nor will the public.

"An examination of the records of the Alaska Steamship Company shows that when this corporation was organized the stockholders put into the enterprise $2,500,000 in the form of property. Nothing further has ever come from the stockholders into the treasury of the company. All increases in the holdings of the company have come from its earnings. The records of that corporation show that during the six years immediately preceding 1921 it had:

Paid in cash dividends	$1,900,000.00
Paid in stock dividends	1,500,000.00
On hand undivided profits	834,264.81
On hand depreciation reserve	1,347,744.83
On hand insurance reserve	222,205.35
Total	$5,804,214.99

"This is equal to 232.2 per cent on the investment or 38 2/3 per cent per annum for the years in question.

"But during all those years the company carried the copper ore of its holding company, the Kennecott Copper Corporation, for $3 a ton except during 1920 when it charged $4 a ton. A very low charge for carrying this ore, compared with other freight charges, would be $6 a ton. If this be taken as the measure it will be found that the steamship company earned for the holding corporation, in the form of indirect rebate, the additional sum of $2,191,575. This will raise the net earnings of the steamship company to 53.29 per cent per annum on the capital invested by the stockholders.

"The calculation of the reserve is, of course, based upon the book value of the accumulated property of the company, which at the end of 1920 was reported by the officers as $4,740,288.87, apart from the current working assets. At the hearing before the United States Shipping Board in 1918 the company introduced expert evidence to prove that the book value was more than $5,000,000 below the actual value of this property. At the hearing in 1921 the company made the same assertion, and the company's attorney, Frank Law, repeated it before the Senate Committee on Territories during November, 1921.

"It is perfectly fair to the company, therefore, to accept this statement as the present value of the company's accumulated assets. This means that at least $5,000,000 must be added to the amount reported as undivided profits—an increase of 200 per cent upon the capital invested. The net profit of the company is thus shown to have been 86.63 per cent per annum for the six years in question. That it does not cost from eight to seventeen times a ton-mile to operate on the Alaska routes as it does to operate on the other routes is, if not self-evident, obvious from this data taken from the company's own records.

"The remedy I suggest is for the Alaskan Railroad Commission to ask for bids for service on the Alaska routes, and then give an exclusive contract to the lowest and best bidder for a period long enough to justify a company in organizing a fleet of boats for the route. Academic objections may be raised, but the system suggested would reduce rates, improve the service, and be good business.

Contracts Net Big Returns

"AS TO the absence of competition on the Alaska routes, it is due to the fact that the present companies have what amounts to perpetual and exclusive contracts with the principal shippers along the coast. The Alaska Steamship Company is assured the tonnage of its holding company, the Kennecott Copper Corporation, and the latter's varied allied companies. The other company has placed its stock with many of the principal shippers who again each control many allied or associated shippers. A new carrier finds there is little to compete for except the transient trade, and it would be at a disadvantage in attempting to secure the latter because of inability to get support from the large shippers. One carrier who has an absolute guaranty of, say, 50 per cent of the traffic, who has to compete for only the other half, has the advantage of a 50 per cent handicap over one who has to compete for all his business. With equal facilities a new line could not under such conditions reasonably expect to secure more than half of the unpledged 50 per cent of the traffic, or 25 per cent of the whole. But a carrier that could secure only 25 per cent of the traffic if facilities were equal cannot for long maintain facilities equal to those of a carrier that holds 75 per cent of the traffic. Hence competition is out of the question It is probable that a guaranty of 30 per cent of the traffic to one carrier on a particular route will give that carrier an absolute monopoly, where the volume of the business is no larger than at present on the Alaska route.

"If, however, a new carrier can be assured a reasonably large tonnage by the government's Alaska railroad it can afford to enter into competition for the rest of the trade. In this fact is found the solution for the present Alaskan transportation problem.

"It seems reasonable to believe that the Department of the Interior, through its Alaskan Railroad Commission, has it in its power materially to reduce the rates on all the routes in Alaska."

"Is it not true that the joint traffic deal between the government's bureaucratic railroad builders and the Guggenheims increases rates far beyond the sum of the separate rates originally in force, and that this increase is handed over to the Guggenheims?"

Just Facts, Not Speculation

"I WILL answer that question," replied the attorney-general, "in the following words: The joint rates for less than carloads to the interior of Alaska are from 17 per cent to 50 per cent higher than on carloads. For instance, on grain in carload lots from Seattle to Nenana the rate is $40 a ton; in less than carload lots $51 a ton; on flour, $42 as against $51; on cement, $32 as against $51; on hay, $42 as against $59; on explosives, $84 as against $168. Generally the steamship companies do not draw any distinction between carloads and less than carloads, and when they do it is only $1 difference a ton. Nevertheless, under the joint through-routing agreement they are able to share in the enhanced rates on less than carload lots—an arrangement which at the expense of the public greatly augments the earnings of the steamship companies without any extra expense or service by the latter.

"To prevent misunderstanding a partial modification of this situation should be noted: The steamship companies draw a violent distinction between carloads and less than carloads on merchandise carried for the canneries."

(*Concluded on page 15*)

How Heavy Is the U. S. Mortgage to Europe?

Concluded from page 10

of goods total $1,000,000,000, and we get no gold in return, then Europe must owe us $1,000,000,000 and we are a creditor nation to that extent. There you have it simple enough. The bankers started this method of settling the debt question in 1915, when they gave out their report that we owed Europe only $3,250,000,000. They carefully avoided all mention of our temporary debt abroad which amounted to $1,300,000 000 in short-term notes, and finance bills. Secretary McAdoo found that $450,000,000 of this short debt came due in 1914. The debt was renewed, and finally canceled by our exports of merchandise, later on. But the optimistic financial writers overlooked these short debts and figured that the exports went to cancel our permanent pre-war debts; and the bankers didn't undeceive them.

The movement of goods and specie in 1919 was of itself enough to prove the dishonesty of the creditor nation claims. When the embargo on gold exports was lifted in June, the Treasury and Federal Reserve Board officials predicted that all danger of such a movement had passed and we could easily spare all the gold that was likely to go abroad. But events proved that they had a poor grasp of the situation. The outflow that followed was a trouble breeder from the start. The embargo was lifted on June 7, and in less than a week call money rose to 12 per cent, the highest rate since the formation of the money pool. June 15, stocks fell from 1 to 23 points on an advance in call money to 20 per cent and *the bank reserves showed a deficit* of $656,000 for the first time since the Federal Reserve System went into effect. Matters kept growing worse as gold went abroad and, on November 12 money rose to 30 per cent. "The effect" (says the *Sun*) "was one of the wildest days Wall Street has ever seen, with breaks in stocks running as high as 68½ points. The trouble was due to the calling of loans by the Reserve banks. These institutions were compelled to take this course by *the demand for gold for export to the Orient, in settlement of adverse trade balances*." Referring to the situation two months later, in 1920, the *Post* says, "The simple facts are that money is in strong demand, while the supply is relatively low. The country has *for a year past been exporting more gold than it has imported*, and it has been increasingly difficult to maintain bank reserves." In January and February, the money situation, according to the *Post*, was "the *worst in fifty years*."

What a situation for a great "creditor" nation!

One of the curious incidents of that period was that *while money was worth 15, 20 and 30 per cent in New York, it was described as being "dirt cheap" in London, the rates being as low as 2½ and 3 per cent.*

Now this situation is wholly inconsistent with the claim that the end of the war found us a great creditor nation. The boast of Treasury and Federal Reserve Board officials that we could easily spare all the gold that was likely to be exported was based on gross ignorance of the facts. The fact that the loss of only $300,000,000 out of a total gold stock of more than $3,000,000,000 could thus paralyze the money and stock markets fully justifies the belief that *we were a debtor rather than a creditor nation* at that time. *Foreign laborers and foreign bankers had credits enough here to command every dollar of gold, silver and paper currency in the banks and still leave us in debt.* We were doing business on borrowed money and masquerading as a money lender. This is the only rational explanation of the conditions which prevailed in 1919, exports of $300,000,000 in gold, the high money rates and panics in the face of a favorable trade balance of $4,000,000,000.

In view of all this talk about helping Europe to restore the gold standard it may be well to call attention to another fact: In January, 1919, the miners' appeal for a bonus to stimulate the production of gold was refused on the ground that "The principal problems arising out of *the fear that the gold standard throughout the world might not be maintained* have been largely removed by the cessation of hostilities." Secretary McAdoo approved the report and declared that "*the gold standard was now secure.*" His successor, Carter Glass and the Federal Reserve Board also approved the report. But the disastrous effects of the gold outflow *later in the same year* proved that these high authorities were wrong again.

And curiously enough *it was bankers who expressed the strongest doubts of the security of the gold standard.*

These doubts were most frequently heard around the beginning of 1920 when, as already noted, the money situation was described as being "the worst for that period in 50 years." In an article headed, "Reserve Officials Weeding Out Loans," in the *Sun* of January 17, reference is made to the huge expansion of bank loans and the urgent need of their curtailment. Then after stating that, "*We may have to drop the Gold Standard,*" the article quotes a prominent banker as saying that, "The whole situation can be summed up in two words—gold and psychology. Either the entire banking situation must be deflated, which is being accomplished in part by the effect of psychology, and in part by the clearing of the path toward a rise in discount rates, *or the gold standard must be abandoned.*" That there can be no doubt of the bottom cause of those fears for the gold standard is plainly shown by this item published in the same paper of about February 22. "Here and there throughout the Street, the steady flow of gold from this center *is viewed with general alarm.*" In this connection one banker declared that, "*'Stop the gold shipments' should be the stentorian demand in this country.*"

All apprehensions for the safety of the single standard were quieted by the reversal of the golden tide in 1920, and the bankers shrewdly avoided all open discussion of the matter by diverting public attention to the need of lending a portion of our surplus cash to promote the restoration of the gold standard throughout the world. As for our government officials at Washington they seem to be blissfully ignorant of the dangers that menaced the money market three years ago. No mention is made of it in their annual reports. They don't appear to know yet that at the very time they were proclaiming the security of the gold standard *our whole stock of the metal was mortgaged twice over to foreign bankers and foreign laborers.*

If Professor Bass is really desirous of spreading the truth and doing away with "evasion, concealment and pussy-footing" he should begin at Washington and after discussing "America and the Balance Sheet of Europe," he might turn his attention to America and the Balance Sheet of America.

Lakes of Peru, Long Cache of Inca Treasure

Concluded from page 7

and mountain caves, that Dr. Farabee and other explorers believe will be found the great bulk of the huge treasure which was thrown into the water, not only to prevent the Spaniards getting it, but also as part of regular religious ceremonies.

"Among the Quimbaya," says Dr. Farabee, "only those of high rank, the chiefs, priests and war leaders, were allowed to wear objects of gold. They wore cotton garments ornamented with gold plates. The doors of the palisades were hung with plates of gold which gleamed in the sun and clashed melodiously in the wind. The gold plates for the door of Sogamoso palace were valued at $80,000."

In Dr. Farabee's opinion it is possible to locate all the lakes that were considered sacred in ancient days, by means of Indian legends which have been handed down to the present day. There are many explorers familiar with some or all those legends who might lead the way to untold treasures, but few men of capital who care to risk their money in the attempt.

Many lakes are not shown on the most modern maps, and their names mean nothing save to the explorer and the native Indian. The sacred lake of Guatavita is known and has been the scene of some successful treasure hunting.

"The Colombian treasure in the museum," Dr. Farabee points out, "was unearthed in the department of Antioquia not far from the famous sacred lake of Guatavita, into which enormous quantities of precious objects were cast as offerings to the gods at the annual festival of the people.

"Priests with treasures of gold and emeralds proceeded on a raft to the center of the lake, burned incense and sacrificed the offerings. The high priest, who had been sprinkled with gold dust until he appeared a gilded man, the 'El Dorado' of the Spaniards, cast himself into the sacred waters bearing the treasures of all the people, deposited them at the bottom and returned to land. When the ruler of this region was compelled to submit to the Spanish conquerors he is said to have sacrificed to the lake two tons of gold and precious stones. The collection at the museum may well have been a temple accumulation which was hidden away to prevent its falling into the hands of Quesada, who began the conquest of Bogota in 1536."

In the later days of the Spanish treasure-hunting period various clumsy efforts were made to drain some of the lakes. The sacred lake referred to, however, is 150 miles long and drainage would be a prodigious feat of engineering there. In other sections it would be relatively a simple matter. One authority asserts that untold millions could be located at the cost of $25,000 for exploration work. In the larger lakes, which are very deep, the method would be to drag them, making frequent lifts. Since the gold thrown into the lakes to prevent the Spaniards getting it was nearly always thrown in one place, or in large quantities, as soon as one piece was discovered the rest would be easy.

Most of the gold used by the ancients came originally from the streams and was obtained by a system of placer mining. There are now two great American companies working in the Andes, but by far the majority of the streams which still yield heavily are unworked.

Where Are the Reptiles of the Everglades?

Concluded from page 8

the lake is alive with those who have realized and demonstrated the possibilities that lie there. The city, at the upper end of Lake Okeechobee, is the natural headquarters for the region. It is the shipping point of a great fishing industry that supplies the inland now with five to six million pounds of fish a year. Four large ranches on which 50,000 head of cattle and 4,000 sheep are grazing are located to the north and west.

The extent of the fishing industry is indeed amazing. During the season that closed May 1, more than 2,000 carloads of catfish were shipped. Kansas City, Missouri, is the market for this supply.

But it is of agriculture, fruit growing and cattle producing that the big minds are thinking—thinking and dreaming of the time when three million acres will be added to the producing area of the United States. And all of this territory within 60 hours' rail freight haul of New York.

And Miami no longer dreams of a harbor for ocean-going vessels, but actually has a harbor into which large freighters from New York, Baltimore and Havana are now steaming for cargoes of the products of the Everglades—a territory not a short time ago believed to be impossible of any other production than of Seminole Indians, alligators and snakes.

In Miami they call it "The Back Country"—a back country of more than two and one-half million acres; a back country larger than Porto Rico.

The Wahkeena Falls, on the Columbia River highway, are about 29 miles from Portland. They are 242 feet high and form a beautiful cascade.

Guggenheim Ship Interests Take Heavy Toll

Concluded from page 14

"You mean, do you, Mr. Attorney-General, that the fish trust has bluffed the carriers into according them a more favorable rate than the public can get, by threatening to put on its own boats otherwise?"

"I mean only this," answered the attorney-general, "that the rate on cannery supplies and products in carload lots varies from $5 to $7 a ton, and that the same things in less than carload lots have a rate varying from $13.50 to $15.50 a ton. The rate in less than carload lots is thus about 180 per cent higher than when shipped in carload lots. This means, of course, that the cannery people have a rate accorded them of about one-third of that exacted from the permanent residents of the Territory who, of course, do not buy such merchandise in carload lots."

"If the steamship companies can afford to carry the freight of the canneries for $5.50 a ton, I submit that the rates which the Government's Railroad Commission have agreed to award the steamship companies out of the joint through traffic are unreasonable. And I may add that when we take in due consideration the proportionate vast amount of freight which the commission has had to have transported both during the construction period and up to the present time, and we add to this the other very large quantities of freight consumed by the operations of the government in the coal fields, and we find that the government, nevertheless, has paid approximately three times as much a ton in freight as was paid by small canneries at Seldovia, Snug Harbor and other places on Cook Inlet, the impression left on the contemplative mind is decidedly disagreeable."

"Now, Mr. Attorney-General, these railroad people have been drawing fat salaries from the United States Treasury for many years, and nobody doubts they will maintain the Treasury connection for many years to come. What could have been their impelling motive to frame up such a deal as this?"

"I will not indulge in speculations touching motives," answered the attorney-general, "and must not be quoted in any way through which it might be inferred I had done so. You asked me for the facts in this case. I assume full responsibility for those facts, but no responsibility for inferences anybody may draw from them."

BRIEFLY TOLD

Trout from Scotland have been planted in the ice cold waters of the rivers around Mount Kenya, British East Africa, on the equator. The fish have grown to enormous size and thousands of trout ova are being placed in the hatcheries for planting in the many streams in that section which lies east of Lake Victoria Nyanza.

American banks are after the issue of bonds which Belgium is putting out for public works in the Congo. Fifteen or twenty millions of dollars are being raised for this purpose:

Three beautiful lakes, covering several acres, have been discovered in Southern Colorado in the land of sand dunes. A forest ranger of the San Isabel National Forest found buried cairns, stone bowls, carved pedestals and arrowheads in profusion on the lake shores, proving that at one time Indians inhabited the region. The lakes are situated among the sand dunes within an area of 80 miles of loose sand and are very difficult to approach.

Every pint of brandy a steady drinker takes shortens his life by 11 hours, and the average drink he consumes curtails his earthly sojourn by 25 minutes, according to statistics compiled by scientists of Denmark.

Rather than miss a football game at Coaldale, Pennsylvania, 10,000 persons remained in their seats and refused to desert the game to fight a fire which destroyed a house on the outskirts of the town. Appeals were made for firemen to respond, but not one moved. Coaldale tied Shenandoah 6 and 6.

Prineville, Oregon, owns a broad-gauge railway 19 miles long. It connects with the Oregon-Washington Railroad and Navigation Company and Oregon Trunk Railway at Prineville Junction. It is operated by a gasoline motor and is capable of hauling 10 carloads of cattle in regular standard stock cars. It serves the rich cattle country along Crooked River and the headwaters of the Deschutes and pays.

Twenty-five thousand dollars was paid for a first folio of Shakespeare in London recently. A rare first edition of Gray's "Elegy" brought $3,000.

The National Council of Catholic Women has announced its determination to fight the proposed legislation establishing complete legal equality between men and women, which is sponsored by the National Woman's party. Their opposition is based on the belief that it would endanger the present rights and privileges enjoyed by married women, the laws for the protection of women in industry, the wife's legal claim to support from her husband and that it threatens the stability of the home.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

A farmer in Switzerland withdrew his savings of a lifetime from the bank and hid it in the barrel of his shotgun. A rabbit stopped outside his door and the farmer grabbed his gun and fired. He got the rabbit but it cost him 2,000 Swiss francs, about $365, the amount he had stuffed into the gun and forgotten about.

A photograph, 96 feet long and 10 feet high, has been completed by the curator of the Chicago Academy of Sciences, in Lincoln Park, Chicago. It is one of four immense panorama photographs showing the Lake Michigan shore at Miller Beach, near Gary, Indiana, the famous Indiana sand dunes, the Grand Calumet River and the swamps stretching around the southern environs of Chicago. A picture of this size can be produced for less than $100 and tinting in transparent oils costs but a small amount additional, as compared with the thousands of dollars an oil painting would cost.

The modern racing airplane of today moves faster than did the cannon ball used in the Civil War. The cannon ball of that time averaged but 200 feet a second and the airplane does 360 feet a second.

New "dead lines" including both Wall Street and Maiden Lane, comprising the financial and jewelry centers, have been laid down for the protection of merchants and shoppers in New York City. Men with criminal records will be arrested on sight if found in the uptown area running two and a half miles from Ninth street to Fifty-ninth, and spreading out to include Fifth Avenue and Broadway, Lexington and Sixth avenues, thus taking in the department stores, hotel and theater district, regarded as the richest field for enterprising criminals.

The Roscoe Arbuckle films have been permanently scrapped. The Paramount management decided it would be unprofitable to release the films.

A pilotless army airplane has made successful flights of more than 90 miles with only an automatic control device steering it. Experiments show it to be possible to "shoot" bomb-laden planes, without pilots, at targets either on or off the ground with surprising accuracy.

Iron constitutes 4.2 per cent of the earth's crust.

A total of 1,007 newspapers were in operation in Canada in 1920. The language of publication is stated as English for 912 papers, French for 66 papers, German 5, and 24 newspapers representing 12 foreign languages.

A new gold strike has been made on Hills Barr Creek, in the Hope District, British Columbia, consisting of three quartz vein outcroppings in the creek, varying in width from four to fifteen feet and for more than a mile showing free gold with a little chalcopyrite. Samples run as high as $1,300 a ton, the average values for the three outcroppings run close to $25 a ton in gold.

A wealthy Japanese, owning 170 houses in one quarter of Tokyo, has, according to report, offered to sell these houses to his tenants on the installment plan, the renters to pay double their present rent for five years, at the end of which period they are to own their own homes.

Preparatory to its improvement, a survey of the Yangtze River is shortly to be undertaken. A hydraulic engineer to the Philippine Government, and formerly of the United States Reclamation Service, has been engaged by the Yangtze River Commission as survey engineer.

The vicar of St. Keverne, in Cornwall, England, found a vestment chest of Spanish workmanship, 300 or 400 years old, in a load of firewood delivered to him.

A new electric fly-killer consists of a panel frame connected with a transformer which is attached to a lighting circuit. Parallel rows of wire, carrying a current of 500 volts, cross this frame. The frame is placed where flies congregate and as they are attracted to the wires they are killed by the high voltage. Rat traps along the same lines have been perfected.

Approximately $1,000,000 has been spent by the United States Government during the last year in developing poisonous gases for military purposes.

Calling a Spade a Spade: The Bonus Demand

In Which a Clean-cut Analysis of the Facts as They Were Is Made

By ALEXANDER M'CAIN

THERE came a time when the Roman legions, as they returned from the wars, began to demand their share of the loot. At the same time Rome climbed on the sled and started pell-mell for the rocks below, where she arrived in due course and whence she has never returned. This action on the part of the legions, while not the basic cause of Rome's decline, was certainly corollary to it and an unmistakable sign of the times. Her ruin was due primarily to the fact that the race of people that made her great was gradually bred out and finally overwhelmed by inferior races. Similarly the race which has made America great is being crowded out of its own country and sooner or later, unless prompt and drastic measures are taken, will this great nation disintegrate into rotten fragments owned and ruled by hordes of worthless mongrels.

But it is not my purpose in this paper to discuss that big subject of race nor to touch upon the absurd theory that any good can come out of the melting pot. I shall try to confine my remarks to the subject of the soldier bonus, the clamor for which I firmly believe to be one of the worst signs of our time.

When the United States declared war in 1917 the land forces consisted of the regular army and the national guard, both considerably below war strength. Most of the men in uniform at the time were willing to sail for France at once—as a matter of patriotic duty or of professional and personal pride, or of both.

Recruiting posters flooded the country, but Mr. Bryan's millions were slow to spring. True, the noncombatant branches of the army rapidly filled their gaps; and when Congress raised the pay of a private from $15 to $30 a month even the cavalry patrol on the Mexican border reached maximum strength. Most of the men who came in with such a rush on this swell, however, were unable to say "horse" in English. Be it said to Mr. Bryan's credit that, as hard pressed for money as he always was, he did not wait for this raise in pay. The declaration of war caught him at Jacksonville, Florida, I think it was, and forthwith the headlines in the morning papers carried the great news, "Bryan Telegraphs the President, Volunteering as a Private." Now there was a recruiting office at that time in every city of any size in America, and had Mr. Bryan hied himself to the one down the street the sergeant on duty might have called the bluff.

But again, I must not get off the subject; though some day I hope to make a special case of this.

I do not know the official figures nor are they available to me, but I venture to state that the field artillery never reached war strength by voluntary enlistment, much less did the infantry—the "over-the-toppers." Yet many did volunteer to fight, to their everlasting honor, the glory of their country and the pride of their posterity.

The bald fact is, the bulk of the American Army was the result of round-ups personally conducted by draft boards.

The army fought well—bravely, nobly. On the whole, individually and collectively, the conduct of the men was such as the country may well be proud of for all time to come. But the reasons for these things are quite simple.

The Units That Fought

THE units that did the actual fighting were composed of men in whose blood the racial strain was predominantly Nordic. In fact, the Nordic race has ever produced the fighting man par excellence of the world. Let there be no mistake about that. Right there I have made a statement which I know to be unpopular in many quarters, but whether a statement be popular or unpopular should matter not at all to me so long as I know it to be true.

Another and most excellent reason why the American soldiers made such a splendid showing is that they were organized, trained and disciplined by officers and noncommissioned officers of the regular army. That is another statement that will elicit little or no applause, but just the same all ex-service men know that it is true. In refusing to interfere with Pershing and his staff in their conduct of the war, Mr. Wilson did a very, very great thing, one which no war president before him ever had the nerve to do. The results: political commanders were scarce indeed; the war was shortened at least a year; the saving in life and treasure was so immense that it cannot even be estimated; and there were practically no episodes in this war which wrought disgrace on the prestige of American arms such as were conspicuous in nearly all previous wars in which the country had been engaged—the stampede at First Bull Run, for example.

At any rate, for a dollar each a day and up, with board, Uncle Sam got together several million men to do with as he pleased. They ceased to be individuals and became mere pawns in the great practical and scientific game of war as played by the General Staff. They could not quit the job; quitting would be desertion. They could not strike; striking would be mutiny. Nor could they even threaten to strike for threatening would be insubordination. So with native good sense and sportsmanship they subjected themselves to discipline and played the game, with the result that Germany lay down about a year ahead of schedule.

All this time the boys were away from home and had but little fun and less money. Getting into the army and out and away from the home ties is in itself quite a hardship. There is none other quite like it, and to appreciate the quality of its hardness one has only to test it by personal experience. But, as a matter of fact, the majority of men in the service never reached France at all, and of those that did get across a very great many got no farther than port of debarkation or at farthest the S. O. S. It will be seen therefore that only a minority of the total in the service ever reached the front, though perhaps a majority of this minority did get through the real mud and on over the top. Ah, but they are the boys! As to that vast majority that never got anywhere near the front lines, it is only fair to say that it was not their fault that they did not, since they were simply pawns in the game and moved only as they were played. And it is just as fair to say that, not having been sent to the front, they really suffered no hardships more serious than homesickness and having to do as they were told every day instead of as they doggone pleased. On the contrary, they were made fairly comfortable and given wholesome and sufficient food. They were fêted, dined, danced with, cheered, photographed, thrown on every screen in the land and then cheered some more. They were Red-Cross-Nursed, Y-M-C-Aided and Socially-Welfared generally. They were given systematic drill and scientific exercise, and consequently became of more rugged health and stronger day by day. Also, and more to the point, they had instilled into them at every turn, patriotism, square dealing, self-respect and respect for authority. It is true that most of them left the army better men, more upstanding and self-reliant than when they were drawn into it by the scruff of their necks.

Bonus? They are not entitled to a cent. When we get right down to brass tacks they owe Uncle Sam, and in their hearts they know it. Congress knows it, too, but hasn't the cleanstrain sand in its craven craw to get up in meeting and say so.

What They Found on Return

BUT the men up front had a terrible time of it; often short on food and sleep; frequently cold and wet, tired and no place to rest. Any one who has never been cold and wet and tired and sleepy and hungry all at the same time is as yet unacquainted with simon pure hardship. And the mud and blood and brains and mud and mud and mud. Ask any old doughboy that lived through it. Then after all these things and after burying many of their comrades on the field of battle, the braves came back, were mustered out and sent home.

And what did they find? The country, their country for which they had suffered, gone mad. Luxury and extravagance rampant. Ham and eggs, a day's army pay; bread and butter extra. Ideals shattered, sex barriers breaking down, feminism and bootleg liquor. Stay-at-homes become wealthy by shrewdness, cleverness and rascality; the wealthy become millionaires. The profiteer abroad in the land and robbing with ease. They, the ex-soldiers, had been taken by the government and pushed willy-nilly into the army, a kind of service that entailed all the risks of life and limb and at a small and fixed rate of pay, whereas Samuel Gompers and his gang of cutthroat lieutenants had organized another kind of army which they maintained could not be pushed or pulled anywhere without its own consent, or, even with its consent obtained, then only at rates of pay hitherto undreamed of in the history of the world. While the soldiers were sleeping fitfully under wet blankets and hostile bombers these downtrodden sons of toil were snoring serenely under eiderdown and their own unpunctured shingles. While fighting men were waiting patiently in a damp billet for even a post card *from* home, these shirking men were waiting impatiently for a fat pay envelope *at* home. While men in the ranks of the army were smoking a breakfast cigaret before falling in behind a rolling barrage, these men in the ranks of labor were smoking an after-breakfast cigar over the family hearthstone, waiting to fall in behind the eight o'clock whistle. While many gallant boys were adjusting gas masks to their well-chiseled features, some of these lowbrows were waving their hats in the gas emitted from the treasonable platforms of radical meetinghouses. While heroes were laying down their lives for their country in a foreign land, these slackers were laying down the law to their country's government in their native land. While the army was striking the enemy for the sake of liberty and democracy, Organized Labor was striking for higher wages for the sake of its own bulging pocketbook.

When the boys returned from "over there" and saw the profiteer and union labor dividing the spoils between them and, at that, squabbling over the division, they became mighty mad. And who shall blame them? Had they but started in then and there to restrain these bandits and to set them an example in patriotism, the country would be well on the road to complete recovery by now. Instead, their anger turned to envy and their envy to greed.

The legions are demanding their share of the loot. It is sheer poppycock to call the bonus "adjusted compensation" or by any other high-sounding name that glides so trippingly off the tongues of sleek politicians. That kind of bunc is just as buncomby as a few years ago it was to refer to the draft as "selective service." Let's call a spade a spade.

The soldier bonus bill is nothing more nor less than a written proposal to legalize the wholesale looting of the United States Treasury.

If the veterans of the Great War succeed in getting this bill on the statute books they will have put through a deal that will make the lifetime operations of the Civil War veterans look like puerile pilferings. And would this raid be the last? Certainly not, if we may judge the future by the past. Banditry pays well, and once successfully begun is apt to become a habit. Witness profiteers, union labor and the James boys. Even the watchdog of the Treasury, Congress, has become a cringing cur hunting with the coyotes.

Nothing worth saving was ever saved without sacrifice. That truth, in peace no less than in war, is quite applicable to the case of this Republic. The strength and stability of any nation stand in direct ratio to that proportion of its citizenship that will stand to the rack, fodder or no fodder. Our young men, on Flanders Field, at St. Mihiel and in the Argonne, made noble and unselfish sacrifices. Are they now, in peace, quite unwilling to deny themselves these few miserable dollars? It appears so, to their own and their country's shame and to that of their children and their children's children. It is inconceivable to me and I simply cannot, in spite of all newspaper reports, believe that the American Legion is in favor of this thing. I wonder that their members should be willing to dim the luster of their war records with such peace-time selfishness.

But in 1917 I wondered that so many men waited to be drafted and I wondered that their sweethearts did not curl their crimson lips in scorn of them when they failed to volunteer. I am a pessimist; I have ceased to wonder and am afraid to hope. It is a fact that this weak thing we call a man has two main anchors buried way down deep and out to windward: faith in woman and faith in God. When she severs the cable that binds him to her in the bonds of inherent chivalry he, in sheer desperation, though unconsciously, is apt to cut himself loose from his last hope, the Rock of Ages. Unfortunately, the women have been clipping cables riotously for the past several years. (No, girls, my middle name is not Adam.)

Most of the arguments for the bonus and against it are based on money. Can the Treasury afford to pay it? That seems to be the issue. It is all wrong to discuss the subject from any such viewpoint. It is a matter of principle which goes far deeper than our purses. Our forefathers, the men who founded this Republic and made it what it is, bequeathed to us some things of much greater value than money and the opportunity and ability to make money, among which may be mentioned valor, chivalry and patriotism. Are our ex-service men now trying to convert their valor into cash? Is the chivalry of a soldier a thing of a past generation? And patriotism, that rarest of flowers, having its roots deep down in the rich soil of *home* and growing to fragrance and beauty only in the pure atmosphere of *unselfishness,* shall it be cut down and bartered away in the marts of graft and greed? It will be a sad, sad day for our country whenever these questions are answered in the affirmative.

Some Pertinent Questions

EVERY one who considers himself or herself a good American might, in the best interest of America, ponder the following questions:

1. What was the actual strength of the army on Armistice Day?
2. Of this number how many volunteered?
3. Of No. 2 how many applied for the infantry?
4. What was our total killed and wounded in action?
5. How many of No. 1 got any nearer the front lines, in actual combat, than division headquarters?
6. How many of each of the above classes had all four grandparents born in the United States? How many had two? Aye, one?
7. Subdivide each of the above classes and sub-classes into terms of race. And when I say race I do not mean nationality, as English, French, German, and so on. I mean *race,* as Nordic, Mediterranean, Alpine, Jew, Negro, and so on. (Where no individual is of a single race in its purity—very few persons are—place him in the column of that race which is dominant in him.)
8. How many now living of each of the subdivisions resulting from the above are agitating the bonus?

Answers to some of the foregoing questions are doubtless in the archives at Washington, but any attempt to dig them out and publish them would be howled down by the inferior racial groups that infest our land, their cowardly tools and ignorant dupes. Anyhow, no authority short of the Recording Angel could furnish all the figures, so what's the use? But set before us in black and white, such figures would be most illuminating on the general subject of what is the matter with the country that we are prone to call God's.

What a splendid thing it would be if every American Legion Post in the country should meet tonight and pass a resolution in effect as follows: "Congressmen, no one can expect your narrow and selfish minds to be able correctly to 'interpret the heart of America'; we don't want your dirty bribe. Mr. Wilson was right when he said we went into this war in the spirit of crusaders battling for the right."

Such a resolution would be heard round the world, even to every council chamber in Europe. And the heart of every good man and woman in America would once again swell large with honest and patriotic pride.

From the shore of the Potomac—The Lincoln Memorial, Washington Monument and Dome of the Capitol.

(C) Bailey & Benson, Washington, D. C.

Washington Contrasts: 1922

By ROLAND HUGANS

THE new Lincoln Memorial stands severely by itself, with its back to a bend in the Potomac, at the western end of a wide park. As you approach its marble pillars you note that workmen are still cleaning the basin which will later become a long lagoon stretching toward the Washington Monument. The Memorial itself is already complete, a great Doric temple on a green eminence, flanked with tall boxwood. The eye lifts with approval. At the top of the stone stairs you pause and turn, to gaze along one of the most gracious vistas in America. An umbrageous mall extends over two miles to the national Capitol. From a mound about three-quarters of a mile away the Washington Monument rears itself against the sky. These three white structures lie in a direct line, so that from where you stand the square shaft of the monument blots out the dome of the Capitol, leaving only two wings visible. This quality of unswerving straightness is always arresting—in Washington.

The interior of the Memorial appears to be almost bare. Its properties are restricted to essentials, so that the attention is sharply focused. A huge, square stone room; light streaming down from lofty panes of mottled color; and at the far side a colossal statue of Abraham Lincoln; that is all. The figure of the Great Emancipator sits in a mighty stone seat, mounted on a pedestal much higher than your head. One foot thrust a little forward, arms resting on the supports, hands half relaxed, eyes gazing straight ahead; the bearing suggests both dignity and ease, as is fitting. It was Emerson who remarked that the truly great "sit carelessly in their chairs." Here is sculpture which is adequate to its subject; and in this instance there can be no higher praise.

Two tall alcoves are marked off by rows of pillars, to the left and the right. On the south wall is chiseled, in large and legible letters, the Gettysburg Address, while opposite, on the north wall, is carved the Second Inaugural. The Address covers one entire stone panel and the Inaugural occupies three panels; for the commissioners have had the consummate good taste to reproduce these texts in full, subtracting not one syllable. How refreshing, how reassuring, come the familiar phrases!

—"It is rather for us to be here dedicated to the great task remaining before us."

—"That we here highly resolve that these dead shall not have died in vain."

—"That government of the people, by the people, for the people, shall not perish from the earth."

—"Both read the same Bible and pray to the same God, and each invokes His aid against the other."

—"The Almighty has His own purposes."

—"Fondly do we hope, fervently do we pray, that this mighty scourge of war may speedily pass away."

—"With malice toward none, with charity toward all, with firmness in the right as God gives us to see the right, let us strive on to finish the work we are in."

—"To do all which may achieve and cherish a just and lasting peace among ourselves and all mankind."

A Memorial That Measures Up

WHERE is there language more worthy to be chiseled on rock? You are struck once more with the lucidity, the justness, the balance, and the intellectual force of this man's utterance, and above all with the close-woven logic of his argument. At the core of every tremendous reputation lies some element of competence; and so it is with Lincoln.

The Memorial measures up. To say as does its inscription that herein "the memory of Abraham Lincoln is enshrined forever," is to make no hollow boast. Here undoubtedly the spirit of Lincoln will take up its abode. In the daytime, while streams of tourists pass in and out, you can see only eloquent stones. But at night, after all human presence has withdrawn, what echoes may go through that temple—when Lincoln walks! Does the great shade come to the marble portals and gaze wistfully, through the moonlight, in the direction of the executive mansion and the halls of Congress, with sad and puzzled eyes?

Going down the slope of steps your mind runs back, as to an anticlimax, to the simple and unimpressive ceremonies with which the Memorial was dedicated last May. Except for the high official position of two or three of the speakers, the exercises of dedication held no imposing features: a complete lack of eloquence, pomp and stateliness. These are dull days at the capital. The present régime follows consistently the precedent set by its cheap Inaugural, and is likely to be remembered, if for nothing else, as the Administration of Shabby Ceremonies. Perhaps some future administration, less obvious of spiritual values, will rededicate the Memorial with appropriate rites and honors.

Unmeaning? No, No, Mr. Wells!

BUT you press on, through sunshine and shade, to the Washington Monument. This high, unadorned tube of stone was undoubtedly meant by those who designed and erected it to symbolize the stark and lofty simplicity of the character of George Washington; yet few structures have received, on the score of architecture, more abuse. It seems especially to have irked H. G. Wells, who described it, in his book on "The Future in America," as "that stupendous unmeaning obelisk that dominates all Washington." This was in 1906. Seven years later, in 1913, Mr. Wells published a book entitled, "An Englishman Looks at the World." By this time the Washington Monument had sunk, in the opinion of Mr. Wells, to "an idiotic colossal obelisk." One hates to think of the contemptible aspect that this obelisk must have worn to the eye of Mr. Wells as late as the winter of 1921—1922, when he was in Washington to report the Conference on the Limitation of Armaments. But after all, is the fault chiefly with the Monument or with Mr. Wells? Here it stands, solidly enough, soaring 550 feet, and covering 3,000 square feet of ground at its base. Is it, then, so unmeaning? True, it is enriched by no statuary and embellished by no quotations. But an American may fill the gap from his memory, and reflect, as he stands dwarfed at the foot of this mammoth stone finger, on the character, the deeds and the words of the Father of his Country. That fountain-head of inspiration has not yet run dry:

"The preservation of the sacred fire of liberty, and the destiny of the republican model of government, are justly considered as deeply, perhaps finally, staked on the experiment intrusted to the hands of the American people."

Is there not something here that still may be taken to heart?

Or again:

"In proportion as the structure of a government gives force to public opinion, it is essential that public opinion be enlightened."

Today thick books are being written to elucidate that point.

Or once more:

"Let us raise a standard to which the wise and honest can repair."

Who in all these decades has given America a better motto? Let us raise a standard to which the wise and honest can repair! Let us build a citadel around which the wisdom and honor of mankind can rally! If this be the significance of this obelisk, it looms none too colossal.

From the base of the Monument it is but a few steps across the ellipse to the White House. You skirt the iron fence that surrounds the executive grounds until you find an open gate, and enter that cool inclosure. You are fortunate, and see the President himself. He emerges from the recesses of the executive mansion to greet various groups of visitors. Now he is posing for his picture in the center of a bevy of commercial travelers. Now he is reviewing the parade of a fraternal order, bowing again and again, and making signs with his hands. And now he is accepting an invitation to become an honorary member of the tribe of Flathead Indians in Montana. To this easy-going cordiality there seems to be no limit. You reflect, however, that the wives and children of political prioners received an exceedingly cool reception at the White House, and you cannot imagine Gorky at the head of a group of Russian intellectuals being greeted by Mr. Harding with the same warmth as he displayed to the Flatheads.

With a glance at the State, War and Navy Building, and at the Treasury, you resume your walk. You pass the Department of Agriculture and the Smithsonian Institution. You tramp east along a narrowing mall, keeping warily to the paths lest you be warned off the grass, for these public lawns are to be traversed only with thine eye. Across the Botanical Gardens, past the statue of General Grant, and up an easy incline, and lo, you are at the Capitol itself, the abode of the Congress, and the heart of the Federal political scheme.

The Capitol building fills the vision. For so huge a structure it is well proportioned; and although much fun might be poked at its Corinthian porticos and its allegorical decorations, the total effect is one of massive symmetry. The central portion is nearly a hundred years old; while the wings and dome were added a half century ago. Altogether it cost $20,000,000, which is a great deal of money, nearly one-half, in fact, of the cost of one modern battleship. Entering at the middle doors you encounter first of all the dim canvases of the rotunda, and next the grotesque denizens of Statuary Hall. But these will not detain you long. In this edifice you seek to observe the living government in operation.

Politicians and Ideals

YOU have been prepared, no doubt, for the spectacle before you; your expectations are not too high. Only schoolboys from distant states think to find in the Congress of today something of the accent and gesture of Webster, Clay and Calhoun. From the gallery of the Senate chamber you look down on a listless debate, carried on by the remnants of a deliberative body whose real business is apparently elsewhere.

You wander over to the House wing. There things go at a sprightlier pace. Debate is limited, and the speakers try to cram more words into their allotted time.

You seek the fresh air again. A welcome breeze is springing up. H. G. Wells, in one of his gloomy animadversions on our national capital, says that "It seems an ideal nest for the tariff manipulator, a fester-

Davis Tells Them!

"I AM NOT at all impressed by the widespread agitation against the immigration law."

The words are those of the Secretary of Labor, James J. Davis. Mr. Davis is not impressed because he knows the character of the agitation and whence it originates. He knows, too, that in the final analysis the manufacturers and large employers of labor who are advocating repeal of the three per cent legislation are having the wool pulled over *their* eyes in the same fashion it has been many times before.

The summing up of the situation by Mr. Davis is well worth widespread publication. "There is an impression," he says, "that the so-called three per cent law has operated arbitrarily to limit our immigration from all European countries. Nothing could be further from the truth.

"At any time since the law has been in effect, workmen for our industries of the racial strains which have made America great, which have up to the last two decades made up the bulk of our immigration, could have been admitted by the thousands. They did not seek admission. They are not coming to America. In the last fiscal year only, less than one-half of the quotas that could be admitted under the law have come from England, Ireland, Scotland and Wales, from Norway, Sweden, Denmark, from Holland, from Germany: Denmark, 57.6; United Kingdom, 55.2; Norway, 48.7; Sweden, 43.8; Germany, 28."

The publications that are spreading the propaganda designed to break down the present immigration restrictions will, immediately upon reading Mr. Davis' statement, decry it as that of an "anti." An "anti" these days is a person who cares enough for this country and its institutions and ideals to want to see them perpetuated, not swept away and engulfed by the alien tide that has taken over New York and has reached out into every great city of the country.

The keenness of Mr. Davis in recognizing the problem for what it is and his courage in coming out that the truth may be known are a splendid commentary on the caliber of the Secretary of Labor.

Engineering and Honesty

THE newspapers have carried the story of an engineering student who found that he had been credited too highly on his examination papers. He returned the papers to his professor, called attention to the error, and received the lower marking which his work deserved.

To draw a moral of honesty from such an instance would be to lose sight of several things. Engineering *is* honesty. This student may or may not have acted on a consciously ethical and moral impulse. He may or may not have returned the papers because his stock of religious inhibitions were wholly against his availing himself of an undeserved credit. These matters could only be decided after conference with the student himself. But, in any case, it is precisely what he should have done *as an engineering student*. Engineering *is* honesty. It is the science of the truth of materials and their use. As an engineer this young man would know better than to place a 2,000-pound strain on a 500-pound strength. It is just as fatal to the general concerns of society for anyone to place 100 per cent confidence in what is 50 per cent deception. A whole community was plunged into ruin the other day, years of its time and labor and incalculable values of a more delicate kind were destroyed, because the people placed 100 per cent dependence upon a banker who was only 25 per cent dependable. A course in engineering would have been good for that banker—and maybe for that whole community. All of us ought to know on what we are resting the life of the community and the nation, all of us ought to know whether the institutions on which we depend are strong enough to carry the load.

With more of the engineering type of mind in public affairs there would be more general safety. Engineering is edifying—that's its business. It enters into all building, it is the technique, in one form or another, of The Race of Builders. If our politicians were tinctured a little with the a b c of engineering we should not only have honesty (that goes without saying) but efficiency, the kind of efficiency that knows that national life cannot be built on a foundation of wind-bags, and that a national monetary system cannot be made the corner stone of private concessions.

This country wants engineering types, not only in every field of industry but in finance and legislation and in public health and in all our economic and educational affairs. Because the engineering type goes to the foundation and builds up honestly, knowing that only honest building will stand.

Lawmakers Break the Law

"*THE SEARCHLIGHT*," one of the few American magazines that tell the truth, or that know enough of the truth to make it worth telling, has an article which includes the following statements:

"There is no unit of American life today where studied disregard of the Volstead Act is more in evidence than among the lawmakers on Capitol Hill, unless it be among the administrative officers charged with the solemn duty of enforcing the laws. It is a matter of common knowledge that there are many places in the Capitol building today where whisky, wines and even beer can be obtained in violation of the law. Senators, Congressmen and their clerks are serving intoxicants to callers . . . . Senators and Congressmen who voted for the Volstead Act are the worst offenders . . . . In the closing hours of the Senate at the recent session, there were evidences of drink on every hand . . . . A group of newspapermen witnessed an orgy through a window of a committee room that seemed incredible to the average American citizen. . . ."

And yet, because we are so jealous of the good name of what remains of the remnants of our old-time people's government, we count it a duty to withhold the facts. Suppose the duty to speak becomes clear! Could those responsible to the people survive for one moment the avalanche of disgust and outraged confidence that would follow?

The United States has gone "dry." It is time for Washington, D. C., to follow suit.

This Must Not Be

A PIECE of legislation known as the Bursum bill and supported by the Administration, having passed the Senate, will, if it becomes law, wipe out the 8,000 Pueblo Indians of New Mexico. No more sinister betrayal of the rights and privileges guaranteed to the helpless charges of the United States Government ever has been attempted in the long record of evils perpetrated upon our wards.

The Bursum bill, introduced by a Senator from New Mexico, would validate the claims of all squatters now illegally possessing lands of the Pueblos taken and held by the squatters despite all attempts of the Pueblos to remove them. One person responsible for the authorship of the measure is an attorney who represents claimants to the Indian lands; the co-author is a Special United States Attorney, a person who in the past has said: "Our local courts have yet to show, in my judgment, where an Indian has ever received a square deal."

The Bursum bill makes it impossible for the Indian to receive any kind of a deal, inasmuch as the legislation provides that the United States court is ordered to accept present claims of holdings as "secondary evidence" in proof of title.

THE DEARBORN INDEPENDENT in the past has published articles having to do with the plight of the Blackfeet Indians of Montana who have been the helpless victims of the Indian Bureau for some years. Since the exposé of conditions in the Blackfeet reservation, first published in THE DEARBORN INDEPENDENT, other publications have taken up the battle, and there is reason to believe that conditions may become somewhat ameliorated for these far-western dupes of our bureaucracy. Now comes this new outrage, sponsored by the Administration, one of the members of the Cabinet, a plum-holding Federal officer, and a Senator from New Mexico *whose job, of course, is dependent on votes. The Indians can't vote.*

Financed His Own Farm

THE *Southland Farmer* relates how by co-operation a farmer was able to make needed improvements to his buildings, fence his land, and finance his coming crop of magnolia figs from a position of deflation to the bare land.

Texas laws do not permit an owner to mortgage a homestead, thus the farm had remained clear of liens. The banker to whom the farmer applied for a loan was satisfied with the risk, and knew a way in which the land could be made available as security. It was a trick to evade the law forbidding the validation of a mortgage, and this was the way of it: Mechanic and labor liens against the property were legally permissible, so a contractor was secured to take the job of completing the house, erecting a barn and necessary sheds, and building the fence. The contractor received liens for work and material, the liens being transferred to the bank to be drawn against as the work proceeded.

The farmer's table had been provided for the winter, and he needed very little cash for expense during the idle season; but where was he to get the amount needed to finance his crop?

The banker had thought of that, too. And here is where banking brains proved to be creative. This banker insisted that the contractor employ the farmer on his own job, rough carpentering, driving his team in hauling material, excavating, and on whatever work the farmer was competent to do.

When the contract had been carried out, Mr. Farmer had a much better property than before, more than cash enough to finance his crop, and was able to discharge the liens from the season's produce.

The banker had gained interest on more money than the farmer would ordinarily have borrowed; furthermore this interest was obtained upon security which the banker could not have used in obtaining funds from the Federal Land Bank; and, besides all this, the farm had practically improved itself.

Of course, the same evasion of the mortgage law might be taken advantage of to rob the owner of a homestead, but the banker who appears in this narrative was a true servant of his community, following a policy that dictated helpful treatment of patrons. If this were more generally the case there would be much less reason for bitterness when farmers are out of money.

The Jews a Nation

THE New York *Jewish Daily News* of November 20, offers the following editorial:

"The International Court of Justice which is seated at The Hague, the capital of Holland, is now in the process of reorganization. It is proposed to make such changes as will enable the United States to appoint a member of the court. The court consists of 15 members, 11 judges and four deputy judges. This number may be increased to a total of 15 judges and six deputy judges. We are told that the 11 judges represent every phase of jurisprudence and many nationalities. Among the different forms of civilization and systems of law represented are: English, American, French, Iberian, Germanic, Dutch, Mohammedan, Japanese and Chinese. What about the Jewish? Jews as Jews should have a member of the court and the Jewish system of law should have its spokesman. There must be full equalization of the Jew before the world will revise its attitude toward the Jewish people. Moreover, the basic Jewish law has had important bearing upon the codes of law of other peoples."

Yet, when it comes to the immigration law, the Jews say they are "English, American, French, Iberian, Germanic, Dutch," and even "Japanese and Chinese," and not Jews at all.

Not the Only Case

LITIGATION in the Kentucky Federal court between a non-member of the Federal Reserve System and the regional bank at Cleveland, in which the latter is charged with malicious persecution, is not the only case of the kind. In the United States District Court at Portland, Oregon, the Brookings State Bank has filed suit for $30,000 actual and $100,000 exemplary damages against the San Francisco Reserve bank because of similar treatment.

The Brookings bank alleges that persecution arose in its refusal to clear the Federal bank's collections at par, insisting on its usual fee of one-tenth of one per cent, sufficient to cover bookkeeping and remittance expense. The Chicago *Banker,* which reports the case, gives no other details, but in another item speaks of the practice in Chicago of charging a fee of five cents for each check handled in banks in that city.

Mr. Ford's Page

IT WOULD be amusing, if it were not so tragic, to witness the disturbance of the politicians. They are frankly at a loss to understand what is occurring in their chosen field. These men, who have prided themselves in knowing human motives so thoroughly that they never had any doubt as to what string to pull, are confessing that they are now completely at sea, that the people have them not only guessing but gasping for air. The old explanations do not explain; the old alibis do not give any comfort. The politicians are up against a situation which does not lend itself to solution by their methods—for they are up against the end of their world.

For one thing, politics does not bulk as large as it once did. Politics does not matter so much. Politics has come to be a scramble for seats in government offices—an auction of jobs. And not very desirable jobs at that. Politics has become a side street in national affairs. Sometimes, to call attention to itself, politics meddles with the real affairs of the nation; but as for really affecting the life of the nation, that is a power that politics no longer has. There was once a time when the country stopped to listen when a statesman said anything. Nowadays not even the statesman's own colleagues listen. Visit the Senate some day and it will be clear that the Senate does not believe that what is said in the Senate is worth listening to. Now, there is a reason for that. And the fact itself means something.

For another thing, the honor has largely gone out of political position. There was a time when the position shed luster on the man. No matter who the occupant of the office might be, he became of note, he was thought worthy of respect merely because he held the office. That is no longer the case. With not a single exception, from the highest to the lowest, our seats of power have been so badly occupied for so long a time that they have ceased to mean what once they meant to the American people. The President is no longer the President—he is a citizen who ably or weakly occupies the Presidency. It is now recognized by high and low, by the whole mass of the people, that the Presidency itself is unable to confer ability upon the man who occupies it. If a man has nothing in him, the office cannot put something in him. If a man has no power in himself, all the power which the office may confer will not serve to cover his own weakness. Nothing so discovers a man's weakness as to put into his hands power which he is too timid or too weak to use. We have reached a time in the world's affairs when even the King is not a king unless he is kingly without his crown, and strong without his scepter.

DO NOT be alarmed if from this time forward the mental atmosphere of the country becomes more tense. There is a great heading up of contending forces. Some groups which believe they are fighting against each other are not fighting against each other but against the common enemy of both. The politicians think it is political, the religious leaders think it is religious, the economists think it is economic; it is none of these, and yet it is all of them—it is evil in every stronghold making the fight of its life. The fight will be bitter; evil is never a nice fighter. False friends will be unmasked and the plain people will suffer great confusion of mind. Let them give their allegiance to what appeals to their souls as RIGHT; for it is easier to think wrongly than to feel wrongly. Their sense of Right is the people's best defense.

But there has always been this to console the country: in every legislative body there has always been, and in the higher reaches of government position there has sometimes been, an individual who shone like a lamp, to show what the office could be made when manned by a man. These have been beacons of hope, perhaps, pointing to the time when offices again would be wholly manned by men.

Now, along with these changes have come others. The fact that legislators are not representative does not shut down the legislative machinery. The form of popular government continues and the power to make laws is not decreased. So that with the people's loss of interest in the actual machinery of government, and their total loss of confidence in the superior wisdom of government, and what is more serious still, their steadily disappearing trust in the good intentions of government, there has stepped into control the selfish powers which can still use the government to complete the control of what has been called "the invisible government" of those who regard the United States as a huge money-making mill and nothing else. It is alarming to consider how much of the power of the people's government is absorbed in legalizing practices and privileges which are not in the people's interest. The large grist of laws has been referred to by all observers of our national welfare as one of the most conspicuous signs. Laws by the hundreds and thousands are turned out of the mill, and other hundreds and thousands are waiting their turn, and in spite of them all the condition of the people does not greatly improve. Indeed, it is only three months ago that the business men of the country had to demand, peremptorily, the repeal of a certain law that was actually tying the country into a double knot for the benefit of the coal bootleggers.

That brings to mind the other tendency which has appeared in our government, the habit of making rules which are not even laws, but which have to be obeyed as if they were laws. We have all sorts of boards and committees and commissions and bureaus ruling us and telling us what we must do, until Prussia in her palmiest days appears as a free country in comparison. Only our rules are not of the "verboten" kind, they are of the regimenting kind. There are any number of things that we must do if we are to walk in harmony with what a few busy job-holders in Washington think we ought to do. Large sums of the public money are expended on these extra-governmental activities, while bona-fide departments that render genuine service to the nation are neglected. The story of the treatment which the United States Government accords the scientific men in its service would almost make a companion story to the stupid cruelties and injustices which have marked the government's control of Indian affairs. Bureaus, as catch-basins for all the ragtag and bobtail ideas which the rulers of the Government wish to play with, are nearing the end of their already too long lease of life.

Then, there is another development that should not go unnoticed, and that is the tendency of the "invisible government" to take its best men out of the elective field and put them into the appointive offices. Does it occur to the average citizen that the representative, for whom he is permitted to vote, does not have one-thousandth part of the power that an appointee of the head of the Shipping Board has? In the practical business of the country, the people's vote has next to nothing to say. It can accomplish nothing. Can the people's vote have anything to do with the distribution of money to the farmers? Not a bit. Yet this is being done, and certain men for whom the public would never vote are making the distribution, and they are doing so according to a plan of their own, a plan which has its objectives and offshoots of which the public hasn't the slightest inkling. Let there be no misunderstanding: the people have not even a distant voice in the matters which most vitally concern them. Even Congress has no voice. Congress is not in control. There is a very perfect mass of machinery to prevent Congress gaining control. It is a disturbing situation when you see it clearly.

Of course, the people do not see this nor do they understand it, but they sense it. That seems to be the ultimate protective faculty of the people, their power to *sense* things. They feel the drift, even though they cannot explain it. The soul of the people becomes extremely sensitive at times, and it is entirely this soul of the people that the politicians never knew. There is a heading up, a focusing, a culmination of two forces, and presently they will be in collision. The people will endure, and the false edifices built by misuse of their delegated power will fall. Hatred and cunning and the extreme efforts of evil propaganda are now being put forth; the enemy is being revealed; all disguises are being cast off; the lines are being tightly drawn; both camps will be large and the fighting will be desperate; but the camp of the people will endure.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Lifting Grapevine to Reveal Bootlegger

Volstead Act Voted Into Law of California, Crushes Violations

By ROBERT MORGAN

Behind this beautiful screen the liquor interests of California sought to defeat the Wright Act, which makes the Volstead Act a part of the law of the state. More than $300,000 was spent in the campaign against the Wright Act.

Stills and liquors found by operatives of the California State Law Enforcement League in a Japanese house.

BY A majority of considerably more than either the prohibition forces or the liquor interests had believed possible, the people of California at the general election of November 7 brushed aside the grapevine defenses of the distillers, the brewers and the bootleggers, and voted the Volstead Act into the law of the state. This was done by adopting the Wright Prohibition Enforcement Act, passed by the last session of the state legislature, and carried to the electorate on a referendum by the liquor interests. Two years ago a much stronger measure, the Harris Act, which made California bone-dry, regardless of Federal laws, was defeated by a majority of approximately 65,000 at the general election.

Thus, this year's vote of the people—422,085 for the Wright Act and 390,122 against it—shows an extremely important change of opinion in California, the leading wine-producing state of the Union, in regard not only to prohibition, but to prohibition enforcement. Though out of a state registration of 1,532,384, only about 813,000 actually voted, there are evidences abundant enough to show that practically all the wet vote went to the polls, while the great majority of those who did not vote, would have voted dry—that is to say, for prohibition enforcement—had they cast their ballots.

The Wright Act, in brief, makes the Volstead Act a part of the laws of California, and if the Federal statute be repealed, amended or altered in any form, the Wright Act also is simultaneously and automatically repealed, amended or altered. That is to say, California, under the Wright Act, remains dry only so long, and in the same degree, as the nation remains dry. The state law just adopted makes not the slightest difference in prohibition in California, but it does make a tremendous difference in the enforcement of prohibition. It directly commands some 400 state, county, city and township courts to bring to trial and sentence violators of the Federal prohibition law, in addition to the three Federal courts now so employed. It makes imperative the enforcement of the prohibition law on nearly 4,000 sheriffs, deputy sheriffs, constables and city and town policemen, in addition to the 40 Federal prohibition agents now engaged in this work. Every peace officer in California will be a prohibition-enforcement officer as soon as Frank C. Jordan, secretary of state, signs the Wright Act, making it the law, which will be about the third week in December. At the same time, every court becomes a court of authority and jurisdiction to try violators of the Federal prohibition law. And the picture is very, very depressing to the bootlegger, who, under the guise of the wine industry, behind the screen of the grape vineyards, and in spite of the best efforts of a handful of Federal agents, has flourished like the wineries of 10 years ago throughout this state.

There are, in the Federal courts of San Francisco alone, approximately 1,500 cases charging violation of the Volstead Act. It is estimated that these cases, if tried at the rate of one a day—almost an impossibility, since all are entitled to jury trials, if demanded—would require five years, with the courts sitting every working day. Meanwhile, other similar cases are piling up at the rate of 10 to 25 a day. But, under the Wright Act, these cases can be transferred to the state, county, city and township courts, and new cases brought directly to these courts, so that the violators of the prohibition law may be brought to trial as rapidly as arrested.

Therein lies the sting in the Wright Act; therein is concealed the reason that the liquor interests of California, disguised as grape growers, expended more than $325,000, circularized nearly 900,000 voters, and worked day and night for more than a year, to defeat the Wright Act. They wanted to protect the bootlegger, not the grape industry, and to save the maker of moonshine rather than the legitimate wine producer. To the women of California goes the credit for the defeat of the liquor interests and the passage of the Wright Act, just as to the women of the United States, banded together in the Woman's Christian Temperance Union, goes the ultimate credit for the 50-year campaign of education which resulted in national prohibition.

The cleverest bootleg joint in San Francisco, consisting of two separate apartments, upstairs and down, originally not connected in any way. The person coming to call at the upper flat, would find the door locked, and, to all appearances, the place unoccupied. Going to the lower flat, the detectives were allowed to search the house, but, naturally, found nothing, the blind door into the second flat being well concealed. More than two months were required to solve the problem of this distillery.

Due to the inactivity of the California branch of the Anti-Saloon League, which was in charge of the campaign for the Harris Act in 1920, that act was defeated by a majority of about 65,000. The same inactivity characterized the campaign for the Wright Act, this year, except for some personal work done by various members of the Woman's Christian Temperance Union in San Francisco and Los Angeles, until Mrs. Kathleen Norris, the novelist, realizing that the Wright Act, if defeated, could not be brought before the people for at least two more years, organized in San Francisco the Committee of One Thousand, all women. This committee, in turn, organized a Committee of Five Thousand, also women. These women worked day and night to counteract the propaganda of the liquor interests, carried the arguments for prohibition enforcement into thousands of homes, interested thousands of other women in the battle, and in the months of September and October, when bets of two to one were being made against the passage of the Wright Act, turned the tide in its favor and made California the forty-seventh state to adopt provisions for the enforcement of the Volstead Act.

The Wright Act, of course, is not to be allowed to become law without a legal fight on the part of the liquor interests. Money has been raised and plans laid for test cases, to be carried to the supreme court of the United States, if necessary, to defeat it, since, if enforced, and sustained by the higher courts, it spells the doom of the bootlegger, the bootlegging winemaker, the importer of liquor, and the most dangerous of all, the bootlegging Jew, who, as a rabbi, sells "sacramental" wine to his "congregation." It is estimated that there are 15,000 bootleggers in California, of whom more than 5,000 are located in San Francisco, Oakland and other cities and towns around San Francisco Bay. Indeed, the operations of the bootleg liquor interests in California, both to perpetuate their nefarious industry, and to thwart the enforcement of prohibition through defeat of the Wright Act, is of even greater interest to the people of the United States than the purely local contest to put the Volstead Act into the laws of California.

This fight by the liquor interests was made, without exception, behind the innocent grapevine, and appeared in the open as a plea, persistent not only in California, but in every state in the Union, that, because of prohibition, the grape industry is dying a slow but certain death. As a matter of fact, however, supported by figures which the California liquor interests cannot evade, the grape industry has just had the most prosperous year of its history. It is true that the shortage of freight cars and refrigerator cars has brought large loss to the grape grower, but that has nothing to do with the fact that he sold his grapes—even though, owing to rail conditions, he was unable to deliver them—at $75 to $135 a ton, whereas, before Mr. Volstead got into action, this same grower was overjoyed with $15 a ton, and usually accepted $10 or $12 as a fair price. When he received $20 a ton for his grapes in the old days, the grape grower became wealthy overnight; today, he will not halt his chauffeur-driven motor to speak to the buyer who attempts to flag him with less than $100 a ton for his grapes and $75 for the culls. That is the true condition of the grape industry today; that is the reason that the honest grape grower is a prohibitionist, and that, too, as will be seen later, is the reason that the "grape growers' associations" now fighting prohibition in California are composed, not of grape growers and vineyardists, but former distillers, former liquor salesmen, and former saloon keepers.

That, too, is the reason that the coat of arms of the California bootlegger is a bunch of grapes ripening on the vine, symbol of an honest industry, which in itself holds no hatred for prohibitionists and no opposition to prohibition, since it is today more prosperous than it ever has been, even though the grape plantings for the past year have increased the area devoted to vineyards *by more than 60 per cent*—all and solely because of prohibition. The power of these liquor interests in San Francisco may be judged, in a degree, by the fact that, on the same day on which California voted prohibition into its statutes, the electorate of San Francisco voted a mandate to the board of supervisors instructing that body to memorialize Congress to permit the return of wine and beer!

If wine and beer should be "returned," as these disguised liquor interests demand, what would happen to the grape grower? He would go back to pre-prohibition prices for his grapes; that is, the winery operator would pay him from $10 to $20 a ton for grapes for which the vineyardist is now receiving from $75 to

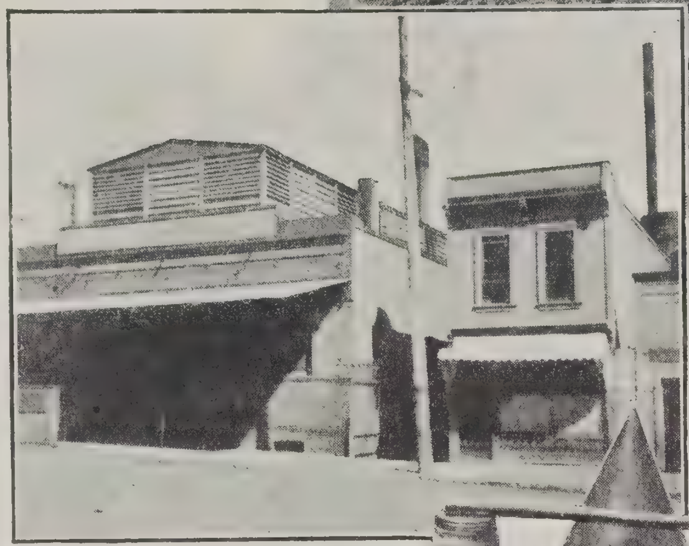
$135 a ton. And yet there are hundreds of thousands of persons in California who have been so "educated" by the liquor interests that they believe the grape growers are back of this movement for the return of wine and beer. There is, of course, in the liquor ranks, an occasional bootlegging wine maker, and, more rarely, now and then a grape grower who is supplying the bootlegging winery man with grapes, but these are not one to the thousand of grape growers in California. The latter find three markets for their grapes: First, to the person who makes his own wine for his own use, as he is allowed to do under the law; second, to the winery which makes legitimate wines for sacramental uses, and grapejuice; and, third, for raisins. For all these purposes, the vineyardists are receiving higher prices, with far wider markets, than ever before. They are not, and never have been, aiding the distiller and former saloon keeper in their support of the bootlegger.

The better to carry on this fight against prohibition, and also to bring together, in so far as possible, the legitimate grape-growing interests of the state in an apparent effort to advance the viticultural industry and its well-being, the leaders of the former legitimate liquor industry and the present illegal liquor industry, organized the California Grape Protective Association. Then, within this association, was created the heart and brains of the anti-prohibition movement in California, under the name of the "Vineyard Products Protective Association," incorporated, according to its own published announcement, "to work for the repeal of the Eighteenth Amendment; to urge an amendment to the National Prohibition Act which will permit the manufacture of light wines for beverage purposes, and the sale and delivery thereof direct to the homes; and to oppose intolerance."

As has been explained, if this Vineyard Products Protective Association should accomplish the objectives it outlines for itself, it would immediately and automatically reduce the price of grapes to the former basis of the legal wine days. The result of this is that the grape grower is not now, never has been, and never will be, joining or supporting such an organization, pledged to obtain a result which means reduction in the price of his product. This fact in itself lays plain to the world the further fact that the real supporters of the fight on prohibition in California —which is by no means ended by the passage of the Wright Act—are the bootlegging wine makers, the bootlegging rabbis, the former distillers, the former saloon keepers, and the two classes of whisky bootleggers, those who make their own so-called whisky in hidden stills, and those who import it from Canada or Mexico.

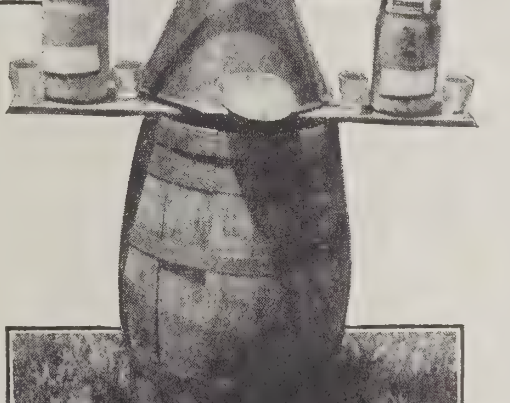
These members of the lawless element are in great majority foreigners, of late not infrequently Japanese, but never possessed of Anglo-Saxon names, unless they have adopted them. It is of interest to note that S. Federspiel, head of the Federspiel Wine Company, of San Francisco, is president of this Vineyard Products Protective Association, which is seeking to destroy a section of the Constitution of the United States. The headquarters of the association — not in the same building with the Grape Protective Association—is in an office which bears the name of Edgar Sheehan, in the Hobart Building, 582 Market Street, San Francisco. On the board of directors appear the names of J. A. Barlotti, George Dondero and Maurice Selig. Theodore Gier, millionaire wine man of Oakland, just across the bay from San Francisco, who was a member of the executive committee of the Grape Growers' Association, a delegate to the meeting which resulted in the formation of the Grape Protective Association, and also to the later organization of the Vineyard Products Protective Association, is at this writing under arrest like a common bootlegger, on charges of conspiracy to violate the national prohibition law. Government investigators found a shortage of many thousands of gallons of wine in his establishments and Gier's wines and wineries were seized. Gier so far confessed his part that his attorney made an offer on his behalf to pay all the taxes and the civil penalties if the accused be relieved of the criminal charges.

The Central Vineyard Company, of San Francisco, and the Holy Rosikrucian Church, of the same city, when raided by Federal prohibition enforcement agents, yielded up, in each instance, men who had been and still are prominent in the so-called "grape organizations." That is to say, their interests as bootleggers, and as "grape growers"—since no one of them owned an acre of grape-producing land—made them highly eligible for prominent parts in the Grape Protective Association, and in the Vineyard Products Protective Association as well.



Above—The raisin grape industry, now prospering as never before, wants prohibition to remain, as do also the grapejuice makers.

At left—The former brewery of Henry Widenmann, of Vallejo, near the Mare Island Navy Yard, California.



Above—A Japanese still. The Japanese, who have long been the most numerous and most successful violators of the law against the bringing in of habit-forming drugs, are just beginning to get into the illicit liquor trade.

At left—Every one of these seven buildings in Auburn, Cal., was occupied by a bootlegger at the time this photo was made by the California State Law Enforcement League.

Dr. Arthur H. Briggs, superintendent of the Anti-Saloon League, California branch, discussing this effort on the part of the organized liquor interests to protect and preserve the bootlegger, an effort which is to be carried to the Supreme Court of the United States, said:

"The first smoke screen sent up was the wine and beer resolution adopted by the San Francisco Chamber of Commerce, the Stock and Bond Exchange and the Board of Supervisors. The action of these bodies was so timed as to give it the appearance of the spontaneous expression of a movement. No argument was made to show that the Wright Act was in any respect an obstruction to the movement, but it was implied that the defeat of the Wright Act would insure wine and beer. Supporters of the Wright Act at once challenged the good faith of the promoters of the wine and beer resolution, pointing out that if they really wanted such an amendment to the Volstead Act, they should be organizing a campaign in the congressional districts to get votes for it, instead of a campaign against the Wright Act, of which the bootleggers would be the sole beneficiaries. The challenge was never answered.

"In connection with the wine and beer movement a propaganda was started to put over an interpretation of the Eighteenth Amendment which would sanction the restoration of wine and beer. The common sense of the state smothered this.

The Nemesis of the Blind Tiger

Here is the complete text of the Wright Prohibition Enforcement Act:

Sec. 1. California hereby recognizes the requirements of the Eighteenth Amendment to the Constitution of the United States for its concurrent enforcement by the Congress and the several states. To that end, the penal provisions of the Volstead Act are hereby adopted as the law of this state; and the courts of this state are hereby vested with the jurisdiction, and the duty is hereby imposed upon all prosecuting attorneys, sheriffs, grand juries, magistrates and peace officers in the state, to enforce the same.

Sec. 2. All acts or omissions prohibited or declared unlawful by the Eighteenth Amendment to the Constitution of the United States or by the Volstead Act are hereby prohibited and declared unlawful, and violations thereof are subject to the penalties provided in the Volstead Act.

Sec. 3. California hereby recognizes that its power to enforce the Eighteenth Amendment to the Constitution of the United States should at all times be exercised in full concurrence with the exercise of the like power of Congress; and to that end, whenever Congress shall amend or repeal the Volstead Act, or enact any other law to enforce the Eighteenth Amendment to the Constitution of the United States, then the provisions of sections one and two of this Act shall apply thereto.

Sec. 4. Nothing in this act shall be construed as limiting the power of any city or county, or city and county, to prohibit the manufacture, sale, transportation or possession of intoxicating liquors for beverage purposes; and all fines and forfeitures collected under any ordinance now or hereafter enacted in the exercise of such power shall be paid into the treasury of the city or county, or city and county, whose ordinance is violated.

Sec. 5. The phrase "Volstead Act" as used herein is defined as title two of the Act of Congress enacted October 28, 1919; such title two being enacted under the authority of the Eighteenth Amendment to the Constitution of the United States and providing for the enforcement thereof.

Sec. 6. Should any section or any portion of any section of this Act be found unconstitutional, the remainder shall continue in full force and effect, it being expressly declared that such is the intention.

"The next offensive attempted was to make the Wright Act appear a camouflaged Harris Act (the latter having been defeated in 1920), but it was shown by the supporters of the Wright Act that the very objections which the liquor interests made to the Harris Act in 1920 were met by the Wright Act this year, so that, one way or the other, the liquor interests were and are insincere. . . . .

"The bootleg graft in San Francisco uncovered by the energetic prohibition director, Samuel F. Rutter, has been a factor in revealing the source and character of the opposition to the Wright Prohibition Enforcement Act. San Francisco has been the stronghold of opposition to the enforcement of the Eighteenth Amendment since the outset. Social aristocrats cannot indulge in intoxicants as before prohibition came in, without certain consequences, and these consequences are that they become the accomplices of the wine maker, who commits perjury by making false reports to the government, and of the bootleg retailer, who bribes policemen to protect his business."

Paving Prison Road—Ease, Luxury, Smartness

Defects in Character and Training Most Frequent Causes of Crime

By ALBERT SIDNEY GREGG

IT HAS been the opportunity of the writer of this article to come into close contact with certain types of criminals, and to put them under analysis to find out "what made them thus." Any one would furnish material for several thrilling novels.

The purpose is to present a study of cases without deductions in support of any particular theory. Some say that crime is the product of heredity, others that it is the product of bad environment. I can show glaring exceptions to both rules, which simply cannot be explained. Dope, drink, degeneracy, idleness and moral weakness are the underlying causes apparently, and yet some criminals are singularly free from the so-called common vices. A desire to get rich quick, willingness to take chances, and a feeling that it is easy to escape punishment with the aid of crooked lawyers, are outstanding features of the crime situation today. Judges and prison authorities in a score of leading American cities agree that most of the lawbreakers of today are younger than those of 10 or 15 years ago. They are also more numerous. In some sections many are physically undersized, and a large percentage are mentally inferior.

A New York judge says: "Modern criminals are practically young men between the ages of 16 and 26. When I was growing up here in the Metropolitan district, burglars and highwaymen were all matured men, and big burly fellows with significant nicknames. The lithe, sharp-featured, fairly well dressed young criminals of today, with their handy guns and unlimited nerve, were practically unknown. The old-timers got drunk on whisky. Today most of the younger criminals are dope fiends, who will do anything to obtain a supply of drugs. They are recruited from the loafers who throng our streets. They have made up their minds that they will not work. They loaf in pool rooms, hang around bookmakers, bet on the races, shoot craps, sponge on their mothers and sisters, and prey on unfortunate women. Life with them is a gamble."

The Criminal of Today

THE professional criminal of today lives in apartments or hotels, and is often a man of family. He dresses well and mixes well; in general conduct attracts no attention. Every development of science has been appropriated by him for criminal operations. The motor thief has taken the place of the horse thief, and the highwayman of today makes his get-away in a car. The safe-blower is being crowded out by the forger who obtains bigger results with a pen and ink and a blank check, than he could with a drill and nitroglycerin. Pickpockets and sneak thieves are taking business away from burglars and housebreakers, and bootleggers are becoming rich. Killing by proxy has become a fine art. Gunmen are available who will kill your man for a price, and escape unpunished.

Lawbreaking is an organized business. Expert criminals have lawyers retained in all the large cities to look after their interests—to provide bail and "beat the case." Politicians and criminaloids among business and professional men are ever ready to take care of the younger criminals who are willing to do dirty work for the higher-ups in exchange for protection.

In several cities crime has been openly recognized as a business, and organizations have been formed to fight lawbreaking with business methods. To that end all known criminals and public officials are card indexed, and a daily record kept of their activities, together with information about new crimes. This system does not actually prevent lawbreaking, but it does fix responsibility for any inactivity or irregularity on the part of police or courts. Officials in the cities named can no longer let criminals off with little or no punishment, and escape the consequences. They are kept in line by the fear of press publicity, based on what the card records show.

It is the opinion of men having most to do with criminals that punishment alone does not cause a change in character. Every year the prisons receive many thousands of men and women who have served sentence after sentence. These include not merely those addicted to the undermining and destructive vices, but those who commit serious crime, and are punished with longer sentences.

Mother Takes the Blame

FOR the foregoing reasons judges lay great stress on probation and indeterminate sentences as a means of effecting reformations in criminals. They advocate custodial care for the mentally deficient, or the defectives. Likewise, they say hardened criminals should be locked up for the protection of society.

If it is true that criminals are unable to profit by experience or example, then capital punishment as a crime preventive is a failure. An important preventive measure, say the experts, is to provide employment for prisoners so they will have something to do as soon as they have been released.

Julius Aborn, alias "The Wizard," was caught and put on trial for murder in the first degree, for participating in a pay-roll holdup, in which two men were killed in cold blood. Aborn testified against others in the gang, and three were executed. Inasmuch as he had been of service to the state, there was a disposition on the part of officials to let Aborn off with imprisonment for life, if he would enter a plea of guilty to the charge of murder in the second degree.

But the public demanded blood, and it was thought best to delay action until the cry had subsided somewhat, so it would be safe for the judges to be lenient. Not a particle of evidence was produced to show that Aborn had any part in the killing. He was merely one of the gang, and not very active at that. While the matter was pending the writer met Aborn's mother, his half sister, his brother and his stepfather. It was a strange mixture of human qualities. The mother was from Southern Europe. She was a woman of imperious will, keen intellect, consuming ambition and utter fearlessness. She had quarrelled with her son and her husband, and had decided that her daughter should marry a certain young man, not wanted by the girl. The girl and Julius were great chums, and the girl was determined to save Julius. The uncertainty got on the nerves of all. One morning in the courthouse, the mother suddenly raised her hands in oriental fashion and cried out:

"Let them send me to the chair! Let them send me to the chair! I am the guilty one. I made him what he is. Let them punish me, and not my boy."

Over in the county jail was Julius, with frank, open face, putting in his time over a pile of books. He looked and talked like anything but a killer. The little half sister, with her dark eyes and pretty face, and utterly devoted to Julius, was equally studious. She always carried a book which she read during the hours of waiting. The other brother did not give much time to books, but was a hard worker. All he thought of was to save his brother.

Later I had a talk with the mother. She was much subdued. At length she agreed to tell her story.

"In the old country," she began, "I was a rich young woman. I came to America with my husband expecting great things, but was terribly disappointed. He could not get into a money-making business, and we lived on my money until it was all gone. Then we had the boys, who were very little. I was ambitious. I wanted to make money, but thought I could not do it here. So I went to other cities, leaving the boys behind. They got into trouble on the streets and the juvenile court took them. When I came back I would fight with the court to get them back. Then I would go away again. Finally they got big enough to strike out for themselves."

Julius had been mixed up with a gang. The other son had gone straight, and earned a living. Both had been neglected while young. As they grew older they took different paths. What is the explanation? Was it a throwback in heredity that made them different? Theoretically, as a result of environment, both should have become criminals.

Julius said his life had been filled with disappointments. On the night the robbery was planned he had been home. His mother had nagged him for the way he had been living. Discouraged, he went to a pool room, met some of the gang, and in his despondent mood exclaimed, "What's the use?" and fell in with the plans. The fact that he sought consolation in a pool room is significant. He did not become a criminal by sudden impulse, nor because he was naturally vicious. He got in with the wrong crowd.

Stolen Money That Didn't Stick

HARVEY BARNES is doing time somewhere on the Pacific Coast. He says he is the victim of a "frame-up" by San Francisco politicians, but the records tell a different story. When he was 18, Barnes placed wagers on the ponies at St. Louis races and won, and he became a professional gambler. In 20 years he traveled all over the world, and won and lost $10,000,000—mostly on horses. At one time he conducted a big swindling scheme in Chicago, consisting of a mail-order plan for placing bets on races. It was much simpler than a handbook. Patrons merely sent him their money in response to clever advertisements which promised vast returns.

His state of mind was bad enough, but what about those willing to profit by his stealings? He cleaned up $800,000 in one year, during which time he paid $50,000 for protection. When the time came to raid his place, he was given notice at 9 a. m. by the police that they would call at 3 p. m. to arrest him. That gave him time to get his associates out of the way and to have a bondsman ready. His arrest did not discommode him in the least. It was a mere formality. He gave bail at once, jumped his bond, and later reimbursed his bondsman, all part of a prearranged plan.

Finally, Barnes quit the game and became a reformer. He visited the big cities of the East, and participated in crusades against race-track gambling. The government frequently used him as an investigator. His knowledge of the underworld enabled him to get information beyond the reach of ordinary operatives. Eventually he turned up as manager of an oil stock concern in New York, where he made good money until put out of business for alleged misrepresentation in advertising.

The writer of this article was intimately associated with Barnes for five or six years, and had unusual opportunities to study the operations of his mind. Barnes could tell most amazing things about coming events in the "upper reaches" of the criminal underworld, which includes some men active in big business and politics.

One prediction related to John R. Walsh who was doing time in the Federal prison at Leavenworth, and C. W. Morse who had been sent to Atlanta for 15 years. Barnes told the writer months before it happened that both Walsh and Morse were to be pardoned so they could die outside the walls of a penitentiary. He even explained how the deal had been fixed, and how much it cost. Later Walsh and Morse were released as Barnes had said they would be. Walsh died soon afterward, but Morse recovered and made another fortune.

Barnes did not consider himself a criminal, merely smarter than the other fellows. The point of view which regards downright criminality as justifiable shrewdness is responsible for a great deal of high-brow crime—the kind committed by the "rich and respectable" folks. It is regarded as perfectly all right by many to disregard prohibition when they want something to drink. They would not think of engaging in liquor running themselves, but they are ready to pay another man to break the law. There are others who would not steal, rob a bank, or kill, but they are willing to encourage such crimes. And yet the man who incites others to crime feels that he is superior to the roughneck who does the dirty work.

Barnes had a keen mind of the quality that makes a great manager, but there was a singular kink in it. He had to make money by hazard or a turn of chance or he was not satisfied. The ordinary processes of industry were irksome to him.

During the days when he was a "high roller" on the turf, he formed luxurious habits. It was that combination of defects—the love of a hazard, luxurious living, and fondness for excitement that prevented him making a place for himself in the business world, after he gave up racing. He did not have any vicious habits. He was not immoral, and he did not drink. He was not profane nor vulgar. He had a splendid wife and an adorable mother. In a burst of confidence he told me one day that his mother had taught him to say his prayers, and that he still prayed every night before he went to sleep. He had been a man of prayer all through his career.

"Something for Nothing"

"A LITTLE different twist in his mental make-up, and he might have been a great success in another direction. His mind had acquired a fatal quality as the result of gambling—love of easy money and luxury—which has practically ruined his usefulness.

Once a young man develops an appetite to get something for nothing, and to get it quick, he simply cannot fit into the grinding routine of honest industry. It matters little whether the hazard is taken in shooting craps, playing poker or flirting with the stock market, the effect is just the same.

Dan Morton had a mentality of a different type. He got his start in a newspaper office, and eventually developed ability as a clever advertiser. He knew how to frame small ads that brought orders from all over the country for his love powders, advice to lovers, and similar questionable offerings. Finally he ventured too far, and Uncle Sam got him. He was tried in New York and convicted, the penalty being a year in the penitentiary and a fine of $1,000. He gave bail which he jumped and went to Europe, where he stayed for a year. When he came back, apparently everybody had forgotten him. He obtained work as a printer, and got along fairly well as long as he stayed sober. He was a periodic drunkard, and went on a spree several times a year.

After wandering for years, Morton came back to New York. He could not resist the fascination of the place where he had been found guilty and sentenced to prison. Hovering over him was the fear that he might be caught, but as time passed that fear vanished. While on a prolonged spree Morton was put in a cold room in a New York hotel, and almost perished from exposure. He was rescued by a missionary, through whose influences he became a Christian. Morton quit drinking, and became active in the missions of New York.

Helping the Penitent

ONE night Morton awakened to a realization of the fact that he was a hypocrite. He knew that he belonged in prison. Then he did a heroic thing. He told his associates what he had done, and announced that he had decided to give himself up and serve his term. Every one advised him against such a course. The judge sent Morton to Blackwell's Island. While there he was very active in religious work. He made a vow that when he got out he would expose dishonest advertisers. Morton was pardoned by President Wilson after a few months. Then a business man who had heard of Morton came forward to give him a job, and later staked him for the initial number of a magazine that Morton had vowed to publish. He began his publication practically on faith, for he could not see further ahead than the first number. A desperate struggle followed in which failure stared Morton in the face for several years, but now his magazine is a paying proposition. Swindling advertisers fear this man more than they do the police. Morton is one of the few men who have really "come back" in middle age, once started in the wrong direction.

Now comes a story in which the score is against environment. I was talking with a noted detective about the best way to handle young men who steal from their employers.

"In such cases," said the detective, "my plan is to give the offenders another chance. First I obtain a written confession, and a promise to return the stolen money. Then I help the young man to get a job, in which he will not be required to handle money. This arrangement is always made with the full knowledge and consent of all the parties interested. I have cared for 75

What Oxford Does for the Rhodes Scholar

Learns to Seek Out the Best in Whatever Engages His Attention

By PAUL BOWERMAN

I FIRST came across Rhodes Scholars in Italy, in a little village at the northern end of Lake Garda. Going into an ancient cathedral one morning, I noticed two Americans inspecting the carved stone that made the church worth seeing. In the next moment we were acquainted, and before the day was over, plans had been formulated for a pilgrimage to Venice—a typically American proceeding. In the fortnight that followed I had ample opportunity of noting in them a point of view toward things artistic that was strikingly different from that exhibited by the average American boy of their age. From what I could gather of their life in a small Ohio county seat and of their college days in an obscure Middle-West institution, it was obvious that their taste and discrimination and catholicity of viewpoint had been fostered elsewhere. And that had been, of course, at Oxford.

Magdalen College

Later I met others in places ranging from Stamboul to Normandy, and invariably they made the same impression upon me. Their personalities differ, but their point of view was strikingly identical. They had learned to seek out the best in whatever engaged their attention, and they brought to this selective process a critical standard that was refreshingly sound. At heart they were as thoroughly American as could be found anywhere—good-natured, aggressive, and occasionally tumultuous. In outward appearance and behavior they represented the American college boy at his best. The subtle difference, I decided, was the impress of Oxford.

"Surely," said Hawthorne, "the world has not another place like Oxford; it is a despair to see such a place and ever to leave it, for it would take a lifetime and more than one, to comprehend it and enjoy it satisfactorily." The sheer beauty of the town alone would be enough to instill a heightened appreciation of things most worth while, and to foster a love of the beautiful for its own sake.

The beauty of Oxford is the result of the application of culture and refinement throughout centuries of slow growth and improvement. It is not the charm brought forth at a given moment by the skill of an architect, but by the intermittent and overlapping efforts of a succession of inspired dreamers.

The Quadrangle.

There is a small college not far from Chicago which has sent three Rhodes Scholars to Oxford. I know it by sight and reputation—a row of red brick buildings separated from a dusty highway by a plot of ground set with scrubby trees. In front, an incessant honking of automobiles all day long; behind, the roar of suburban trains at eight-minute intervals. I had the pleasure of seeing one of these boys in his new quarters. The walls were hung with prints and etchings. The shelves were full of books that spoke for themselves. From his window I could see a patch of velvet lawn surrounded by ivy-covered cloisters, and at one side a lazy brook wandered among a profusion of flowering shrubs. Two mottled deer were running beneath a grove of giant elms, their hoofs making no sound on the turf.

"A bit different from——," I remarked.

He smiled. There was no need of an answer.

Founder's Tower.

His was an extreme case. There were others who had been more favored in their preparation for Oxford, ones whose early environment had closely approximated its charm. Yet even these favored few were keenly conscious of that subtle difference which distinguishes the old university town from anything to be found in America or any other country.

Three years of constant association with beauty cannot fail to leave their impress upon the least susceptible mind. Peace and tranquillity hover over the ivy-wrapped cloisters and the quiet waters of the Cherwell and the ancient quadrangles. However bustling and animated may be the traffic in the town, there is always a restfulness behind the protecting walls of the colleges, a feeling of aloofness from the cares and worries of the world outside. The student has time to read, and to dream over his reading. He has time to train his mind to reason coolly and dispassionately. He has ample opportunity to cultivate his taste for the best things of life. He has both time and opportunity to find himself and the niche he is best fitted to fill in the later years.

To a lesser degree this is true of every college the world over. Oxford and Cambridge approach perfection. The tendency among American colleges during the last decade has been to emphasize the utilitarian phase of education at the expense of the cultural, although a reversal of the pendulum seems imminent. Oxford has never swerved from its original purpose, clinging tenaciously and sometimes absurdly to its archaic organization and routine. The Rhodes Scholar who goes to England to equip himself for some definite activity in the world of finance labors under a delusion that is soon destroyed. Nothing could be farther from the aim of the learned men who control the destinies of the various colleges.

The difference is that between an educational institution and a seat of learning, between "studying" a certain branch of learning and "reading" in that subject. There are no classroom recitations at Oxford, examinations are infrequent, and the student's connection with the faculty is limited to a weekly conference with his tutor and occasional attendance at a lecture. He spends the morning in reading, the afternoon on the athletic field, and the evening in conversation.

From the point of view of many of us, it would seem a great waste of time and money. Yet behind the apparent ease and leisure, there is an amazing intellectual activity among the undergraduates— an activity that is not dissipated upon a score of outside interests. I should like to recall a few incidents that came to my notice to illustrate this point, for if we base our judgments upon results, they are interesting in themselves.

One evening I found myself one of a group of students who had gathered by chance in the rooms of an American. They were in no way different in age and appearance from a group of seniors in any college. The charm and polish of their conversation alone distinguished them. Before a very pleasant half-hour had slipped away I discovered that one of them had just published a first volume of poems which had been highly praised by the best critics of the day, and, in addition, that he had a play running in one of the London theaters. Still more interesting was the discovery that another of the group had already produced two novels and conducted a literary column in a newspaper of world standing. Still another had won first honors in the examinations for the diplomatic corps and was only waiting to complete his course before assuming a responsible position in an important embassy. A fourth had exhibited etchings in the National Gallery. The others, without exception, had accomplished something of but slightly less prominence. Their ages ranged from 21 to 24, and they came from widely varying stations in life. Surely something more than mere chance had a hand in developing those minds to such a maturity. The best part of it all was their unassuming manner, their love of cricket and tennis and rowing, and their enthusiasm for the better things of life. The more I went about Oxford and met various groups, the more I was convinced that such men as these more nearly approached the rule than the exception.

The Union is an honored institution in the university. Here are held the debates between undergraduates or between undergraduates and men of political prominence, at intervals throughout the college year. I had the privilege of hearing a debate between a member of the present Coalition Cabinet and an undergraduate. The latter attacked the policy of the cabinet in no uncertain terms, driving home several telling points, and quite unabashed by the prominence of the man he was challenging. In response, the minister was forced to exert himself to the utmost to defend himself and his colleagues, knowing full well that his speech would be quoted word for word in every London paper the following day. It was no easy task. By the brilliance of his thrusts and the coolness of his argument, the undergraduate had presented his case as cleverly as any Member of Parliament could have done. In the minds of the referees the minister won his case by a slight margin, and he returned to London satisfied that he had justified the existence of the Coalition Cabinet; for the Union debates are a matter of national importance.

A very large proportion of the men prominent in political life received their early training at Oxford and Cambridge, and the two universities are thus a natural beginning for the men who conduct the affairs of the British Empire. The undergraduate who decides on a political career enters upon his task with a high seriousness, leaving no stone unturned in his efforts to equip himself for the position he hopes ultimately to attain.

There is a very strange attitude toward debating in most of our American colleges. A student who devotes himself to that branch of activity is looked upon in much the same light as the one who dabbles in poetry. His prestige on the campus, his popularity with his associates, suffers from it. I believe this attitude to be the result of our method of conducting classes in oratory and training debating teams. In general the student is taught the mechanical tricks of oratory—the gestures, the stance, inflections of the voice. To practice these newly acquired tricks he is given selections from Daniel Webster or Robert Ingersoll to recite—a form of public speaking which is as obsolete today as a coach-and-four, except in those parts of the country where the spirit of the last century still flourishes. The inevitable outcome of such a training is to make the student of oratory a mechanical machine, a speaker whose interest is more concerned with the details of correct delivery than with the subject-matter of his speech. Our intercollegiate debates are for the most part uninteresting for that reason, and the average undergraduate is prejudiced against it. Thus arises the attitude toward the student who interests himself in that activity.

An interesting comparison was afforded last year when the debating team of a New England college, prize winner in an intercollegiate competition, was sent to Oxford to speak against a group from that university. It is a humiliating fact that the Americans were a laughingstock for the rest of the term, and the Rhodes Scholars blushed whenever the word "debating" was mentioned. The English boys spoke in a natural offhand manner, without a great deal of preparation, without mechanical gestures, with no election-campaign tricks of inflection or thundering climaxes. Instead, they relied upon a combination of good sense and delightful humor to carry the day, and they did it with an ease and coolness that made us seem ridiculous.

The Americans conformed to the teaching of their instructors and coaches, memorized their speeches word for word, and found themselves utterly at a loss when confronted by the necessity of making a slight alteration in a preconceived plan of attack. They had been taught to speak, but they had not been taught to think. The outcome was not only a reflection upon our methods of debating; it furnished food for thought in considering the comparative maturity of mind among the undergraduates of England and America.

There are no two colleges in America which hold a position comparable to that enjoyed by Oxford and

A Neglected Science—Picking an Employer

Accident Too Frequently Selects the Job, Failure Is the Doom

By EARL R. BUELL

WANTED: A high-class employer, willing to attend to business, honest, energetic, gifted with foresight, intuition, and capable of understanding the position and requirements of his employes. Must have considerable capital and furnish best references from leaders in the community. Apply Post 41.

Nobody ever saw a "want ad" like that, and as likely as not, nobody ever will; yet on every hand we find newspapers full of columns of "help wanted" advertisements in which the employers demand all these things from their prospective employes.

The hiring of one employe is of minor importance to the employer, while a new boss means the difference between prosperity and poverty, happiness and misery, perhaps all his life, to the employe. Why should the employer do all the picking?

Does it ever occur to anybody to ask why Alfred Larson is driving a truck, while George Albright is the manager of a wholesale fruit house?

It is probably not because Alfred Larson had any great and uncontrollable desire to become a driver of a truck. Nor is it probable that George Albright set out definitely and directly to become manager of a wholesale fruit business. It was all tossed into the lap of fate in the great gamble of the job.

George Albright's father and Alfred Larson's father, coming home together by an unexpected way, found George and Alfred shooting craps in the alley behind the drug store. Each parent seized his offspring and administered, besides a liberal massage treatment at the base of the spinal column, a woodshed lecture of high moral tone, touching on the evils of gambling, on the demoralizing effects of games of chance, and each flatly ordered his son to go forth on the morrow and get a job.

"Get Something to Do"

"YOU go to work," George Albright's father said. "You start out tomorrow and get something to do. I don't care what it is. Take any job that you can get, just so you can get some kind of a pay envelope on Saturday night, and don't let me catch you doing any more gambling."

Alfred Larson's father told him, "There is a sign 'Boy Wanted' down on Thirty-second street somewhere, about four doors above Twelfth avenue. I don't know what kind of a store it is, but you go down and apply for that job, and don't come back here till you get it, or one like it."

The sullen boys started out next morning, as it happened, together, and at the same moment Lady Luck, seizing a pair of celestial cubes, made a divine pass and sevened. Alfred Larson found the sign at a grocery store on Thirty-second street, and came back home that night a delivery boy. George Albright began on the following day his career in the wholesale fruit business by mailing 75 letters, running eight errands, and swiping the chewing gum that belonged to the stenographer.

In less than six weeks Alfred Larson proved his total unfitness to deliver groceries. He reported at home with a blue envelope and was ordered to try again on the following morning. He hadn't the slightest idea where to go and presented himself next day at an employment agency, paid a registration fee and asked for a job.

"What have you been doing?" he was asked. Alfred told them. "Well, here's a grocery on Eighty-seventh street that wants a delivery man." Alfred got the job, and held it for six months, and then he was an experienced man in the grocery business. Two or three grocery stores later he began driving a delivery wagon. And that's how he came to be a truck driver, ultimately a truck driver for the wholesale fruit company, managed by George Albright.

Why George Got the Job

THE strange thing is that George Albright is not much of a manager. He worked up into the manager's job simply because he wasn't sufficiently interested in anything else to fail at the things he was instructed to do. He got by as an office boy. He was made a clerk in the sales department, and working with half or a third of his ability was no better or no worse than other clerks in the department. Pete Hawkins, the sales manager, liked him, mostly because he shot a pretty good game of pool. They hung around together a good deal, largely because Hawkins wouldn't hang around with the salesmen who might get too familiar. One of the salesmen fell down once too often and George asked Pete for the job.

"You couldn't do any worse than that fellow," Pete said, and gave it to him.

But because he was a likable cuss and had just enough interest in his new job to make calls, he hung on as a salesman. Hawkins got a better job a few years later, and for the sake of the old Kelly pool games, recommended George to be his successor.

The manager who made the selection was a slow thinker and George was just enough faster with his mind to command his respect. When he got to be sales manager, George did have sense enough to watch the sales expense. When he found that a man wasn't going right or didn't seem to fit in, he did him the kindness of turning him loose and hiring somebody else. By keeping up this process he finally picked out of 30 or 40 men the ones who were conspicuous for ability, and made himself quite a reputation as a sales manager.

His showing at the end of five years was such that when the old manager resigned, George was given the job. Once again he got by, mostly because he was too indifferent or too lazy to interfere with the people who were doing the jobs he couldn't do. Taking his own experience as something of a guide, he picked the poorest salesman he had and made him sales manager, mostly because he didn't want to take a good salesman off the road. It just happened that the man had more organizing ability and directing enterprise than anybody else in the place, and the combination worked out all right.

But all this time George was dissatisfied. He wanted to be a magazine writer, and kicked himself constantly for letting business interfere with this desire. His job paid him $100 a week and he had a family by this time, so he couldn't quit.

Alfred Larson, driving the big truck for the house, used to look enviously into the manager's office every time he went by and George would greet him with a wave of the hand or a prodigious wink as a sort of acknowledgment of the mutual memory of the crap game in the alley. Then one day Alfred drove the truck home with a grind in the differential and cost the company more money to get it fixed than he had ever drawn down in wages. George fired him.

Alfred looked at him a minute and then he said, "What good will that do?"

"Well, it will save the next truck anyhow," George said.

"I don't know whether it will or not," Larson responded. "You'll probably hire somebody else that has no more business driving a truck than I have."

"What do you mean by that?" the manager inquired.

"You hired me, didn't you?"

"Well."

"Well, I had no more business driving than I did playing a violin. Somebody made a driver out of me, or tried to, and I let them. My trouble was that I didn't go to selling long ago. Now I'm going to do it, if I starve in the attempt."

"Why didn't you say so? How did I know you wanted to sell? And what do you want to sell?"

"Anything at all. I don't care if it's books. All I want to do is to rub up against the right people and see if I can't find the ones that want to buy from me."

"Huh! Why don't you sell fruit?"

"I don't care what I sell. I can sell more fruit than a lot of your salesmen, but I don't suppose you would care to take a chance."

George pondered.

Alfred Starts to Sell

"WHY not?" he said presently. "The worst you can do is to lose a couple of good customers for us, and that won't be much more costly than jamming up a brand new truck. You've been here long enough to know something about fruit. You know where it goes when it goes out of here, and there's just a chance that a rotten truck driver may be able to do something right."

There are plenty of Georges in the world, and plenty of Alfred Larsons. Half a dozen failures point in the general direction of success. They teach a man at least the things he ought not to attempt. If a man fails often enough he will at last find the thing he can do.

Ask a few business men about the jobs they failed to hold and you will be surprised. By far a worse thing than failure is a merely moderate success. There are some men who seem to be able to do almost anything passably. They can write almost well. They can speak fluently. They can handle men with apparent facility. They can plan activities with fair success. They can carry out a plan in a reasonably competent way. These are the men who fall far short of big success.

Physical disabilities have saved some men from failure. The finest telegraph operator I ever knew was a former brakeman who had lost his leg under a train. Many a wounded soldier will forever bless the wound which made it impossible for him to follow his old line of work and practically forced him to choose something better.

But thousands of men are caught in the swift current of the line of work which is distasteful to them, in which they could not succeed if they lived and worked a thousand years, but which, try as they will, they seem unable to escape. A newspaper man of my acquaintance worked for years as an incompetent stenographer, mostly in railroad offices. Again and again he was discharged from one railroad office only to find himself a few weeks later in a similar position with another road.

Again and again he tried to get into other work besides stenography. But it was only by determining upon the career of a newspaper man and taking a job in a newspaper office at $12 a week that he was able to get free of the railroad business, and even then his first newspaper assignment was to the railroad run.

I know another man who was such a good stenographer that opportunity passed him up again and again to select for a good job some person less indispensable at the typewriter. He finally broke away from the machine by going to a new town and pretending that he could not write his own name on the typewriter.

For the man who is without family responsibilities there is an easy way out of the line of business that is distasteful to him. He has only to resign the job and refuse to take work of that kind again. But to be sure of getting out of one current of life and staying out, it is virtually necessary for him to get into another, and it is here that his ingenuity may be taxed.

In order to avoid getting into a similar predicament in some other line, it is necessary for him to make a careful preliminary study of the line he believes acceptable to him. Unless he has a definite urge to become some one thing, the selection of his new career is for him a matter of deep concern. It is not alone enough for him to select the line of business in which he would like to become interested, but he must, to steer a proper course, determine just what department or what position and with what company he would prefer to affiliate himself.

In determining to become a bank president it is well to know something about a bank president's duties and responsibilities. It is advisable to study as far as possible into the difficulties which beset the embryonic bank president in the early stages of his career, and to decide whether or not the game is worth the candle.

A great many men all over the country have decided without any particular cerebration on their part that they wanted to be advertising men. Some of them have only the slightest conception of the duties of an advertising man, of the talent required, or of the serious effort involved. If those persons who wish to become advertising men were first to seek, in the libraries and magazines, information concerning the advertising business or the advertising departments of businesses; if they would talk with advertising men and with persons in the offices of advertising departments, they might learn that the barber trade was far preferable. It is proper to suggest, therefore, that men decide cautiously what careers they wish to pursue.

Find Out What You Want

IF, HOWEVER, the man has a great outstanding desire to become one thing and is confident within himself that he will never be satisfied until he becomes that thing, it is highly probable that he will find the way to his goal, and that in the struggle to attain it, he will become qualified.

Having determined then the position one wishes to achieve, it is necessary only to set out in the direction of the goal with the firmest possible purpose, taking advantage of every natural gift, of all previous experience and of all intuition, imagination or concentration possible to seize the desired position. For those who have failed in many things, a great surprise is in store, for if they have chosen wisely and correctly the thing which delights their heart, the same kind of a current which sucked them irresistibly along against their will before is now sweeping them on with almost as much resistless force toward the goal of their desire. When once they have been picked up by an eddy from this current and drawn into the main stream, they are carried with it as greatly to their delight as formerly to their chagrin.

Delighting in the work, they do it well, and doing it well, they delight in it more and more. Enthusiasm rises high. Disappointments serve only as momentary setbacks. They are as little affected by them as is the drifting leaf by the pebble which catches it for an instant and then lets it hurry on.

Hours of effort that were leaden fly by on wings, and the worker ceases almost entirely to take account of the amount of work he does and the length of time he spends in doing it. He accomplishes more and is anxious to work more than ever before.

It is at this point that the absolute necessity of the right choice of an employer becomes more important. The right kind of an employer takes account of this new enthusiasm, this forgetfulness of time and effort, and rewards the worker accordingly, basing the ratio of the reward to the amount of work accomplished, the quality of the work and the value of the work in the organization involved.

Working for Own Interest

THE finest workman in any line cannot expect to receive full value for his services if he is working for a company that cannot make the most of them. For this reason the choice of an employer means as much the choice of the company to work for as it does the choice of the man under whom the work is done. In a general sense the big man will be found at the head of the big company or developing a small company into a big one. It is far better to work for a big man who is developing a small company into a large one than it is to work for the big man who is at the head of an organization already formed and unlikely to make any great change in his policy or increase in development.

The great question next arising is how to tell a big man when you see him or have dealings with him. The methods to be used by the employe in such a case as this follow naturally the methods used by a bank in determining the desirability of making him a loan. In addition to these methods the employe should take into consideration other matters having to do with the attitude of the employer toward his employes, his history as regards the advancement of employes and his talent for developing employes to the limit of their capability. These matters, of course, should be taken into consideration by a bank in making a loan to the business man, but it is not often that a bank can go this far in its investigation of a man's responsibility.

External characteristics of the man are not always to be relied upon. The employer who is studying his employes most carefully may be the preoccupied type who fails to speak to them when he meets them on the street. The employer who is most affable in granting an interview to a prospective employe may have only

Interest—The Nation's Old-Man-Of-The-Sea

Unescapable Under the Present Money System! James Holden's Reaction to the Facts of Everyday Business

By JOHN BASIL BARNHILL

Editor's Note—The following article is not presented with any purpose save to throw a light on Interest. Holden's reaction to the question in his proposal of land certificates may or may not be wise—on that we say nothing. THE DEARBORN INDEPENDENT *is not proposing any cut-and-dried solution. It is primarily interested in encouraging its readers to look the Money Question in the face. To this end it publishes articles from all angles.*

"MANY years ago I was in the business of lending eastern money to Kansas farmers. I loaned a million and a half dollars and I watched those farmers sweat over their rich soil to pay the interest. It was my business to get that interest, so I watched them closely and I know what it meant to them. Then one day it struck me as absurd that these men who owned their land, their horses and their tools should have to hire the money with which to carry on their work. Why shouldn't they own their money too? It was but another tool of their trade! I then discovered that Congress provides only a small fraction of the money that producers require to carry on production, and that the dearth of money forces the use of bank credit in commercial transactions."

In the foregoing words James Holden explained how he, a real estate agent and usurer, was transformed into a reformer and opponent of interest; like Paul of Tarsus he was smitten to his knees by a great light; he saw the "vision splendid" of a liberated humanity.

The record of his struggles against poverty, apathy and countless obstacles while fighting for the recognition of his remedy would transcend the bounds of human belief if one did not know that in every prophet is a Mother-Calculus which measures its joys by its sacrifices.

The inspiration was complete when Holden realized that all the banker does is to *monetize the value of the farm!* And as there must be an entering wedge to every movement the prophet proclaimed his doctrine of land currency. The government says that *currency issued on gold* shall be legal tender; Holden would add valuable land and other forms of wealth.

Dr. Crane a Convert

ONE of Holden's converts is the journalist, Dr. Frank Crane, who, in a magazine article, says:

"The proposal is to base currency, not on gold, which varies in quantity, but upon the MOST STABLE, GET-AT-ABLE AND THE MOST INDESTRUCTIBLE THING KNOWN, to wit, LAND! Let any man owning a piece of land—town or country—go directly to the government, *monetize*—not mortgage—his land to it at one or two per cent, and receive 40 per cent of its value in government bills, which shall be legal tender for everything. This land currency can be issued without disturbing present conditions and without introducing any new and debatable principles in finance. Every dollar would be worth a dollar; it would be sounder than the present gold dollar. The plan would enable any man with property to get what money he needs without going to the banks and paying interest. Vast sums of interest would be saved to the people! War is not the only relic of barbarism that robs the human race. All business carries an Old-Man-Of-The-Sea on its back. This incubus is the CREDIT-MONEY manufacturer to whom we pay a colossal load of interest."

In an endorsement of the Holden plan, Mr. Arno Dosch-Fleurot, at present European correspondent of the New York *World,* writes:

"Holden holds that the dearth of legal tender is the cause of poverty! According to Holden, the root of all evil is not money, but the lack of money. He wants us to issue money on land because he feels land is safe backing. But his primary object is to create enough money to go around! We are always up against it for money BECAUSE THERE IS NOT ENOUGH MONEY. The dollar is elusive because *there are six owners of each real dollar!* We cannot get what does not exist! Five of us are bound to be disappointed! More than five—as it has worked out—*are* disappointed, because MOST OF IT HAS ALREADY BEEN CAUGHT. We are compelled to borrow it of those who have been clever or canny enough to corner the scant supply. In course of time they have accumulated more than their share, and, if we want any of it, we must pay them for the use of it and HELP THEM TO ACCUMULATE MORE! This process has been going on for centuries! In every new country it starts anew. That is why the wealth of the world concentrates in few hands, and the older the country the harder the conditions of life! INTEREST DOES IT, and, as things stand, we must pay the interest annually on more than 30 billion dollars—30 thousand millions—of bank credit substitutes for real (legal tender) money!"

"The Ravages of Interest"

THE writer might have said that this TRIBUTE is paid to the banks by the people ON THE PEOPLE'S OWN MONEY!

Paul Thieman, former editor of the Denver *Post,* in an editorial review of Holden's book, THE DISTURBING FACTOR IN HUMAN AFFAIRS, says:

"Holden's proposition is not humanitarianism; it is not confiscation; it is not socialism—it is something new and unique, though simple, that fits with the present laws and order of society. He traces the origin of all social ills to a FUNDAMENTAL CAUSE, namely, to the RAVAGES OF INTEREST! Interest the UNESCAPABLE! Unescapable under the present money system. Why unescapable? For the simple reason that all business is transacted with *a circulating medium that is limited in amount,* and no matter how much *wealth* you possess you must pay interest to the owners of the fixed circulating medium! Why, to be sure, whether it's the gold standard, free silver, or even the old greenback party idea, the same would be true, namely, a circulating medium for which interest must be paid! I saw clearly the distinction—the enormous and utterly complete distinction BETWEEN WEALTH AND MONEY! I saw the startling point that while civilized society possesses wealth so vast that the figures mean something incalculable, it transacts business with a meager fraction of that wealth in the form of dollars of gold and silver. And this man in calm words was pointing out that the gigantic fabric of modern society was the victim of the rude money system of our barbaric ancestors."

Another convert to the Holden plan was Albert Talmon Morgan, who wrote:

"Your contention that the 'thrall of civilization' is INTEREST; and that interest for money is 'legalized tribute' which can be abolished by 'changing the wording of the Coinage Act of 1792' arrests the attention and tempts the mind to test the character of the arguments put forth to sustain your claim. You marvel that intelligent human beings have for so long been content to pay for the use of a medium for exchanging products of their labor a sum that absorbs their surplus earnings from year to year, and you make it clear to the attentive reader that society will avoid the impoverishing exactions of the usurer whenever it shall provide itself with a volume of legal money equal to its commercial needs. Whether as a nation we have reached that state of mental development, however, which will enable us to throw off our shackles, will be answered by the reception accorded your demonstration—that since gold and silver are simply forms of wealth, by law entitled to money representation in the public circulation on application of the owner; and since certain bonds are also granted such representation, common sense as well as common honesty demand that OTHER equally suitable forms of property be given money representation, to the end that the supply may respond to the requirements of commerce. I venture to say that the logic of your thesis is irresistible; and that the practicability of your proposition as a means of eliminating the charge for currency (while not affecting hire for the use of property) grows upon the mind of the reader and upon his understanding the more he thoroughly weighs the meaning of the terms you employ and the more he perceives the true relation of money to the development of our civilization. That you have solved the great problem by pointing out a feasible remedy for poverty among the industrious will be clear to students of the subject who are ready to accept the truth."

Prosperity Held Impossible

OTHER well-known publicists have signified their acceptance of this philosophy and have written inspiredly on the subject. But the most helpful presentation of the proposed system is to be found in the author's own writings, from which we have selected the following extracts:

SPARKS FROM A PROPHET'S ANVIL

We have officials whose duty it is to provide an adequate supply of money.

Durable wealth may be monetized by the certificate process more effectively than by the coinage process.

Uncle Sam requires security, but no INTEREST, for money obtained from him *directly.*

Should civilized people pay interest to bankers for currency the banks get from OUR government without interest?

Under a sane financial system it would be unnecessary for *producers* to get in debt to *non-producers.*

Society's chronic troubles are MONEY troubles; yet what statesman is seeking the cause where it must obviously reside—namely, in the MONEY SYSTEM ITSELF!

A condition of general prosperity is impossible among a people who see nothing wrong in the act of paying private individuals for the use of their PUBLIC circulating medium! Original recipients—by giving security—get currency from the government without interest; but at present the only "original recipients" are gold owners and a few bankers! No interest is paid by the favored few who get money direct from the government!

What Oxford Does for the Rhodes Scholar

Concluded from page 9

Cambridge in England. They are distinguished from the others by a prestige that has never been challenged. The other universities scattered about England afford equal opportunities for education, some of them even boasting stronger faculties and a more efficient organization. The universities of London, Manchester, Sheffield, Leeds and others are quite on a par with the two older institutions in these respects, but they are conducted on lines more closely resembling the American universities, with the most modern equipment, highly paid professors, and affording almost unlimited opportunity for specialization in technical work.

Oxford is not a democratic university, in the usual sense of the word. It is expensive. It does not encourage students who are not self-supporting, unless they are holders of an adequate scholarship. It is highly individual in character and fosters that spirit among its members. It is made up of a score of independent colleges, between which there is very little intercourse. Its members are presumed to be gentlemen of a definite social standing, with all the significance that the word conveys in England. Of late years, and particularly since the war, there have been changes in this last respect, but the spirit prevails.

The undergraduates of Oxford are the cream of English youth—and when I speak of Oxford I must necessarily include Cambridge—the sons of those families which make up the upper class in the stratified system which England clings to despite all efforts to break it down. They come from families of culture and refinement, and generally of means. They have had every opportunity and advantage in their preparatory work. They do not come to Oxford raw and unfinished, but are at that time as far advanced as many of our college graduates. They have already mastered the studies which take up the first two years in an American college and are ready to devote themselves almost exclusively to the subject which most appeals to them—literature, history, law, economics, or any other.

Some Rhodes Scholars going to Oxford with diplomas from representative American colleges are chagrined at the thought of having to begin anew as freshmen. The delusion is soon dissipated, for the 18 or 19 year old English boys fresh from the best of preparatory schools are a match for them in all but a few branches of study, and are often better equipped to discuss art or literature or topics of the day.

Being the sons of the leisured class they have an advantage in this respect over the scholar, who, however rich he may be in potentiality, has rarely had lavished upon him the care and attention that is the outgrowth of many generations of intellectual superiority and financial ease.

It is the privilege of the American at Oxford, whether he is a Rhodes Scholar or an ordinary undergraduate, to be thrown in intimate contact with this carefully chosen group. If he is to derive the greatest benefit from the opportunity, he must have a genuine love of study, an eagerness to glean as much as possible from the rich heritage of our civilization; he must cultivate the social graces that he may take his place with young men to whom these things come as a matter of course; he must conform to the conventions and traditions so dear to the heart of an Englishman, many of which seem to us futile and even absurd, in our youthful impatience and our passion for system; he must give proper attention to the athletic field, devoting some part of his afternoon to the sport of his choice.

If he fails in any of these respects, he jeopardizes his opportunity to derive the greatest benefit and defeats his own purpose in going there. He will find it impossible to break through the reserve inherent in the English boy, who makes few advances and those only after a period of some length. The Englishman has not the disposition to encourage casual acquaintanceship, but he has a rare gift for friendship of the highest quality, which he offers to those who inspire his confidence in their ability to return it in kind.

The American who fails to inspire this confidence, by not entering into the spirit which pervades Oxford or by not observing the niceties demanded of a gentleman, finds himself shut off from social intercourse with the best element of Oxford by a barrier that can never be surmounted. By doing so, he can never hope to catch a glimpse into the hearts and feelings of the finest product of our Anglo-Saxon civilization. That will remain for him a sealed book forever.

(C) By Fred. H. Kiser, Kiser Studio, Portland, Oregon.

The Forestry Service has completed an auto road to make Elk Lake, Oregon, accessible. It is about 35 miles southwest from Bend and is now greatly frequented by campers and fishermen. The lake is three miles long and three-quarters of a mile wide. South Sister peak, 10,352 feet high, is seen 11 miles away.

A Neglected Science

Concluded from page 10

the slightest conception of what his duty is to the employe who enters into association with him, while the abrupt business man who accords the prospect scant courtesy, apparently, in the first interview may give far more attention to his development and advancement when he has actually entered the employ. The attitude of the employe in entering into employment with the right kind of a superior is of the greatest importance to his success in that employment.

It is folly for the employe to forget that in the last analysis he is working for his own interest. It is ridiculous to ask an employe to forget himself and work only for the interest of his company. No right-minded employer would accept that kind of service for an instant. The company, if it is the right kind of a company, can afford to pay for the interest of the employe, and to pay full price.

But the right kind of employe will readily recognize that when he is employed by a company, his highest personal interest is bound up absolutely with that of the company. If the company or his own department in the company fails to make the proper progress, the effect on his own position, on his own salary, and on his own prospects is disastrous. The employe, therefore, needs no more to be urged to loyalty and devotion in his service to the company than he does to be asked to be loyal and devoted to his own bread and butter, or to his own wife and family.

As a matter of fact, the analogy is close. The devotion of an employe to his company naturally is for his own best interest fully as strong as his devotion to his wife, if he has one, and for that reason it is not only proper but most important that he select his employer with as great care as he does his wife.

In considering the matter of remuneration for any given work, the worker should not lose sight of the intangible values, difficult to compute in money, which may be worth fully as much to him as a money return.

It is no revelation of a state secret to say that newspapermen are often underpaid, or that they would be able to earn more money by the exercise of the same ability and the same industry in another business. At the same time, it is not an easy thing to hire a newspaperman away from the newspaper business. It is sometimes necessary to pay him double the salary he has been receiving to get him.

The newspaperman feels that by virtue of his job he occupies a sort of exclusive position in the business and economic world. He feels that while his power is not great, his influence in the world of affairs is considerable. The association with great men, his constant touch with noted or notorious persons, his opportunity to study every phase of life, make up for him to some extent the rather slim salary he may be getting.

The worker then who is doing the thing he likes to do and feels that his mental or spiritual growth is made possible by his task, rightly considers these things a part of his compensation and does not measure his whole success by the monetary return.

The prospect of future reward can be a very satisfactory incentive for a worker, provided he does not lose faith in the promise.

The chain store employer who definitely arranges that a certain clerk of today shall be the assistant manager tomorrow and that the assistant manager of today shall become the temporary manager tomorrow, and that the temporary manager may become tomorrow a permanent manager with an interest in the business, will find men willing to become clerks and to work as clerks for a considerable time for wages not ordinarily sufficient for clerk hire. He may be able to keep an assistant manager well satisfied with the salary ordinarily paid to a clerk, and the temporary manager in view of the immediate prospect of an interest in some branch of the business and a permanent managership may be perfectly willing to work for the salary that might otherwise have to be paid to an assistant manager.

There is one other method of getting out of one line of business into one more desirable from the standpoint of the worker, and it is especially valuable to those who have taken obligations which make it impossible for them to resign a lucrative position to take one of a lower rank in the line to which they aspire.

A man who has achieved a reasonable degree of success in one line and is well paid may be dissatisfied. He may feel that he is not exercising his abilities in full and he may have a special interest in some other form of endeavor which he feels meets this need. The easiest way out is to take up the new line of work as a hobby, perfecting himself gradually in his spare moments until he has risen to a point where he may turn to the hobby as a regular business, laying aside the position he formerly held.

The value of a hobby is readily recognized by employers of men in almost any business, and it is important for the employe to consider his hobby from the standpoint of its possible development as a remunerative trade or pastime. It is usually just as cheap to support a hobby which eventually may become remunerative as it is to expend a large amount of energy and interest in one which requires a constant outlay without any prospect of return.

So that the choice of a hobby by a person engaged in any sort of endeavor which is not entirely satisfying to him is a matter for careful consideration and earnest study. In fact, it becomes fully as important in this line as the choice of an employer and the choice of a company or line of business. Perhaps the ideal combination is where the hobby and the vocation supplement each other, each lending interest to the other and developing the character of the man and his economic strength.

Paving Prison Road

Concluded from page 8

young men in that way, and all but one or two have made good.

"There are two excellent reasons for this policy. One is that it saves the man, and the other is that it protects society. If I should send every first offender over the road, he would become embittered, and probably leave prison a confirmed criminal. His only thought would be to get even by robbing people. That would make more trouble for everybody.

"Most of the young men with whom I deal do not intend to do anything criminal. They live beyond their means, gamble a little, or maybe drink, and "borrow from the boss with the expectation of paying back." That is the way they sugar-coat embezzlement in their own thinking. In giving them a new chance, I make sure that they have quit the habits that caused their downfall. Once a cure has been effected at that point, the rest is easy."

A police judge once made a decision that has a direct bearing on the subject. In the south end of the city there lived some boys who were full of mischief, and often had a good time destroying property. One night when the city was all stirred up over a possible end of all things as indicated by Halley's comet, these youngsters saw a rare opportunity to enjoy themselves. They reasoned that if there was going to be a blow-up, they might as well have some fun. So they spent the night stealing gates, pulling down fences, and other pranks. Finally they came to a foundry on the edge of a gulch, and finished up by rolling a lot of valuable castings into the gully. On the following day the owner of the foundry had all the boys arrested on the charge of malicious destruction of property. They were clearly guilty, and under the law the judge could have sent them to jail. But he had a better plan.

"Boys," he said, "this thing that you have done is pretty serious, and I may be obliged to punish you severely. But I'll tell you what I'll do. I'll continue the case for 30 days, and if the castings have been returned meanwhile, maybe you won't go to jail."

That suggestion was enough. Those youngsters went to work and returned the castings to the place where they had found them. One or two castings were missing or had been broken, and the boys raised money to pay for the missing pieces. In carrying the castings back up the hill the boys were obliged to endure the taunts and ridicule of other boys who had not been in the gang. Ordinarily such remarks would have called for a fight, but the guilty boys had resolved to pay no attention to remarks until the castings had been restored. Then they would square all accounts. When the case came up at the end of the 30 days, and the facts were laid before the judge, the owner of the castings withdrew his charge and the case was dismissed.

What happened after that? The boys stopped breaking up property just for fun, and formed the Comet Club. They met regularly for years and worked out a program for self-improvement that enabled them to gain positions of honor and trust. Good sense was used by that judge. He could easily have started those thoughtless lads on the wrong course just by imposing a routine sentence. But he obtained justice for the foundryman, and saved the boys from the stigma of the reform school, and a possible life of crime.

Washington Contrasts: 1922

Concluded from page 3

ing corner of delegates and agents and secondary people." Perhaps there is something in that!

At the top of a long flight of steps on the western side of the Capitol building you can look back over the route along which you came. There in the distance stands the Monument, neatly bisecting the Lincoln Memorial behind it. You find it difficult to shake off a feeling of depression. The exhilaration with which you started has evaporated; the inspiration has oozed away. Yet what did you expect? The broad facts of American political development in the last half century are known to everyone. It is hopeless to imagine that in a horde of place-seeking, time-serving politicians you can discover any adumbration of the ideal Commonwealth.

Yet, back there at the other end of your short Odyssey, it did not seem so hopeless. After all, the Republic still lives, the oldest and strongest republic in the world. That tradition, that faith, may still have power to stir us. You see it now: we have walked in the wrong direction. We should have gone from the Capitol to the Memorial, and we should have marched all Congress with us. Let us try an experiment. Let us summon the Senate; let us summon the House of Representatives; and let us organize a crusade to the shrines of America. And let us call together all the bands there are in Washington, and go with drums beating and flags flying. And as we march along let us call to the Secretary of Agriculture and the Secretary of the Treasury and the Secretary of State, and let us send for the Postmaster-General and the Attorney-General, and for the Secretaries of War and Navy and Interior and Commerce and Labor and have them fall in with us. And let us seek the President, and press him to join us too. And massed at the foot of the Washington Monument let us doff our hats and repeat in unison:

"We have raised a standard to which the wise and honest can repair; and this standard shall be our standard."

And when we have come to the Lincoln Memorial let us kneel down and make a vow; let us here highly resolve no longer to smirch and disgrace the ideals we all inherit with our pettiness, malice and greed; and let us here dedicate ourselves to the task remaining before us, that of supplanting injustice with justice, and intolerance with tolerance, and hate with charity, to the end that civilization itself may not perish from the earth!

Higher Education Comes to Merchandising

Master of Science in Retailing Is the Latest University Degree

By J. OLIN HOWE

The metropolitan department store is the laboratory of those who take college courses in the science of merchandising.

COLLEGE training for the bargain-counter rush. Oh, not for the rushers. Theirs is footwork more than headwork and could best be trained for in a gymnasium or on the football field. But for the rushee, the man or girl behind the counter and the store executive, who do the thinking. And leading to a degree, Master of Science in Retailing.

This is no Alice in Wonderland fantasy, please note. Indeed, no. Far from it. It's plain business. It might even seem that linking up the university and the department store in such manner was the height of practicality in education—which is precisely what it is.

The store executive-to-be, who has put in his—or her, it matters not—three or four years at college or scientific school which complete the customary meed of higher education may now add to that an intensive two years in New York University's School of Retailing and acquire specialized knowledge of merchandising—get the very last word in how to run a retail shop, that is to say. Just as an embryo doctor or lawyer gains the special knowledge necessary to his line of work in medical or law school.

The first degrees of M.Sc.R. ever given went to the graduating class at the commencement of this school last June. The members of the class were graduates of colleges and universities in many parts of the country. More than half of them were women, but this is not true of the class which will graduate next June, and which is more than twice as large.

In each class there are a very few who are not college graduates—"persons of mature years who can satisfy the college entrance requirements and who have had business experience"—but these are not candidates for the degree.

There is even a night division, which takes as students those who have had a four-year course in a recognized high school or have the 72-count academic or commercial certificate of the New York board of regents which would show the equivalent of such high school course. And it, also, takes special students without these qualifications.

Its regular students gain a degree at the end of a four-year course—Bachelor of Commercial Science, B. C.Sc. It takes them twice as long to get it because theirs is undergraduate work, while that of the day division is graduate work. And to be permitted to write B.C.Sc. after their names they must satisfy the faculty that they have had at least three years' successful business experience while in the school. Their degrees are awarded by the University's school of commerce, incidentally.

"There is no contention," to quote the Bulletin of the School of Retailing (and this is the language of Dr. Norris A. Brisco, the live-wire Ph.D. from Iowa, who is its director and professor of merchandising). "There is no contention that it is possible to turn out a trained store executive, any more than it is possible for a law school to turn out an experienced lawyer or judge.

"It is nevertheless contended," he goes on, "that a grounding in the fundamental principles underlying retailing and their application will give young men and young women a vision and an analytical power that will enable them to grasp more quickly the problems which arise and make rapid progress possible."

School, Mornings; Store, Afternoons

THESE students spend their mornings getting the theory of retailing in lectures and gaining the book knowledge related to their work. But they spend their afternoons actually behind the counters of New York department stores. Behind the bargain counter, very likely, where there is much human nature to the cubic inch; or in the bundle wrapping room or out on a delivery truck. Or in the accounting or advertising or complaint departments.

Not as observers. No, no—as workers. Each must have had at least eight months of actual work in stores before he or she can gain the degree. And in the stores there isn't a thing in the world to differentiate the university student from any other clerk or cashier or bundle wrapper.

If you trade in New York's department stores, as many do who live elsewhere all the way from Bangor to San Diego, the chances are a hundred to one you have been waited on, mayhap even in buying a paper of pins, by a highbrow with letters after the name. There would be nothing whatever to indicate it to you.

We have been coming to this sort of thing for longer than one only casually acquainted with the situation might realize. For a number of years the New York City high schools have been training pupils in salesmanship and in what makes for efficiency behind the counter.

And this kind of practical education has been taken up by high schools in many other cities.

It started with the head of the personnel department in one of the largest retail establishments in the metropolis, who was responsible for various class work in his own store, who believed much time could be saved by applying high school work to everyday needs and who convinced the New York board of education he was right. An essential point in the scheme was that these high school students be given the opportunity for practical experience behind the counter.

One result has been a demand for teachers of salesmanship in American high schools. Several American colleges and universities have provided courses in which such teachers are trained. They have ceased to be a novelty.

But all such training really aims only at producing salesmen and saleswomen. To be sure, once they become that, they may grow competent to assume responsibility and graduate to executive positions. A good many have, in the aggregate. And there are big stores in New York and Chicago which have their own training classes for store executives, which have turned out many a successful department store head without advertising the fact.

One young man, the son of the owner of a large store in a midwestern city, was in the course of such training when he went home for the Christmas holidays. Next morning after his arrival his father called him before a gathering of the store personnel, exhibited an advertisement which would run in the next day's newspapers to the effect that his son was succeeding him in the management of the business and turned the place over to him.

Much Can Be Taught

"YOU'VE learned the business in New York," said the father. "Now go to it. Your mother and I are going to California."

Of course, it adds to the story to say that the son made a success of the job, but that happens to be true.

College training for store executives—managers of stores, heads of departments, all those who have the responsibility for successful conduct of the business—while having points of similarity with this other is, however, a distinct departure and altogether new. It is the logical outcome of present-day conditions, which demand not only that young men and young women be given a broad mental foundation for their life work but that they be shown how to turn this to account before they try to do it.

Yet what can a college teach about selling over the counter? Much. Ah, very much. In the thousands of years we humans have been trading with each other men have learned a vast lot about it and a deal of this is in books and in shape to be imparted to the coming generation. True, in 40 years of carrying on a retail business one could learn most of this, but to get it in a couple of years and have it ready for application from the beginning should certainly make for a greater measure of success.

The courses of the School of Retailing speak for themselves. As one might expect, its students learn the principles of retail salesmanship. These include the elements of and steps in a sale, creating good will, analysis of goods, use of motives and appeals, personality, types of customers, the question of price, and so on.

They study textiles and non-textiles, thoroughly and in detail. The four common textile fibers, wool, silk, cotton and linen, they take up in order—their spinning, weaving, knitting, netting, felting, dyeing and printing, with special attention to adulteration and substitution.

Products manufactured from non-textiles are gone into as carefully, the history of the material, its sources of supply, how it is handled and the uses of the finished article. Wood, paper, cellulose, coal-tar products, rubber, leather, ceramics, ferrous and non-ferrous metals and alloys are but some of these.

And then they go into ethics, how to "apply the principles of formal academic ethics to the practical problems of business," which isn't half as ponderous as it sounds. Co-operating retail merchants have furnished actual problems dealing with shoplifting, return of goods which have been used, spying on their stores, selling below cost to friends, false statements to customers, misleading facts in advertising, placing greater temptations before employes and the public than they can withstand, and so forth.

These students give time to color and design, too, and go exhaustively into the economics of retailing and into personnel relations. This last takes them somewhat into psychology, but they go into that more deeply. They have a particular course in the psychology of retailing, taught by the head of the university's psychology department. They learn, as well, how to make a variety of reports, how to gather, handle and present retail data.

All these subjects, and more, are in the regular curriculum of the school of retailing, and its students have the opportunity to take many a special course in subjects related to their work. They may take up accounting, advertising and marketing, general economics, finance, commercial law, French or Spanish, interior decoration, costume design or store display, if they wish. Or even general courses in trade and transportation, which include the technique of import and export trade.

Their store service is more interesting to the rest of us, naturally. Service fellowship is the phrase for that. Service fellowships are open only to students in the day division, who must spend half their time in the stores except in December, when they spend all their time there.

During the two years' course they are assured the opportunity to serve in at least four different stores. They are simply turned over to the stores to be placed wherever seems most advisable, but it is only natural that the student's own wish as to that should be given weight. And they are paid by the stores.

"Why not install wash basins in the haberdashery department and require clerks to wash their hands after each sale?" asked one of them of the store council in one of New York's largest stores. "I notice that many collars are smooched in the handling necessary to make sales and the cost of having these relaundered must come to a considerable item."

Not "Smooched," Now

OF LATE, men's collars are handled in tissue paper. That is the result of this suggestion. The solution was found, not in frequent ablutions, but in small sheets of tissue.

One Master of Science in Retailing of last June's commencement, a girl this time, reorganized the tube room of another great department store, the place where converge the pneumatic tubes through which cash carriers are hurled, just previous to the Christmas rush last year. She had studied the situation there from the time she entered the store and a suggestion she made showed such a grasp of it as to convince the manager he had found just the individual to do a piece of work he had had in mind.

Many of the school lecturers are drawn from executives of big stores in New York and Brooklyn and Newark. Most of these stores are represented on its advisory council, which includes, as well, high officials of the boards of education of these three places and the co-ordinator who has charge of placing high school students in stores on behalf of the board of education.

The theses the students have to turn in before they are eligible to the master's degree contain a wealth of their experiences in the stores. They see the real inside of department store mechanism, and they do a lot of good on their own account in the course of it. Their theses cover a wide range of subjects and one finds among them titles which arrest the attention—"Human Instincts in Retailing," "Good Will as Applied to Retailing," "Store Responsibility toward the Employe" and "Purchasing Power as the Guide in Buying."

There are 4.600 department stores in the United States and 1.250,000 persons are employed in them. Seven and a half billions of American dollars are invested in them. There is a single store in New York whose doors have been entered by more than 250,000 persons in one day and this store has made more than 700,000 sales in a week.

If such figures don't furnish sound reasons for higher education to give heed to merchandising, for the scientific training of those upon whose shoulders are to rest the responsibilities of a business of such magnitude and which so nearly concerns us all, what could? And more college graduates have been taken into the department stores of New York and vicinity in the last year than in the 10 years preceding it.

500 Years of Tapestries in One Exhibition

American Display of Extinct Art Held to Be Greatest Ever Made

By HARRY H. DUNN

ALTHOUGH the art of the making of tapestries is a child of Europe, where it occupied, in the sixteenth and seventeenth centuries, as high a place as painting ever did, it has remained for the United States to present the greatest, most comprehensive and most valuable exhibition of this master craft of the weaver ever assembled in the world. San Francisco, in the Palace of Fine Arts, on the grounds which once bore the Panama-Pacific Exposition, and under the management of J. Nilsen Laurvik, director of the San Francisco Museum of Art, this year gathered an historical exhibition of 80 tapestries covering chronologically tapestry-making in Europe.

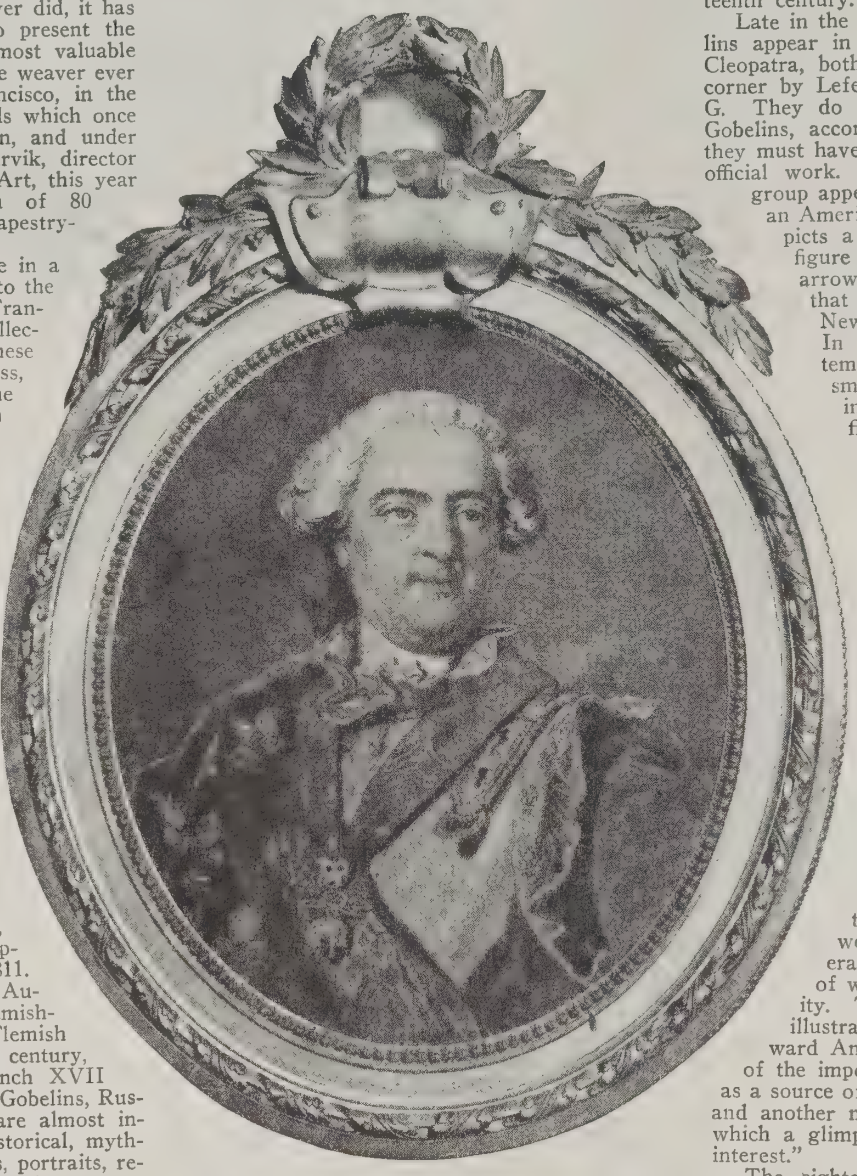
The tapestries, which were made in a period from the fourteenth century to the nineteenth, were brought to San Francisco from a score of private collections. Mr. Laurvik borrowed these tapestries, many virtually priceless, and all ranking in value with the greatest of the known paintings. In fact, for every genuine tapestry of authentic weave and origin now extant, there are a thousand good paintings, though tapestry, as an art, exists no more, largely because tapestries are very expensive to produce, and require a long time in the weaving. The art appears to have died more than 100 years ago, the last good tapestries having been made in Spain and Russia about 1810 to 1815.

The tapestries hung in this exhibition fill eight large rooms and one may follow easily the entire chronological record of tapestry-making from a huge Franco-Flemish piece, probably made at Arras, depicting the Annunciation, and dating from the end of the fourteenth century, down to a full-length tapestry portrait of Catherine the Great, woven at the Imperial Russian Tapestry Works, St. Petersburg, in 1811.

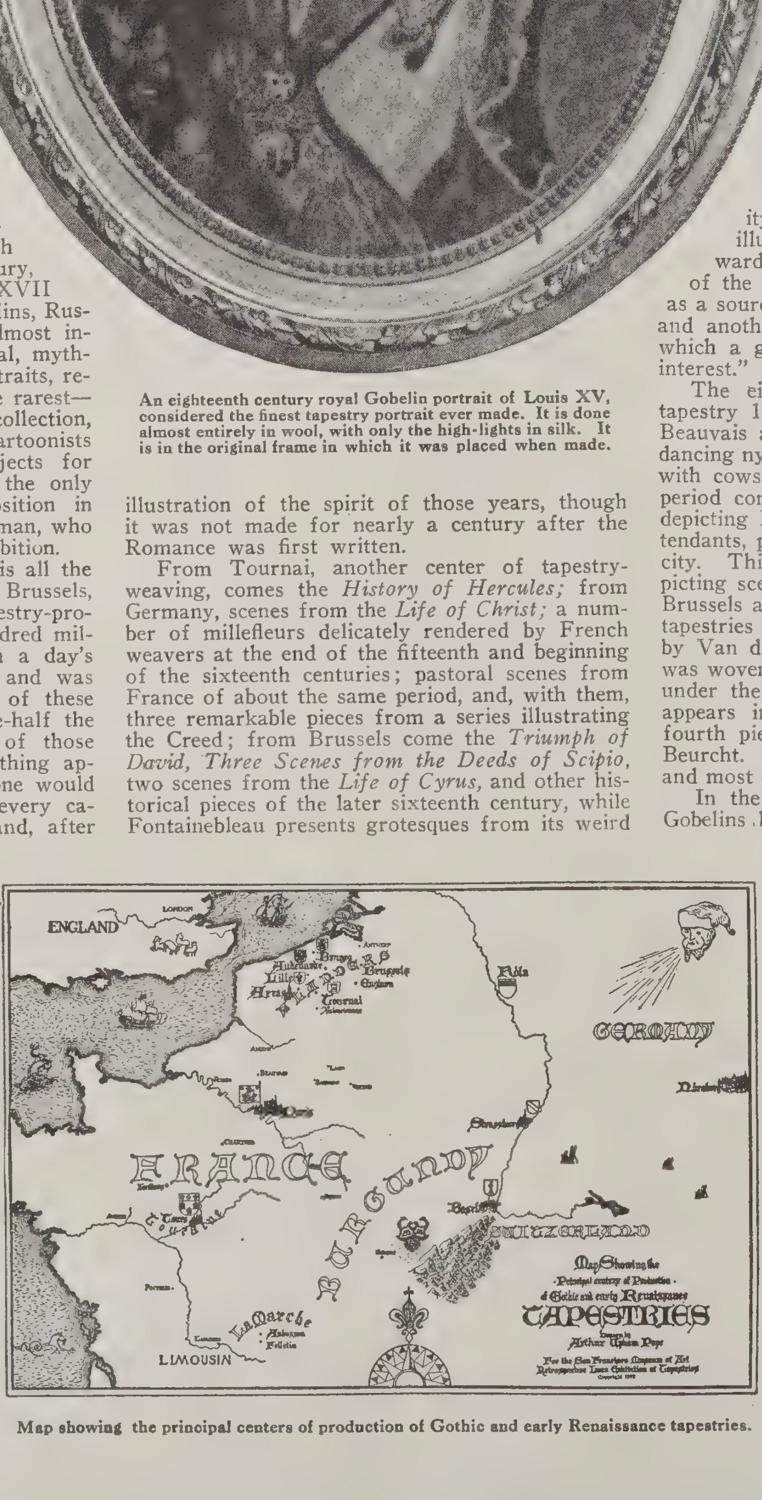
Fourteen looms are represented: Aubusson, Beauvais, English, Flemish-Gothic, Flemish-Renaissance, Flemish XVII century, Flemish XVIII century, Fontainebleau, French-Gothic, French XVII century, German and Swiss Gothic, Gobelins, Russian and Spanish. The subjects are almost innumerable, allegorical, classical, historical, mythological, armorial, genre, landscapes, portraits, religious, and even two still-life pieces, the rarest—though not the most valuable—in the collection, since few tapestry workers, either the cartoonists or the weavers, selected still-life subjects for their studies. In fact, these two are the only recorded examples of still-life composition in tapestry, according to Dr. Phyllis Ackerman, who prepared the catalog for the present exhibition.

This American exhibit of tapestries is all the more remarkable, when it is recalled that Brussels, situated in the very heart of the tapestry-producing region, with more than one hundred million dollars' worth of tapestries within a day's ride, attempted an exhibition in 1910, and was very proud of an exhibited collection of these products of the loom of less than one-half the size and one-fifth the historic value of those shown in San Francisco. To see anything approaching this San Francisco exhibit, one would have to tour all of Europe, visiting every cathedral, every museum, every palace, and, after that, every dealer's sales and show rooms in every large city on the Continent. In addition to the exhibition, lectures on the tapestries, the history of tapestry-making, the story of each tapestry, and something of the location of the principal products of this vanished art, were delivered each day in the exhibition rooms by Dr. Ackerman, who traveled from New York to San Francisco to talk to the people at this exhibit on these subjects.

The earlier figures from the Franco-Flemish school of the fourteenth and early fifteenth centuries, are notably religious in character. By the middle of the fifteenth century one comes on such gems as the *Scene from the Romance of the Rose*, the first part of which was written in 1337 by Guillaume de Lorris; the second part in 1378 by Jean de Meung, and both translated into English by Chaucer. Here a scene from this morality play in verse has been preserved in tapestry, virile, cruel, yet moralistic, a typical illustration of the spirit of those years, though it was not made for nearly a century after the Romance was first written.



An eighteenth century royal Gobelin portrait of Louis XV, considered the finest tapestry portrait ever made. It is done almost entirely in wool, with only the high-lights in silk. It is in the original frame in which it was placed when made.



Map showing the principal centers of production of Gothic and early Renaissance tapestries.

From Tournai, another center of tapestry-weaving, comes the *History of Hercules;* from Germany, scenes from the *Life of Christ;* a number of millefleurs delicately rendered by French weavers at the end of the fifteenth and beginning of the sixteenth centuries; pastoral scenes from France of about the same period, and, with them, three remarkable pieces from a series illustrating the Creed; from Brussels come the *Triumph of David, Three Scenes from the Deeds of Scipio*, two scenes from the *Life of Cyrus,* and other historical pieces of the later sixteenth century, while Fontainebleau presents grotesques from its weird designers and Paris offers one of the famous Artemis series, designed for Marie de Medici by Toussaint du Breuil, in the early part of the seventeenth century.

Late in the sixteenth century the Royal Gobelins appear in two scenes from the history of Cleopatra, both signed in the lower right-hand corner by Lefebre, with the fleur-de-lis and the G. They do not appear in the record of the Gobelins, according to Dr. Ackerman, and "so they must have been done by Lefebre outside his official work. In the late seventeenth century group appears one of the most interesting to an American of all the tapestries. This depicts a tropical landscape with a heroic figure of an Indian seated with bow and arrows, caressing an alligator—except that the cartoonist, unfamiliar with the New World saurian, drew a crocodile. In the background is a hill with a temple or mission surmounting it. Two small, nude Indian children are smoking pipes beside the large Indian figure. In the foreground is a heap of fruits and flowers symbolic of the wealth and productiveness of the newly discovered Americas. There is a border of fruits and flowers, with corner medallions representing the cardinal points of the compass. On the lower selvage is the Brussels city mark, and the signature "I. V. D. Beurcht."

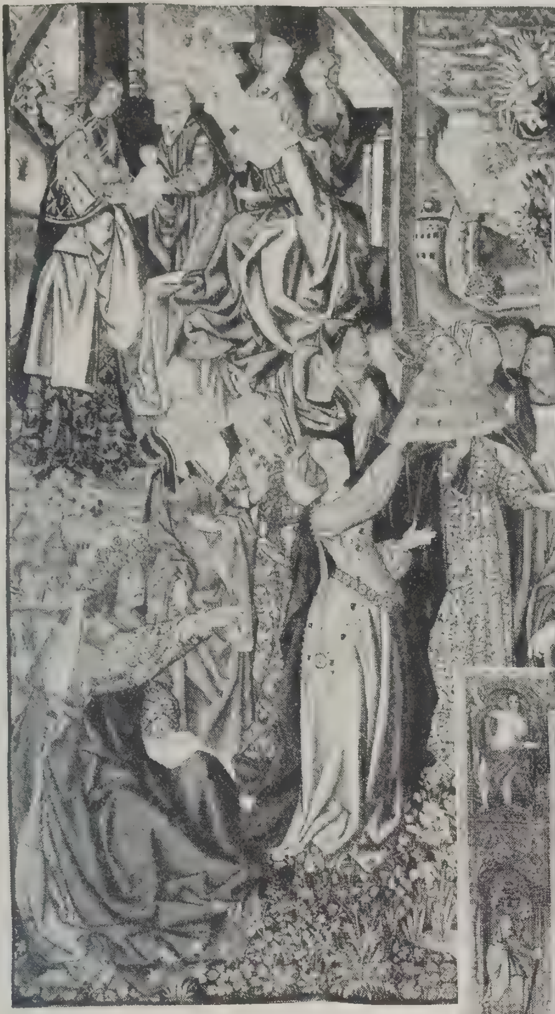
Regarding this interesting tapestry, Dr. Ackerman says:

"The piece is one of a set of four representing the four quarters of the globe. It was woven by Jean Van der Beurcht, one of the great weavers of Brussels, who is known to have been working between 1690 and 1710. The Van der Beurcht family for several generations had been painters, Jean being the first to turn to the profession of tapestry-weaving. He was followed by several other members of the family, all of whom did work of the highest quality. This particular piece is a splendid illustration of the romantic attitude toward America at the time, and a reminder of the importance America had to Europeans as a source of wealth. The 'mission' on the hill, and another mission settlement in the valley of which a glimpse can be caught, are of especial interest."

The eighteenth century is introduced by a tapestry 11 feet wide by 13 feet long, made in Beauvais and portraying a green landscape with dancing nymphs, and beyond them an open pasture with cows grazing. Also from Beauvais at this period comes a tapestry in wool, silk and gold, depicting Louis XIV on horseback, with two attendants, pointing with his cane to the siege of a city. This piece is one of a set of seven, depicting scenes in the life of this monarch. From Brussels at the same time is shown a set of four tapestries depicting the siege of Lille, designed by Van der Meulen for Lord Cobham. The set was woven in the Royal Manufactory at Brussels, under the direction of Leynier, whose signature appears in the border of three pieces; in the fourth piece is the Latin signature of Van der Beurcht. This is considered one of the strongest and most effective sets in the exhibition.

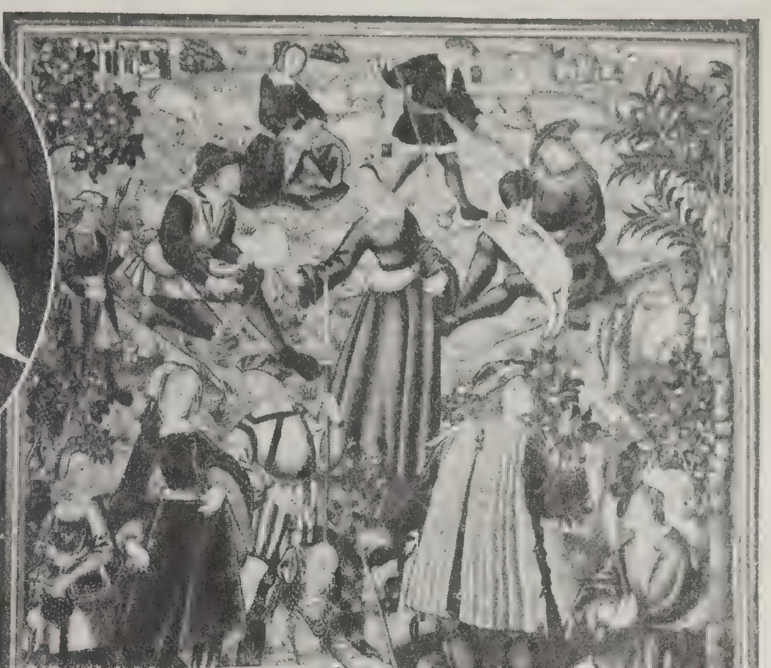
In the middle of the eighteenth century the Gobelins begin to appear in numbers, and there is an odd Chinese grotesque from Beauvais, designed by Berain and woven under the direction of Behagle. An illustration from "Don Quixote" forms the theme of a tapestry about 10 feet square, woven in the middle of the eighteenth century at Aubusson. It bears the signatures of M. R. D'Aubusson, director of the works; Mage, a tapestry merchant in Paris in 1746; and of Picon, a dyer to the king from 1748 to 1756. The scene depicted is that in which the priest and Cardenio meet Dorothy, with Don Quixote lying exhausted on the ground, while the faithful Sancho Panza pleads for his return to Toboso.

The latest productions of the tapestry looms are The Card Players, woven in Madrid at the end of the eighteenth century, one of the seldom-seen products of the Santa Barbara looms of Madrid, and an almost perfect imitation of a painting in the collection; and the portrait of Catherine the Great.

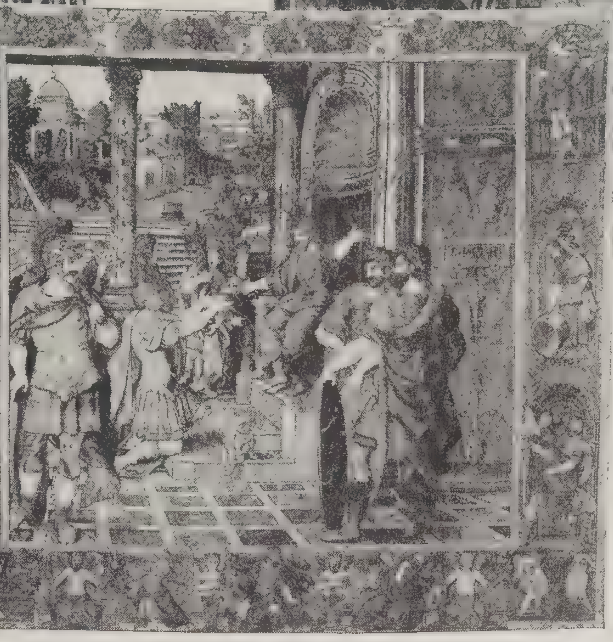


The Assumption of the Virgin, one of three huge pieces in a series illustrating the Creed. Evidently there was originally one more scene at the right of this tapestry which has been cut off, and the piece re-bordered. The weaving was done in Flanders, probably at Brussels, about 1510, from cartoons by Maitre Philippe, but the weaver himself is not known.

J. NILSEN LAURVIK, Director of the San Francisco Museum of Art.



Pastoral scene in France, in the late fifteenth century, an excellent example of the clarity of French design in tapestries of this period. This piece shows two ladies, with their lords, walking in the country, apparently on the way to a hunt, and stopping to speak to a group of peasants herding their flocks. The maker is believed to have been the same man who made the drawings for the stained-glass windows of St. Etienne du Mont, and of St. Germain-L'Auxerrois, but his name is not revealed.



Scene from The Deeds of Scipio, showing Scipio enthroned, offering the mural crown to Caius Laelius, and woven by Hubert de Mecht, from cartoons by Giulio Romano, in Brussels, in the second quarter of the sixteenth century. There are 18 pieces in this set, while two subsequent sets—the Triumphs of Scipio, and the Fruits of War—make a total of 35 pieces in the complete history, one of the largest sequences ever attempted in tapestry.

Ruthless Cutting Imperils Our American Holly

IN THE progress of the great conservation movement there is danger of entirely overlooking a very important member of our forest family—the American Holly.

Within the area of one of our large cities, there are perhaps hundreds of persons who have never seen the rolling swell of the sea, nor breathed in the fragrance of the magnolia, nor heard the silvery song of the wood thrush, but few indeed are unfamiliar with the holly and its sweet significance. Little children love it for its association with the annual visits of good old Santa; and in their later years, when contact with the seamy side of life has rubbed much of the bloom away none is too cynical to feel the charm of its symbolic beauty.

In the dim forest legends of Central and Northern Europe, the ruby holly berry is seen gleaming in the midst of pagan festivals. The holly branch was a token of good will between the tribes. When Christianity came to Europe, the holly tree took on a deeper significance at the Yuletide season. The day on which the Divine Babe was born became a festival of peace and good will. Because of its thorny leaves and warm, red berries, the holly tree was accepted as a symbol, and was displayed in Christian homes to denote the spirit of hospitality and charity that prevailed at Christmas time. Thus it became known as the Christ Thorn, or Holy Tree, which explains the origin of the name by which it is now known—Holly Tree. Among the brightest pages of English literature are those which tell of the Yuletide festivities in Merrie England, of revelry within the ancestral halls, and holly hanging high on the castle walls.

The actual baggage brought over by the hardy pioneers who colonized America was scant; not so, however, the precious burden of history, tradition and legend which generations had stored up. Familiar birds, animals and trees found in the new land were joyfully recognized and welcomed into the places once occupied by similar objects in the old home, and so it was that all the ties of sentiment and symbolism which the years had woven about the European Holly were transferred to its kinsman of the American forests. At this season no tree or shrub holds a warmer spot in the hearts of the American people than does the holly tree. The cheery holly wreath in the window or over the fireplace has become a necessary part of our Christmas atmosphere. If holly were missing a part of Christmas would seem to be gone.

Yet the utter extermination of the holly is only a matter of a few years, if the present rate of destruction continues.

The magnitude of the traffic in holly which has sprung up in recent times is difficult to imagine. Several weeks before Christmas, the holly cutters go out into the woods, armed with ax and saw. If only a few branches were judiciously pruned from each tree, very little harm would result; but financial gain, of course, is the only thing considered by most of those engaged in the holly traffic. The scarcer the holly, the higher the price obtained for it. No forest is distant enough to escape the pillage, and thousands of trees are cut down to the ground, stripped of their branches, and the trunks left to rot. The branches are shipped by the carload to the cities, where they are used as lavish decorations for large department stores, clubrooms and churches. In a few days the leaves wither, and the branches are taken down and piled together to be burned—a sacrificial bonfire to waste and thoughtlessness.

While it is the "holly business" that is rapidly bringing about the extinction of the Christmas symbol, Mr. Average Citizen must also bear a share of the blame. Going out after holly is one of the first and most delightful pleasures of the Christmas season in sections of the country where this beautiful evergreen is found. Before the automobile became common, the jaunt had to be made in the old-fashioned family surrey, with dependable old Dobbin furnishing the horse power. When the whole family was bundled in, little or no room was left, and so after one or two small sprays of holly had been gathered the return journey started, amid much excitement and merriment. But, as the popular song goes, those days are gone forever. Nowadays, everybody who has an automobile (and what is so rare as the man who has not one or two?) goes out and brings back as much holly as he can possibly pile onto his car. As a result, instead of the old-time holly wreath of greeting and good cheer, the home is filled with a profusion of boughs.

In the northern part of its range and along the Atlantic coast, the holly rarely reaches its maximum size, but down in the southern woodlands, where it thrives best, the growth and character of the holly tree is typical of our great nation. Springing up in the shadow of the aromatic pines and gnarled, moss-draped old oaks, it grows slowly but steadily until it reaches a height of 40 or 45 feet. Gay, erect, symmetrical, it is as handsome as a young monarch surrounded by his sage and bearded counselors. The noblest fairy prince that rode through the mystic lands of folklore and mythology could have been no more modest than is the holly tree when it opens its small white blossoms in response to the caressing warmth of the southern sun, nor bolder than when, in the midst of the winter's siege, it flaunts its radiant colors and steadfastly withstands the onslaughts of the blizzard. Many a feathered mite has partaken of its generous hospitality and returned the favor by carrying afar the seed.

Its comparative hardihood and outstanding beauty, at a time when nearly all other forms of floral life have bowed before the might of winter, make the holly ideal for ornamental planting.

Somewhat resembling ivory in color and texture, the wood of the holly tree is much sought after by the engraver and the interior decorator.

In the home it is a cherished friend, and witness of all the intimate activities that center about the hearth on the happiest holiday of the year. We should strive to preserve our native holly for all time as a treasured portion of our national heritage.

BRIEFLY TOLD

In addition to a prison sentence for speeders, a Detroit municipal judge has the violators taken through the children's ward of Receiving Hospital that they may see at close hand what suffering the speed craze has wrought. The judge also promises to take the speeders to the county morgue, there to view those who have been killed by reckless drivers.

President Harding broke White House records of several months standing when he shook hands with 1,450 persons in a recent reception.

"Please don't remove your hat in this elevator. Keep it on and help speed up elevator service." This is a sign the mayor of Cleveland proposes to place in all elevators in that city. "Fellows who have to be so polite and take off their hats just jam things up," said the mayor. "They hold their hats over their stomachs and take up room that other people should have and block the way in getting in and out of elevators."

Beavers of Alaska are felling telephone poles where the poles stand near the waterways. Several poles have been destroyed in this manner and the linemen protect the remaining poles by wrapping them with wire to a height of several feet.

The Chilean earthquake broke open an ancient graveyard, within 10 miles of Copiapo, which may reveal valuable data.

Among the most marvelous pieces of recent art is the new bronzo statue of Theodore Roosevelt unveiled in Portland, Oregon, a short time ago. The figure of the ex-President and his horse towers nearly 18 feet above the granite base and depicts the spirit of the West in a splendid manner. A. Phimister Proctor, a New York sculptor and friend of the former President, did the work.

Marion Talley, age 15, the daughter of a telegraph operator of the Missouri Pacific Railroad, is an American vocal prodigy, according to the decision of the directors of the Metropolitan Opera Company. She is to study for four years before attempting seriously to become a great artist.

When an American offered the Passion players of Oberammergau a million dollars for the privilege of filming the Passion Play without a change in cast, the players sacrificed their locks and saved their self-respect and honor. Owing to the depreciation of the mark, the temptation to violate a sacred tradition was great. Anton Lang's philosophy is that riches do not bring contentment and happiness, two assets the players now possess.

Fingerprints are now sent by radio by means of the Belin system.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

It is recorded that in the desert of Arabia north of Hail, in the foothills of the Skammar Mountains, in February, the thermometer fell from 78 degrees a little before sunset to 18 degrees a quarter of an hour after. Variations of from 30 to 40 degrees in an hour are not unusual.

Compulsory vaccination in Denver as a preventive of smallpox, was declared in effect recently. There have been 100 deaths from smallpox in Denver within a few weeks.

Whitehall Court, the home of the National Liberal Club, is 110 feet high, the highest building in London.

When Isadora Duncan danced in Indianapolis, Lew Shank, the mayor, stationed four policemen in the wings of the theater to see that the famous dancer appeared on the stage costumed according to Indianapolis standards.

A solid train of 14 cars of silk, valued at $5,000,000, recently made an unbroken trip from Seattle to New York.

Maxim silencers are not used on guns exclusively. They are used on gas and oil engine exhausts and suctions, air-compressor suctions, air hoists, air and steam discharges or safety valves, steam traps, and so on.

Depth bombs, exploded in Puget Sound near Tacoma, by Federal prohibition agents, thwarted expected attempts to recover from the water a large quantity of liquor which was recently thrown overboard by a smugglers' launch. The bombs were shot at the spot where the bottles were seen to sink.

White ants are destroying the beautiful old temples of Nikko, Japan. The temples, built of wood, sculptured and lacquered, are going fast under the attacks of the insects.

The German Government permits certain firms to print their own money in small denominations. During the reign of George III of England, the amount of copper coin in circulation was totally inadequate, and tradesmen of Great Britain issued tokens of their own. One manufacturer in Birmingham issued more than 9,000,000 pennies and the amount of "tokens" in circulation in 1780 outnumbered the genuine coinage.

Japanese water bags of rice paper are more durable than similar articles of rubber. Resin is used between the layers of paper, which is soft and flexible. The outside is covered with lacquer.

Calvin Coolidge says: "In these days, children get about what they ask for, not what the wise judgment of their parents should dictate. Their pockets are filled with money and out they go to purchase pleasure, all the pleasure their easy money will buy. The taste for pleasure is formed as the taste for thrift and work is killed. Later on, in a natural development of things, the taste for pleasure becomes so strong that it must be satisfied at any cost. If crime has to be resorted to, that price is paid."

A speed of 1,200 miles an hour will be entirely possible in aircraft within the next 25 years, according to Professor F. W. Pawlowski, of the aeronautical engineering department of the University of Michigan.

There are enough motor vehicles in the United States to take the entire population for a ride at one time.

A tourist in passing through four states recently was required to purchase four different sets of lenses that his headlights would comply with state laws. Uniformity in highway regulation is needed.

Zebras are to be bred on a farm near Millbrook, New York.

Colorado has a silver highway. The material of the highway from Durango to Silverton was taken from the dump piles of abandoned silver mines. The hard surface of the highway contains an appreciable amount of silver in its native state.

The German landlord of the Rumanian Embassy in Berlin bricked up the door and stood outside to tell the tenants they could not enter until six months' rental in arrears had been paid.

CHRONICLER OF THE NEGLECTED TRUTH

Swindles of the "Musical Moonshiners"

How Fake Song Promoters Mislead Amateur Writers and Steal More Than a Million Dollars Annually

By WILL G. CALDWELL

CONSERVATIVE estimates, based upon records of copyrights granted, indicate that at least a million dollars a year is being obtained under false pretenses by what the legitimate music publishers call "musical moonshiners."

Perhaps you have seen advertisements offering to write music for and publish song-poems. Usually the advertisements read something like this:

> "Write the words for a song. We will compose music, secure copyright, and publish. Submit poems on any subject today."

Thousands of these advertisements have been published, many in reputable publications. As proof that they have brought tremendous returns we have but to consult the records of copyrights granted. The 16 leading music publishers of unquestioned reliability filed in 1920 but 2,669 copyrights for songs, yet there were more than 31,000 song-copyrights granted in that year. A check-up of three of the leading "musical moonshiners" shows that they filed 7,794 copyrights in the same period, proving beyond a doubt that the song-writing swindle has assumed the proportions of a real industry as far as volume of business is concerned.

The records of copyrights do not indicate the full extent of the scheme, for many of these "musical moonshiners" do not even trouble to copyright the pitiful compositions submitted by their victims. One promoter who recently fell afoul the Federal authorities is said to have profited to the extent of nearly one million dollars in three years as a result of his activities in inducing credulous persons to pay him for having a few copies of their song-poems printed.

Differing only in details, most of the schemes worked by these fake promoters are surprisingly alike. To anyone familiar with the mechanics of music publishing their promises mean nothing, but to the average uninformed and perhaps illiterate victim they appear to be a heaven-sent opportunity to become rich and famous overnight.

It goes without saying that the average person who thinks he can write an acceptable song-poem without any experience or previous training in the business is credulous to say the least—usually ignorant or illiterate would better describe him. But be that as it may, the fact remains that there are thousands of people—mostly romantic-minded women—who are convinced that the poem they have written is another "After the Ball," "Silver Threads," or "Alexander's Ragtime Band." Most of the compositions offered are of the ballad type, although no type of song is slighted, there being every sort of poem offered, from the coon-shouting jazz number to the most pitiful attempts to imitate the favorite sentimental ballads.

The "Come-on" Literature

WHEN one of these earnest but misguided persons answers one of the advertisements, similar to the one quoted in the second paragraph of this article, a circular is sent him or her by the fake promoter. Usually this circular tells of the wonderful and fabulous sums that have been earned by certain popular songs, known to almost everyone. One circular before me tells how George M. Cohan was paid $25,000 for "Over There," and how another song called "Bubbles" brought $15,000 cash to the author. Page after page is devoted to making the prospective victim believe that there is a great shortage of songs, and that almost any old song-poem published will sell rapidly and pile up a fortune in royalties for the author.

In one circular we find the following glittering promises of rewards to the song writer: "No field of literature offers the possibility of reward for the amount of effort expended that song writing holds. Every day you hear a new song being whistled, played and sung. As each sweeps across the country thousands of copies are sold and material reward in the form of large royalties checks is going to some author." With this, and a vast amount of similar "come-on" talk, the amateur song writer feels that his or her song is bound to make a fortune. Reading the proposition offered by the "musical moonshiners" they are convinced that their song only has to be printed to achieve success.

The proposition offered by these fake song promoters is, to the amateur, remarkably liberal and fair. To those who know, it is nothing more than a downright swindle, at times common ordinary robbery, protected by the ignorance of the victim, and technicalities of wording never understood by the victim. Although many of these fake promoters have been put out of business by the postal authorities they usually so word their contracts that they can prove that they have done everything agreed to, and thus elude the law.

What is this wonderful proposition they offer? Briefly, it is to compose the music for the song-poem submitted by the victim, copyright and print a certain number of copies of the completed song, submit it to all the leading publishers, music dealers, and make an effort to sell the songs to the leading stores and chains of stores operating music departments. More than that, they agree to place copies of the music in the hands of all the leading singers in vaudeville, on the musical comedy stage, and with bands, orchestras and the various manufacturers of music rolls for the mechanical pianos, as well as the manufacturers of talking machine and phonograph records.

All these valuable services will be rendered for the small sums of $25 to $90. If the victim fails to respond to the first letter, a vigorous follow-up system of mailing is begun, each successive letter or circular making some sort of concession in price, or a "SPECIAL INTRODUCTORY OFFER," ostensibly good only for a few days.

To paraphrase a leading cartoonist, all these promises of services to be rendered "don't mean anything," even though they are carried out to the letter. Let us consider each promise and see how it is disposed of.

The Music Publishers' Protective Association has issued a bulletin which says, "any hack musician of experience can grind out commonplace music by the yard. With song texts set before him on the piano rack, and plenty of music paper he will wearily work all day on one or two formulas, till sick of them, then use another, always basing his scheme on the popular music of the hour. This heartless mechanical piffle is what these 'set-your-poem-to-music' grinders sell at a good profit to their ignorant victims. We have positive evidence of the same music being sent to different victims in different states at the same time."

"Composed" 1,948 "Songs" in Year

THE same bulletin is authority for the statement that a certain New York faker entered his own name in the copyright records at Washington as composer of 1,948 songs in 1920. Think of it—more than six songs a day for every working day in the year. When we consider that two or three hits a year is the record for even the most prolific of our most famous writers of popular songs we have to hand it to this gentleman for industry, if not for honesty, and for quantity, if not for quality.

Now that gives us an idea of the sort of music we can expect our amateur song writer to get from these fakers. The next promise is that the words and music will be printed, that an attractive pictorial cover will be designed and printed in colors for the song. It costs but a few dollars to have any music printer set up the words and music for a song and run off, say 200 copies, which is the number called for in the average contract. The covers are simply printed from stock plates, with a space left blank for the title of each new victim's song to be printed in. Hundreds of songs are sent out each year, all having the same cover page, except for the small space at the top where the different titles are printed in.

When the amateur receives his consignment of copies of his song, with the flashy cover, and his name in large type as author, he gets a thrill that is, to him, perhaps, worth the money he sent the grafter to print the song, after "setting it to music," but the vicious part of the whole scheme is the fact that few of the victims have the money to spare. Most of them are in moderate circumstances—many of them borrow the required $25 to $100 which they send to the fakers. When their song is received they are led to believe that its chances for success are almost assured. One of these fake promoters has a whole series of letters—form letters, printed in quantities—designed to work the victim's enthusiasm up to a white heat. When the printed songs are sent, a letter is also mailed, stating that a "certain nationally known publisher has expressed interest in the song and that negotiations may be completed at any moment." In the meantime, the victim is given to believe that the faker is making prodigious efforts in behalf of the song.

He is often led to believe that the song will be submitted to all the leading publishers of popular music. As a matter of fact it has been proved that the only method used to submit these songs to the publishers is that the fakers usually—to protect themselves in case of investigation—mail a copy of the song to the leading publishers. They receive no consideration whatever in the offices of these publishers. Perhaps a few copies of the songs are mailed to certain stage-folk, who, of course, never consider them.

An Expensive Undertaking

PUBLISHING and popularizing a song is an expensive and difficult undertaking, and to think that these "musical moonshiners" lead their victims to believe that their pitiful attempts at song writing can hope to meet with success is almost as amusing as it is regrettable.

Investigation shows that the average legitimate music publisher is not interested at all in the efforts of amateurs. Usually he has a staff of skilled and experienced song writers who are familiar with the situation from all angles, who, in collaboration with experienced musicians, are constantly working to turn out a song that will sell. One of the leading publishers of popular songs frankly states that all unsolicited manuscripts are returned unread. Then what chance have these effusions of amateurs in competition with the combined efforts of famous writers, noted musicians, and experienced publishers and their staffs of skilled promotion men? None whatever.

It may be said that any publisher who demands a payment for the publication of any song is either operating a fraudulent scheme or not dealing fair and square. Do not confuse "publishing" with "printing." There are many legitimate concerns in the music printing business who will, for a sum, print your song, from music furnished, but "printing" and "publishing" are entirely different activities. It is entirely legitimate for any printer to print a song—just as much so as it is for him to print a calling card—but these firms who offer to compose music, print, and publish your song-poems, and submit them to the stores, musical organizations, and talking machine record companies are downright frauds, for their business success is founded solely on their ability to make you think they are rendering a service of value, whereas their services are totally without value. Their whole scheme is first to make you believe that your poem has merit, second that the music they compose is of value, third that their efforts (?) in marketing the completed poem are of value, and fourth that they will actually make any determined effort to sell the song when printed.

One investigator composed a poem that was actually as silly and pathetically sentimental as he could make it. This was submitted to one of these musical moonshiners who promptly wrote back that the poem seemed to have genuine merit, and that it held great promise of becoming the rage of the hour if set to appropriate music, and "published." He actually said published, but he should have said "printed." His price was $65 for which he offered to criticize, write music for, publish 600 copies, copyright, and promote the song when completed. His "promotion" (?) services were to comprise the following activities:

Two hundred copies to be sent to the author for his or her own use.

Two hundred copies to be mailed to 200 performers and theaters located outside of New York City.

Eighty copies to be submitted to 80 different music publishers.

Copies also to be mailed to leading manufacturers of phonograph records and music rolls, and the balance of the copies to be filed in the professional department for use in the permanent demonstrating portfolio.

This faker also agreed to advertise regularly in theatrical papers inviting professionals to call and hear the various songs demonstrated. In this connection it may be said that even the mediocre members of the profession who sing songs in their acts are literally hounded by the agents of music publishers in their effort to place their songs. "Song pluggers," as they are called, are sent to sing even the successful songs in theaters, dance halls, music stores, department stores, and public gatherings of all kinds. Even though half a million copies of a song are sold the publishers stand to lose money on them, due to the enormous expense of promotion, advertising, and "plugging." What, then, can the amateur hope to achieve with the paltry hundred he or she hands over to a fake?

"Royalty" Check for Nine Cents

ONE of these "musical moonshiners" had an ingenious scheme—so ingenious that it attracted the attention of the Postal Inspectors who issued a fraud order against him—for pacifying his victims. He had printed, in large quantities, checks for nine cents. These checks were supposed to represent the month's royalty—three cents a copy on three copies. A letter was sent stating that the music business was temporarily very dull, and that the song was seemingly not in demand "at present." The faker generously offered to donate to the victim the printing plates used in printing the song. Usually the amateur, having visions of popularizing his own song, through his own efforts, accepted the offer and wrote for the plates. In signing a receipt for the plates the victim virtually signed a release, absolving the faker from all responsibility.

In the governmental investigation it was shown that every victim received the nine-cent checks, proving beyond a doubt that none of the songs ever sold, for the three copies which were supposed to have been sold, were never sold at all.

Here is the warning sent out by the legitimate publishers of music to all amateur writers.

1. Anything can be set to music of some sort from the cheapest jingle to the most wonderful poem.
2. Music written to order is, as a rule, valueless, and is rarely, if ever, actually published.
3. Professional copies, so-called, are worthless to the legitimate publisher, and promptly go into the waste basket.
4. Printing is not publishing.
5. No high-class, genuine music publisher takes orders for publishing. They only accept music they are willing to invest in, they themselves assuming all the risk and expense of publishing, besides paying the composer for his work, whether in cash or royalities.

There are literally thousands of persons who are laboring under a delusion that they have ability to write songs or song-poems. Any reader who knows one will do him a favor to explain the workings of the hundreds of shyster firms that operate. If the amateur writer simply must submit his or her poem to some one, it is not necessary to have it printed, or even copyrighted. Simply go to any music store and obtain the names of the publishers from the copies of music on sale. If your poem really has merit—chances are it has none—there is perhaps a remote chance that it will happen to be accepted, but the chances are remote indeed; just as remote as it is for an amateur baseball player to jump from the sand lots direct to the big leagues.

Rocking-horse Passing as Home Shrinks

Germany Stages Come-back in American Toy Market

Wouldn't Johnny like to get in here?

By E. I. FARRINGTON

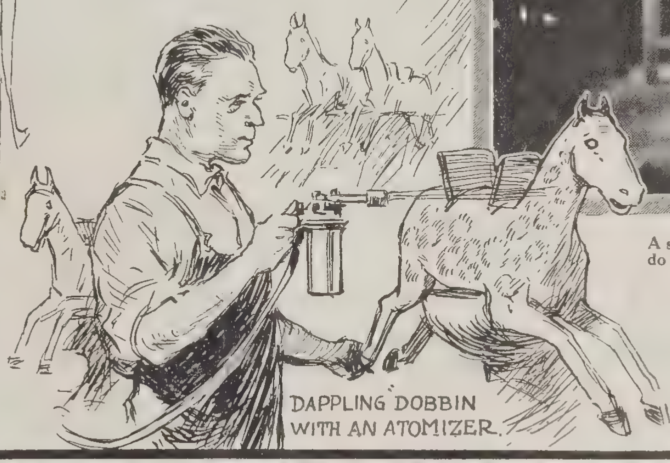
TOONERVILLE TROLLEYS made in Germany! Sounds rather anomalous, even though they are toys, for the Toonerville Trolley is distinctly an American institution. Yet it is an indication of the effort being made by Germany to regain its old-time ascendency in the toy business. The Germans are making toys cheap, far cheaper than they can be made in this country. The Toonerville Trolley car, which is a most amusing miniature of the antiquated vehicle seen in the newspaper cartoons and in the movies, having the same limp, and the same bewhiskered motorman, was invented by an American, who gave the Germans the job of manufacturing the toy because they could make it to sell for a dollar.

American manufacturers had an opportunity to take the toy market away from the Germans as a result of the war. They failed to do it, either from disinclination or because they did not look far enough ahead. So now conditions are gradually taking the same shape as before the great conflict, only that the German factories cannot fill the demands of American dealers.

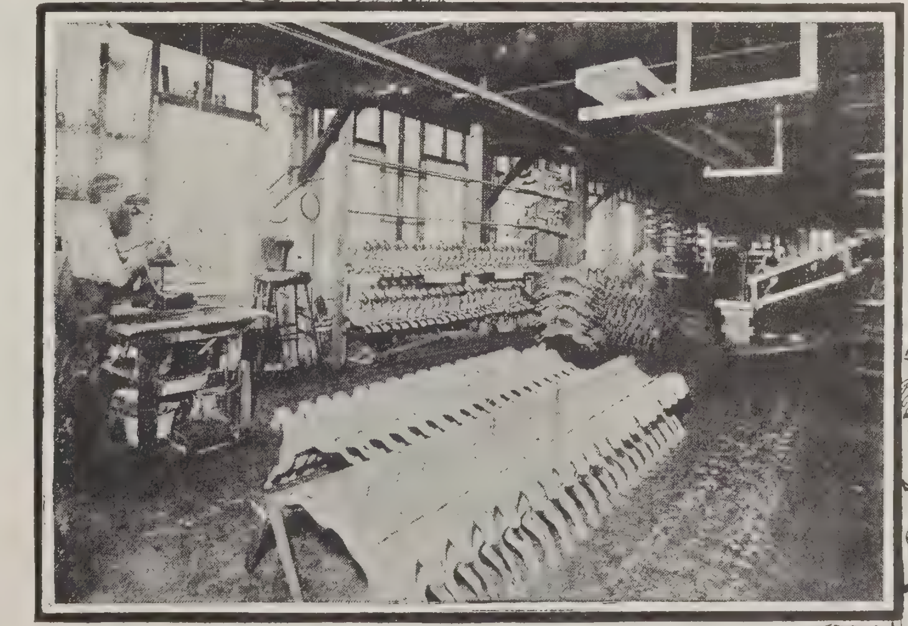
Dolls must always take first place in the toy industry. Five dolls are sold to one toy of any other kind. And the doll with the bisque head is now, as it has been for years, the favorite doll of little girls and their mothers—and it may be said in passing that the mothers seem to get quite as much pleasure out of shopping for dolls as do their daughters. Practically all the dolls with bisque heads come from Germany. American toy makers had five or six years in which to learn the art and develop the process, but they didn't do it. They preferred sticking to the composition doll heads, which they can make and sell at a lower price.

There never was any real competition between American and German toy makers, and apparently the business is getting back on its old-time basis, the Americans having passed up the opportunity to beat the Germans in their own lines. The American factories turn out composition dolls and the German factories bisque dolls. The Germans make cheap mechanical toys and the Americans mechanical toys which are relatively expensive. There is no great rivalry here, except that the cheapness of the German product cuts down the demand for domestic goods.

A smart factory owner would get all the little girls in town to come and do the job for nothing. As it is, he'll pay to have their clothes put on.



War memories fade quickly when business gets into the saddle. I myself wrote only a few years back that Germany had lost its toy business for all time in America, at least; and the toy makers approved. Now the toy buyers of the United States are grabbing up all the German toys on which they can get their hands and grieving that there are no more. It is just business. The successful buyer goes where he can get the best bargains. To be sure, the new tariff makes a difference, but a large proportion of this season's toys were in before the tariff went into effect. The increase is considerable. The rate before was 35 per cent. Now it is 70 per cent. Before the first of August a dollar toy cost $1.35. Now it costs $1.70. This will make a difference in next season's profits. As far as the German toy maker is concerned, however, the question is, "Will there be any next season?" The constant decline of the mark is gradually putting him out of business. The sum which paid last season for the material from which his toys were made, will not nearly pay for the same amount of material this season.



A corner in the rocking-horse room.

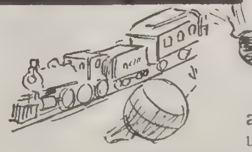
Toy factories in this country have been running at full blast this year at a time when they would like to see their orders pretty well filled. That is because the retailers refused to buy in the spring, as is the normal custom. They were waiting for prices to drop. The manufacturers said prices couldn't be dropped. The buyers shrugged their shoulders and continued to wait, or else sent their orders across the water. Yet the domestic factories are having a good season. In former times nearly $9,000,000 worth of toys came to this country from Germany. This year imports are probably not one-third of that amount. And people will buy toys, even though they cannot pay their house rent. At the same time buying is not what it was just after the war. In 1919 the workers of the country were having an orgy of spending and that year saw the peak of the toy trade.

It is in the making of wooden toys that the American factories enjoy the greatest supremacy. The number of these toys turned out is almost beyond belief. A big pine tree lasts only an hour when it gets into one of the toy factories, and then, presto, it appears in the form of rocking-horses, dolls' furniture and playhouses, enough to fill a room.

Rocking-horses were once among the most important of all toys, and still sell well, but in greatly lessened numbers, owing to the modern custom of living in tiny apartments, where a real boy's size rocking-horse would occupy the space required for something much more utilitarian. Rocking-horses are now for the farm house and the suburban home.

There is a town in Northern Massachusetts commonly called Toy Town, because toy making is the chief industry of its 6,000 inhabitants. It appears on the map as Winchendon and it is recognized as the train passes by a huge rocking-horse 17 feet high, standing beside the tracks. A large proportion of the rocking-horses sold throughout the country come from this town. Enormous quantities of lumber are used to produce them, while butchers far and wide are looked to for cowhides to cover the bodies and for cow tails to make the waving manes. Rocking-horses, like most other wooden toys, are practically machine made. A block of wood is fed to the machine, the power is turned on and sharp knives carve the wood into the exact shape of a wooden model at the other end of the machine, over which little mechanical fingers move as though guided by a human brain. The operator simply takes off the finished body and puts on a new block of wood. The legs and head are fashioned in much the same way, but the shaping of the nostrils has to be done by hand as no machine has been invented which will perform this delicate piece of work.

The painting is done by dipping the horses into a great vat of thin color, after which the wooden animals are stood upon racks to dry. The dapple gray, which color seems to be preferred for all wooden horses, is obtained by means of an air pump which sprays liquid lamp black over the white paint. The glossy coats are produced by the free use of varnish.



The cowhide coverings are reserved for the higher priced horses, while there is an intermediate grade on which plush is used. The eyes of the most expensive animals are made of glass, and are slipped into little sockets cut to receive them. Most of the horses boast handsome saddles and bridles and sometimes whole battalions of gayly caparizoned horses are to be seen lined up on the factory floor as though only awaiting riders before starting for the front. The rockers are put on last of all and are made of carefully selected wood shaped in steam ovens, for it is on the rockers that the greatest strain is bound to come. As made today, American rocking-horses are the best in the world.

One big concern has come out with dolls entirely of wood. Of course, these dolls are indestructible, but in addition they have jointed arms and legs and are made up with carefully designed faces.

Christmas, 1922

IT IS the fifth Christmas since the Armistice. It comes upon the world without the world's consent, perhaps against the larger part of the world's desire, but still it comes without asking leave. It comes because it celebrates something that began once upon a time and is yet to be completed in the fullness of the times. Christmas is not traditional, it is prophetic. Historically, it is probably true that Christmas is not the natal day of Christ; as nearly as that event can be fixed it fell in our September; but as September is nine months after the Christmas season, the event that befell on Christmas was more mystical than the birth of a child. It was never claimed for Christ that His birth of a woman was the unique fact of His coming, but that He was divinely conceived. So that Christmas as a natal day may pass, but as a time more significant still, it remains. Its virility against the paganism that would rob it of its essential meaning is worth thinking about.

Christmas comes in times of war as in peace, in times of plenty and in times of need. When it comes in troubled times, it points the world beyond the troubles. And when it comes in times when the more obvious troubles have ceased, it leaves men restless that they have come so short a distance on the way. Christmas had a much different aspect in war times than it has now; we were unfeignedly glad to see it then; it represented in our minds the Armistice of God. But now, it chides and challenges us, our "peace" is so little like the Christmas peace.

Christmas contains the formula of peace. "And suddenly there was with the angel a multitude of the heavenly soldiers chanting, Glory to God in the Highest, and on earth peace to men of good will." The world talks about peace; propagandists weary us by their propaganda against war when they ought to know we do not want war. But with all our talk about peace we still cling in our social and economic systems to those things which produce war. War is not produced by soldiers, but by economists and philosophers. War is the explosion of wrong thought. As high explosives are made silently in the laboratory of the chemist, so is war produced by national thinking in time of peace. The angelic formula of peace takes care of that. When the divine purpose and will are set in the highest place, when it is shadowed forth in common good will among men, then there is peace. Good will is the only good thing we can attain. Will is not will, unless it be good; it is not will unless it be strong. The angels who sang were not lily-fingered choir boys let out of heaven for an hour—they were "multitudes of the heavenly soldiers, singing, Peace!"

A Third Party

IT IS interesting to follow the efforts of publicists to reach a conclusion about this third party business. Every one seems to be saying that a third party will have no chance, but they say it with the air of men who are anxiously peering to see if the third party is coming round the corner. Politicians are saying that a third party is impossible, even while they eagerly ask for news of the third party movement. The only possible conclusion at present is that the political sharps know nothing about it.

In the absence of knowledge, the politicians have therefore set out to decide upon a policy with regard to the nonexistent, impossible third party. Here, unfortunately, the same lack of unity and wisdom are apparent. There are two policies: one is to encourage the third party movement—that is, get all the "nuts" and their candidates into one bloc, and then gently but firmly sweep them all into the discard. This is the astute policy of certain gentlemen who always place their bets on the trick stunts in politics. The disadvantage of this stunt is that it has been worked before, and like "old stuff" it may not work this time. The last time the third party movement became a menace to the organized scoundrelism which we know as politics, it was deliberately fostered by the politicians. It was encouraged. It was brought to its fullest strength. And then it was wrecked. It was wrecked in a way that honest people cannot understand. The stand pat conservative money powers handed out orders to certain sections of the red rampant radicals, and the thing was done. Honest people never can get that coalition through their heads. They think that the conservative money powers and the red radicals must be enemies—they simply must be enemies. But they are not. Russia was financed by International Financiers. They work hand in hand with the revolutionaries. The two ends of society (as most people conceive them) are really joined in one purpose. They are both destructive. These gentlemen would like well enough to see a third party, because they think they know how it could be prevented from accomplishing anything.

Then, again, there are politicians who desire a third party, that the two old parties may be cleared of the progressive elements which are now uncomfortably apparent among them. Democrats who think and Republicans who think are mighty inconvenient passengers on the party ship. If they could be lightered off on a third party, the blustering of brutal captains and the errors of ignorant mates might be continued in peace a little longer.

That fairly represents one of the policies which have resulted from the politicians' attempt to read the signs of these politically bewildering times.

The other policy represents a higher quality of political wisdom: it is a policy which stands out against third partyism as the most dangerous thing that could be encouraged. A considerable number of serious politicians are frightened at the possibility of a discontented populace flowing into any voting bloc that offers. These politicians do not utter so glibly the stock trick about "organizing them by themselves and then bumping them off." They have visions of nothing being left of the older organizations, should once a third party movement be launched, except those elements that have not yet discovered that the Civil War is over.

In the midst of it all, nothing is being done within the parties to clean up. It is a safe guess that there never was a third party program that did not have as its original purpose the cleaning up of the two older parties. Third parties are made up of the decent elements of older parties. And if it shall occur that these decent elements prefer to stay within their party lines to clean up inside, all the better—two parties are saved, and there is much less clutter in the political field.

A safe principle to remember is this: parties that spring out of candidacies instead of out of issues, die aborning. The last conspicuous example of this was Roosevelt's attempt to organize a party around his personality. Candidates are important only as they incarnate issues. That is the importance of parties, too. If the two old parties stood for anything definite, that would be a most important novelty in recent political life. Apparently they stand only for office. The next election will be controlled by issues, and not by candidates or parties.

Everybody Pays

SHELBY M. CULLOM, when he was a power in the United States Senate, once became suddenly—or perhaps inadvertently—candid. He declared himself opposed to a Federal income tax because of its great revenue-producing capacity. It knocked one argumentative prop out from under his advocacy of a high protective tariff.

Today we have the Federal income tax, a high protective tariff *and an inadequate revenue.*

Nor do we foresee the end either of oppressive taxation or of the necessity of an increased Federal income.

Whether this burden is shifted or not everybody pays. If the surtaxes are not reduced the prices of commodities rise to meet the tax and the cost of its collection—and the cost of collection is very liberally estimated in fixing selling prices.

This, however, is incidental. The crux of the situation is that we are paying for our war and will go on paying for years to come. We don't pay equally or equitably. The unorganized mass of consumers foot the final bill.

A nation which a generation ago had open to it a choice of methods by which to raise revenue for its government today finds itself at least seemingly unable to eke out enough from *all of them* without "oppressing the public" on one hand or "paralyzing industry" on the other. And the country goes on as calmly as if the great day of reckoning did not steadily approach.

Daugherty's Concealed Enemies

THIS paper has been plain in its discussion of the case of Attorney-General Daugherty, but it does not propose to be fanatical regarding him. It does not propose to exalt him to the dignity of a national sacrifice which, if obtained, will augur national well-being ever after. Nor does it intend to be drawn into the hue and cry, as some others are, to such an extent as to forget to scrutinize some of the enemies of the Attorney-General.

What THE DEARBORN INDEPENDENT is striving to do is to prevent landsliding the American Mind on any issue. It has an ideal of the American People standing calmly with all the facts—*all the facts*—in hand, and giving judgment without passion. This is the direct opposite of what is sought by most of the propaganda now operating. The people are not given *all the facts,* most of the propagandists themselves could not stand an examination on the most elementary of the facts—to appeal to American intelligence is too hard a job for the hired press agents of the persecution; to appeal to prejudice is too easy. It is dangerous to appeal to prejudice, besides risking a reaction which sometimes achieves the opposite objective.

It is only too plain that certain public scavengers are jumping into the Daugherty case to obtain for themselves the doubtful glory which will be theirs if they can grab off a little of the credit for his downfall—supposing that he should fall. There comes a time when a minor justice is satisfied by rebuking these loudly self-appointed stewards of justice and by refusing to work with them. Or better, perhaps, by proposing that some of them be investigated, too. The spectacle of that inveterate and parasitic publicity glutton, Sam Untermeyer, pushing himself in to assist at the judgment of an American Cabinet Officer, is a little too strong even for stomachs habituated to the actions of the International Financiers and their lawyer subordinates.

We get glimpses of the fray, now and then, which reveal that, of the two groups, Daugherty's and his assailants', Daugherty is the whiter man. A horrible spectacle of alien impudence is being made in some parts of the case, and it is to be hoped that those in charge will rebuke it.

This is no whitewash for Daugherty. If there is anything for him to answer, he ought to answer. It is only fair to say that he has never refused to answer. The fact that he could not be frightened to retire under fire, is indicative perhaps of a much more complete answer.

What THE DEARBORN INDEPENDENT knows is this: Daugherty's case might not have commanded the adverse attention of the International Financiers if he had been less faithful to the interests of the United States in certain matters that have deeply touched the Internationalists.

Clemenceau's Tour Has Failed

IF IT IS not impolite to say so, Georges Clemenceau's trip to the United States has not been the success that he hoped. He has been received with the honors and the cordiality befitting a distinguished representative of France and our former ally. His picturesque personality would have won for him an interested hearing even if the years of war had not heaped official dignity upon him. And now that his errand is fully known, the personal kindness still continues, but he will not get what he asks.

M. Clemenceau appears to have prepared for this trip with considerable care. He has apparently studied the strong and the weak points of all the official and unofficial ambassadors from the other nations which had preceded him to these shores. He apparently made a point of looking into our psychology, too. And it is interesting to note that, as a result, he has modeled himself upon the British method of approaching us, not on the French. Clemenceau is not a Mediterranean Frenchman anyway. He perceived in the British approach something superior to that of any other people. It is not likely, however, that he made the mistake of thinking that this was due to art, the art of diplomacy or duplicity or any other. Clemenceau was shrewd enough to see that it was the naturalness of kin speaking with kin in the kindred tongue.

But he doesn't understand. Probably he will never understand. He is one of the men who failed, miserably failed, but he does not know that yet. His part is played; his afterpiece will have no effect. America will never heed the appeal of men like Clemenceau because their language belongs to vanishing things; even when they speak for the League of Nations it is not the League that the people of America dreamed during the war.

The press is too polite to say so, but Clemenceau's tour has failed. Everything undertaken in behalf of the Internationalist Financiers will fail henceforth. They picked a strong one when they chose Clemenceau, but not strong enough to overcome American common sense.

Mr. Ford's Page

THE President's Message of December the eighth, which he addressed to the special session of Congress, has that strong quality of directness which makes it also a message to the American people. For the first time, in this manner, has the President shown a master-mechanic touch with things. For the first time has he come out from the circle of mere political ideas and talked about actual circumstances, the real things of the people's daily life.

Now, if besides seeing what the problem is, the President can go ahead and solve it, he is the man the country has been looking for. But it is so short a time since the ship subsidy message was delivered, that it is difficult to believe they both come from the same mind. Or, perhaps, we may ascribe one to the political pressure brought upon the President, and the other to the popular pressure. Here is hoping that the popular pressure will grow so strong as completely to crowd out the political.

In tackling transportation the first thing, President Harding shows a true understanding of some of our underlying difficulties. Of course, there is something still more underlying, but it does not often come to the surface in political discussion. The railroad situation is bad, and the reason for its being bad is the impossibility of a road being a good railroad proposition and a good speculative proposition at the same time. The time arrives when you have got to become either a railroad or a gamble, and when most of our railroads reached this point their banker owners got the better of their railroad operators, and the railroads became mere adjuncts to a speculators' game.

The President notes the extent to which Government has been forced into railroad regulation on account of the importance of railroads to the country and on account of their failure to render service. And in noting this he does well, for it will enable the public mind to see the connection between the national interest and the railway situation. But it is also worth while noting that Government attention has been focused exclusively on the operative side to the serious and important neglect of the financial side. Railroading is bad, not because railroaders do not know their business, but because they cannot serve the railroad and the speculative demands at the same time. That side of the question would bear investigation.

> *MR. HARDING goes very far in his message of December 8, much farther than in any other utterance. He begins to see the problem, not all of it yet, but he has gripped it by the practical end; and that is the beginning of accomplishment. Seeing is no guaranty of doing, but it is preliminary to doing. At any rate, he sees that the problem is economic and not political; and being so, what can the politicians do about it? Mr. Harding will find that once the right economic conditions are obtained, there will be no need of commissions with power to force men to accept them: right economic conditions make their own way and people accept them as naturally as they breathe.*

This is one of the disappointing parts of the message, it sees so clearly one side and seems to be in the dark about the other side. The President is right when he calls for co-ordination in the operation of railways. An "allied command," so to speak, of all our transportation facilities would be a great improvement. He is right when he summons to a wider use of waterways and motor transports. It is refreshing to hear him advocate the abolition of the Railroad Labor Board—although the pleasure is somewhat dampened by the reason he gives. Taking it all in all, the President has given some straight talk about the whole matter, and it is to his credit that he has set forth so clearly the terrible calamity which the farmers have suffered from transportation mismanagement.

But all this is certain to lead nowhere, even in the hands of a man capable of dealing with the practical question, unless the other end of the problem is considered too—the speculative end which demands its pound of flesh at the expense of efficient railway operation. It is the failure to consider this other end of the problem which leads the President to give as his reason for desiring the abolition of the Railroad Labor Board that it lacks power to enforce its decisions.

Here is a cardinal principle to bear in mind: *right economic conditions never have to be enforced.* They make their own way. Men do not require force to accept just wages and proper working conditions. But just wages and proper working conditions cannot be given when the business itself is under such bonds to a speculative ownership and control that it cannot build itself up in its own strength. That is where the problem leads directly back to the elements with which the President's Message does not deal. It would be worth a great deal to the country if the political rulers could only see that to refrain from examining these matters is not to defend what is sometimes called "the existing order" (that is, the American order), but to jeopardize it, for it requires no unusual wisdom to see that it is the anarchy, the economic and industrial anarchy of financial speculation, much of it in the hands of International Financiers, that is really jeopardizing order here. Business is the operation of service; to make "an attack on business" one does just what speculative finance is doing—making it impossible for business, railway business or any other, to render service. The real attack on business has been made by high finance. And the President cannot really see to the core of the railway problem until he explores the speculative end also.

These observations do not in any way qualify the satisfaction with the direct way in which the President handles the problem as far as he can see it.

The President is absolutely sound on the question of child labor; but when you trace this also you find it ends in the anarchy of conscienceless and irresponsible speculative finance. We know where the losses of child labor go, where do the profits go? If industries were not being pumped dry of their very life by absentee interests, child labor would not be resorted to. How long shall we be in seeing that all these things head up in an unholy system which permits the largest returns where no service is rendered?

As to the alien element in our country, that alien element which comes to do harm instead of to share and help us increase the degree of economic and political security which is the aim of civilization, the President seems to have some thoughts. What they are in their entirety is not clear. Accompanying them there seem to be other thoughts unfriendly to certain movements which indicate awareness and resentment of alien influences here. Together they seem to indicate that the country has awakened to the situation earlier than the Government has, and that the Government resents it. But this nation is in the hands of its people and not exclusively in the hands of the residents of Washington. It is true that the American people have been alarmed for some time back, not only at alien influence in the country, but in the Government. The alien influence which is meant is that which would not be considered politically expedient to name as alien. Let the President be open and fearless in this matter; let him not fear truth—there is no prejudice, there is no injustice, there is no hyphenation in truth—and then his plan for alien registration may come to something useful. Otherwise, all that the country has now is the hopefulness which even the President's notice of the matter gives. Let us be open-doored and open-hearted to all who come to throw in their lot with us, all who recognize America as an established idea; but let us not be longer imposed upon by those who come to make our land a base of operations against Christian civilization.

The President's stand on our international attitude is correct and noble and exhibits no shadow of uncertainty. He has stated the true American tradition in these matters. We rob the world of nothing as we stand, and we prevent ourselves being used for the base designs of others. It is not possible that those who have been led by a mistaken idealism to take the opposite view can really know what are the influences which most feverishly desire the United States to be in armed alliance with policies which, as long as we remain American, we can never sanction.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

No Nation Is Free While in Money Bondage

People of the U. S. Doing Business on Private Money: $1,000 in Checks for Every $1 in Cash: Corner on Money Nothing to Corner on Credit

By PAUL G. LEWIS

EVERY now and then in the past, our country has been visited by economic pests, plagues of panics and industrial depressions, so that it has become a common thing for some men to forecast their arrival.

Our country seems to have followed with considerable regularity pendulum movements swinging from the one extreme of so-called prosperity to the opposite extreme of disaster, peril, distress and great suffering.

That such economic movements have been and are still taking place, has never been better sensed by any public-at-large than by that of the present time.

There is in reality just as much reason for having panics and industrial depressions with their consequent national disturbances and upheavals, as there would be for having a return of the black plague to our modern and sanitary cities.

When we take a square look at only the most fundamental economic structure of our society during all times of national peace we notice that:

(a) There has always been in existence a great abundance of all kinds of raw material and manufactured commodities.

(b) There has always been a full measure of every kind and class of physical and intellectual labor, willing at all times to work in his or her respective sphere.

(c) There has always been great need that every man should work, not only for the purpose of contributing his share toward the support and progress of his nation, but that such nation may thereby acquire in the fullest measure a maximum market for everything offered for sale. For a man out of work, and out of money, is out of every market where cash is necessary.

$1 in Cash for $1,000 in Business

WHY is it then that in a land of plenty, and a general willingness to keep it so, we are so often afflicted with acute panics and depressions, while the greater part of the time we are never entirely free from some sort of chronic unemployment among the masses?

We have never been able to place the blame upon raw material or manufactured commodities. Too much raw material or too many manufactured commodities have never created a single panic or depression; neither has a lack of sufficient raw material or manufactured commodities had economic power to create panics or depressions.

We have not been able to place the blame upon labor for it was always willing to work although unwilling at times to overwork or be underpaid for its work.

This brings us to the only remaining economic factor in the life of any nation, namely the FINANCIAL means whereby all production, transportation and distribution of every form of wealth from raw material to finished products, and so on, is effected or consummated.

This factor embraces not only any form of medium of exchange, but also all banking institutions extending the privilege of Discount to their customers.

In considering the most important medium of exchange in everyday use, we find that checks of individuals are used to such an enormous extent that their importance in the machinery of business is most amazing to the uninitiated who supposes that business is done with money.

In order that we may have some authoritative information regarding the approximate extent to which checks are used in the place of money, it would be well to refer to the 1916 Report of the (United States) Controller of the Currency, Volume 2, page 918, wherein it is stated that for the satisfaction of every $1,000 worth of economic exchanges for which personal checks were given through the New York Clearing House in one year, there was just the small sum of $1.78 in all of the 34 New York Reporting Banks. Business to the extent of $1,000 was done with $1.78 cash. The foregoing does not, of course, take into account the vast amount of checks which neither passed into nor through that clearing house.

We are therefore confronted with the facts which justify the assumption that nearly the entire economic business of our nation is discharged financially by means of checks drawn against banks; and that every drawer of a check is enjoying the special privilege of making his own medium of exchange, whereas his respective bank, also a private person (association), is engaged in establishing a quasi legal tender value for every such check whenever the bank's O. K. has been granted thereon.

It is certainly a most wonderful privilege conferred upon individuals which the political government cannot help but see; and that government must realize, if not wholly, then partially, the dangers which are sure to arise from the exercise of a power by individuals which is not only intended for but absolutely belongs to the government.

The power of depositors with the aid of their banks to issue something (checks) which may be used in the place and stead of the United States Government's mediums of exchange for the purposes of extinguishing financial obligations, will no doubt be held not to be in conflict with Section 10 of the United States Constitution which provides that "No state shall make anything but gold and silver coin a tender in payment of debts"; for the reason that this power is exercised by "individuals," and NOT THE STATE; and perhaps justified also on the grounds set forth in Article 10 of the Amendments to the Constitution as follows: "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are RESERVED to the States or to the PEOPLE."

Whether or not authorized by the Constitution, the fact remains that one of the very important functions of the government has been and is daily being exercised by banks which are thereby able to wield a most tremendous power for good or ill at their discretion.

The fact that depositors of checking accounts are able to issue their own medium of exchange is of little economic value to themselves outside of their (checks') convenience, as compared with the O. K. of a bank which imparts to such checks a quasi legal tender value. It puts the money power of a check into the hands of bankers. Yet that is by no means all the power which banks employ. The most important power exercised by a bank is the one which furnishes the necessary credit which those customers receive whose deposit is derived via Discount, and at the same time yields the enviable profits of the stockholders of the bank.

The banks in extending the privilege of Discount to their customers, thereby enlarge also the field against which checks may be drawn.

Figuratively speaking, it might be said that such banks are each operating a sort of a mint where the I. O. U. of customers are merely exchanged for the I. O. U. of the banks, and a credit is coined in favor of each borrowing customer.

A "Credit Corner" Worse Than "Cash Corner"

WE HAVE here a wonderful and most powerful monopoly which the banks can operate or refuse to operate at their own discretion, with reference to "credit" via discount; and by this means they can at any time open or close the mint of credit, just as they please, and to whom they please, provided the ratio of Cash Reserve to Deposits is not thereby dangerously disturbed or violated.

In plain language, the banks of Discount have a "corner" on credit, giving or withholding it from the business world.

When we consider that every economic exchange requires for a full satisfaction, at some time or other, some kind of a medium of exchange, it must be evident that a control of or "corner" on the issuance of checks, or a "corner" on the control of credit, presents a state of affairs which is a hundred thousand times more dangerous than any corner on staple commodities.

A nation can survive a corner on wheat by living temporarily on other cereals; or survive a corner on beef or pork by eating eggs or fish, and so on; but when the power of the medium of exchange (checks) and credit become vested in private individuals operating banks, these possess a monopoly or "corner" not only on the gold and silver and credit, but a corner on the WHOLE LIFE of every man in the nation, because it is only by means of an unrestricted flow of the medium of exchange that a nation willing to work can live.

Not Free While in Financial Bondage

CLEMENT JUGLAR, in his book published in 1893 by Putnam's Sons, New York and London, entitled, "A Brief History of Panics and Their Periodical Occurrences in the United States," has the following on page 127:

> "The study of a single section of the balance sheets (banks), that of discount and loans, has allowed us to follow the periods of prosperity, of panics, and of liquidation."

and again on page 93:

> "Panic of 1873 . . . . It relapsed on September 1st, and requests for accommodation redoubled until the sharpest moment of the panic. On that day there were no quoted rates; money could not be had at any price: some few loans were made at 1 1-2 per cent PER DAY."

The economic history of our nation has not only been indelibly written into the account of Loans and Discounts, but the same account has also been responsible to an almost inconceivable extent, for the making, shaping, molding and guiding the evolutionary progress of our country.

The report of the (United States) Controller of the Currency, dated June 30, 1919, embracing all reporting banks in the United States and Possessions, numbering in all 29,135, and including the 12 Federal Reserve banks, shows in round numbers as follows:

Total Deposits	$33,921,734,000
Loans and Discounts	27,114,262,000

After the banks have deducted the interest charged for discounting the notes of their borrowers, the balance is credited to the checking account of such borrowers who thereby also become "depositors." In other words, out of the 33 billions known as DEPOSITS, about 27 billions represent the I. O. U. (notes) of borrowers, whereas the balance of about seven billions represents real deposits of both checks and money.

To put it another way, the deposit of 27 billions is merely a *promise to deposit* at some future time; and such deposit therefore rests upon a DEBT. Hence our economic life and activities are sustained and supported largely by DEBTS.

More than 80 per cent of the commercial business of our country, including speculations, is transacted upon the foundation of I. O. U. paper for which the banks of discount give "credit" (less interest); and against this credit checks are drawn. It ought not to be difficult therefore to understand and fully realize the enormous power owned and exercised by men engaged in the business of banking, for these have permitted the entire structure of our nation to be placed over 80 per cent in debt bondage.

We are therefore compelled painfully to admit that as long as our country is in financial bondage, no matter to whom, we are as yet not a free nation.

Did not Europe very recently demonstrate to us that even nations must submit to the economic yoke of the financiers if credit is desired? And did not this same power in our own day present a most frightful concentration, when a single individual can assume a dictatorship in finance which makes nations and principalities fear and tremble more than did any king, kaiser or potentate?

Whatever may be said or done in the interest and welfare of the nation, there is nothing which could more illuminate the dark path of our economic journey than to place the operation of our banking system and the character and quality of our every kind of medium of exchange into the bright light for public observation and careful study.

It is almost needless to state that no progress is possible as long as attention is directed toward individuals instead of their occupations, which latter alone is responsible for the very undesirable results complained of.

Thus the public ought to view the banker and his business apart, praising him for his character and personality where he deserves it, but censuring his banking system where it has not yet been able to bring about a Constitutional General Welfare, or where it actually hampers the life of the people.

Ever Hear of a Fish Line?

(C) Ewing Galloway, N. Y.

Truckman Foley has a fish and bread line all his own. Introducing Mr. Richard Foley, truckman, and his fish and bread line near Fulton Market, New York City. The "line" is getting fish and bread on Friday. The stout man in the picture is Mr. Foley, who furnishes the fish and bread—good fish and bread, too. The slender man is John Walsh, who hands out the fish for Mr. Foley. Once a week Mr. Foley gives fish and bread to a long line of women from very poor homes.

Story of a City Whose Glory Lies Chiefly in the Past

Stands Now a Common County-seat "Like a Ragged Beggar Sunning"

By CARL SCHURZ LOWDEN

THIS is the story of a city that was, of one town whose glory lies chiefly in its past. Rome needed 400 years to decline, fall and die; but this Hoosier town, be it said, is not imitating ancient Rome. No, indeed! The place still carries on very cheerfully; in fact, it has a warm, pleasant sort of a personality that will bewitch you if you give it even half a chance.

My ticket read "Indianapolis to Madison, Indiana." The train bumped along in the fashion of the usual two-a-day-each-way. It was commonplace and frowsy, totally lacking in character and it did not care. But at North Madison, about three miles from my destination, I sensed a change. There seemed to be a steady, sharp descent with the locomotive holding back as if it had acquired a balky mood. Later I discovered that this apparent stubbornness had saved us from a plunge into the Ohio River.

The first picturesque thing you spy after the tumble out of the coach reminds you of the town's former greatness. It is an old bell on the lawn of the railroad station. On approaching it you observe that it hangs in Indian camp-fire fashion from the apex of three bark-covered posts. The piece bears a crack not unlike that of our cherished Liberty Bell. A neatly painted board at the top of the support anticipates your desire for an explanation. "Bell cast in 1849," it tells you, "and hung in the station at Madison, Indiana, on the old Madison & Indianapolis, later the J., M. & I., and rung 30 minutes before train departed."

The old days are very dear to the older residents, for then Madison was a boom town. The packets were very active. The whistles of the steamboats told the thriving village it would soon be a metropolis. The piers were piled high with freight. It was the terminal of the only railroad in Southern Indiana. Madison became the "first city of Indiana" because it was first in commerce, population, wealth, literature, law, religion, politics and social enjoyment.

During the fifties the big river steamboats lay in lines beside the wharves stacked with bags of wheat. Warehouses were filled to the roofs. Countless barrels of mess pork were packed for shipment to the South as far as the Gulf of Mexico and to the East as far as the British Isles and into the mainland of Europe.

The Crimean War of 1853 to 1856 was fought largely on Madison-packed pork. In fact, Madison rose in those years to world eminence as a pork-packing city with a record of 200,000 hogs handled there each month.

The influence of railroads as a vital factor in the making and unmaking of localities can be seen in the decline of "The Gateway to the State." During the thriving fifties the lone railroad brought the business of the interior to this favored city on the Ohio River. Then the B. & O. and other lines invaded the territory. Madison fought bitterly for self-preservation, but it was a selfish cause that could not win. Madison lost its profitable monopoly, went down but not out.

The former first city in the state has long since taken rank far down the scale. The packing plants are gone. Its chief fame now consists of its being a quaint and charming place bespeaking a picturesque past. It may be called picturesque now without offense to its residents who rejoice in its repose and natural beauty, and do not complain because the wharves are not as busy as they used to be. Despite its reverses, Madison has some remnants of its pristine glory. The social life, which had a distinction all its own in those other days, possesses much of that distinction yet; and the wealth that accumulated there in the long ago has left evidence of its existence in the numerous quaint mansions which stand to the present day.

The informality one meets in Madison is truly delightful. You go into a restaurant and find the place crowded; therefore you sit down at a table beside a man or a woman whom you have never seen. Pretty soon your fellow diner avows it is "a nice day." You did not need to be told, you knew it already; yet somehow it breaks the ice, as it were, so that the prosaic process of eating becomes a delicious adventure.

The barbers are loquacious in Madison. They believe in entertaining their customers. If I were a barber, however, I think I would install a phonograph and save my jaw; perhaps some of the patrons would vote for the mechanism that can be stopped whenever you wish.

A rumbling wagon with a bawling calf and a half-dozen squealing pigs constituted my alarm clock the first night I was there. I like to be waked up in such picturesque style. I mentioned it to my neighbor at breakfast; straightway the old resident was reminded of the glorious days, and he told me the story of how the town had held the proud position of the world's principal pork-packing center "back in the fifties."

If you ever drop in on Madison, you are almost sure to like it because it will make you feel at home; and yet you will sense a certain atmosphere of forlornness that betokens a town with a wonderful past now dead. It is somehow forever looking back; if it could live fully in the present, it might stage a real revival. If I were to diagnose its ailment, I might say something about the number of retired residents and conclude that it is "mainly psychological."

You cannot deny that Madison is a beautiful spot for retiring when life's work is done. Everywhere you look you see trees, broad and magnificent, shading the homes and streets. Many of them are graceful elms. The trees are very attractive in themselves, but they have certain high-lights that enhance their charms. The orioles love them and weave their nests to the swaying branches. The wrens choose manufactured homes, but when they sing they go into the shrubbery and lower parts of the trees. The redbirds add a dash of color, as do the merry bluebirds; and the chickadees chatter cheerily.

Jefferson County, especially the region around Madison, is noted for its wealth of scenery and romantic spots. A few miles northwest of Madison lies Clifty Falls with its glen. The series of falls is more than 200 feet in height, the principal drop being 80 feet over a jutting ledge of rock. Clifty Falls has a beauty peculiarly its own. Between North Madison and Hanover are a number of falls bearing such picturesque names as Dead Man's, Crow's, Chain Mill, Hart's and Butler's.

You are not surprised that artists dwell in Madison; you would be surprised if such a pleasing place had none. William McKendree Snyder immortalizes the beech groves of the country, and contributes other real memorials of its picturesqueness to Indiana art. F. A. Genter owns a photograph studio, but he spends a share of his time in recording on canvas the loveliness of the tree-clad hills and winding waterway. George Gray Barnard, the famous sculptor, lived his youth there and there got his first artistic inspirations.

Incidentally, I may mention that Madison is a city of beautiful women. You will see more pretty faces and figures on its streets than in any other town of 10,000 population that I know. Mr. Genter's sister, Victoria, is one of the girls that gave the town its enviable reputation, as she invariably wins a high place in any beauty contest.

Despite its apparent languor and easy-going ways, Madison possesses some factories. There are cotton, woolen and flour mills. Other products include candy, ice cream, crackers, furniture, glue, nails, tacks and cigars. The pearl-button factory is now inactive largely because the mussel fishers have fished the rivers clean, also because what few workers there are can get better prices by shipping the shells.

The railroad grade from Madison to North Madison is said to rank along with the steepest of its kind. I know that going into Madison you fall forward, and that on going out you hope the back of the seat will not give way and let you tumble heels over head.

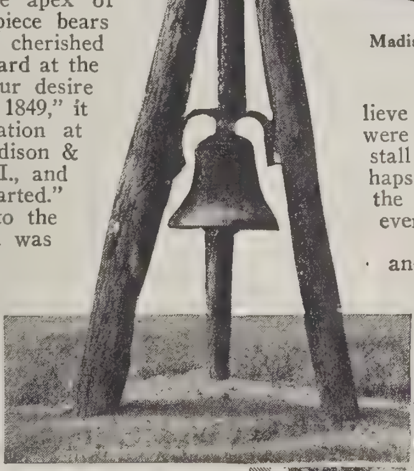
Madison would like to regain its former glory. Perhaps it could if it would specialize.

The young people, joy-riding, speed by, singing,

"My home town is a one-horse town
But it's good enough for me."

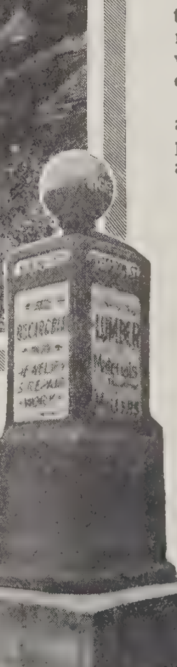
The main drop, over 80 feet, of beautiful Clifty Falls.

Madison nestles in a curve of the placid Ohio River.



The old signal bell on the railroad station lawn.

The Shelving Rock and Cascades on the North Madison pike.



Traffic posts pay for themselves by carrying ads.

Why "Little Bob" Rode In on an Avalanche

La Follette Triumphant in Face of the Most Bitter Battle of His Life

By H. E. COTTON

THE re-election of Robert M. La Follette to the Senate last month, after one of the most strenuous campaigns on the part of his opponents that Wisconsin ever saw, proves an entirely different set of facts from those which some distant and less interested watchers profess to see back of it. It proves that the voters in this state have been trained to observe and think for themselves. The free public schools are functioning exactly as the founders of the American public school hoped they would. The people of Wisconsin, a fair proportion of them being native-born descendants of New England pioneers, know what the Declaration of Independence and the Constitution say. They believe that these instruments mean what they say. Moreover, these citizens know what they want, whether or not they know what is good for them. They want the representative government to be really representative. They know that what was offered to them by the opposition forces which met La Follette was not representation of a majority of Wisconsin voters.

The ancient Romans would have called Wisconsin an agrarian district. The voters are mainly agricultural in their interests. The percentage of farm owners is high. The business interests depend mainly upon direct dealing with farmers. The towns are pretty largely "farming towns," dependent for their business life upon the patronage of farmers.

But Wisconsinites are well posted, as the saying is. The schools are pretty effective. The university, through its far-famed extension division, comes into close contact with every community in the state. The people have been slowly but steadily learning how to think. And the election of 1922 showed a more thoughtful mood among Wisconsin people than has any previous election. And it showed them better informed.

La Follette was elected absolutely upon his record, including his war record. Plenty of people voted for him who doubt his ability to do what he believes ought to be done in the Senate. Many voted for him who even doubt his entire sincerity. They voted because of what they *know* he has done. And I know from close contact with hundreds of the people in the small towns of Wisconsin that there are no more loyal people in America than the people of Wisconsin.

The people of Wisconsin are loyal to the ideal America. They are insistent that America shall make good as a true exponent of democracy. What was called "Wisconsin's disloyalty" during the war was merely Wisconsin's intelligent refusal to be hoodwinked into upholding the monstrous practices of profiteering and "patrioteering" which prevailed in some parts of the country.

There are few large cities in Wisconsin—no really large centers of population. The leading people in any Wisconsin city form a group where each is known by his first name. Few illusions or misapprehensions regarding the character of any one of them can long exist in the minds of the others. Every voter in most of the counties knows the county officials as friends and neighbors. The farmers are personally acquainted with the members of the legislature who represent them, the lawyers, judges and leaders in the community life generally, in their own and neighboring counties.

When, during the early days of the war, an incompetent or dishonest politician was appointed chairman of a county council of defense, the people in his locality passed immediate and competent judgment upon the fitness of the appointment. They watched him, in more than one instance, using the position for his own aggrandizement, and their loyalty to America—the ideal America—which some of them had entered as a refuge, but which the ancestors of more of them had built as a haven of liberty, was outraged and insulted. Nor were they fooled by his blatant professions of "one hundred per cent Americanism." They saw the growth of a self-constituted and self-advertised class of "hundred per cent Americans," who kept their own sons out of the army by hook or by crook. They saw the two hundred per cent Americans who were one hundred per cent Americans on the platform, and took one hundred per cent profit (or more) on everything they did to help win the war.

These people opposed America's entry into the war, but when America was in the war, they sent their sons and their money to war in serious earnestness. The "glory" and parades, the pomp, the clap-trap and the holiday phases of the early preparations disgusted the thinking people of Wisconsin. They realized from the first what a grim horror war was bound to be. This also was due to the success of the public schools.

The attitude of La Follette had practically no bearing upon the internal affairs of the state during the war. Many of us felt, as he felt, and as many others felt, that our success in the undertaking would have been better assured and more likely to endure if the truth had been told to the nation—if the foundation for the whole business had been one of truth instead of the sheer fabric of falsehood that it was.

The Americanism, that promised to take care of the soldiers during and after the war, is Wisconsin's sort. The Americanism that says we can't afford to pay the soldiers any sort of bonus or adjusted compensation, and at the same time reduces the taxes on stolen fortunes and billions of graft, is not Wisconsin's conception of what the Constitution-makers intended. We Badgers believe in honesty. That is, a sufficiently overwhelming majority of us do, so that La Fallotte received the biggest vote this year that he ever did. And the voters who cast that huge preponderance of ballots are at least as loyal to America and as desirable a lot of citizens as the ones, for instance, who sold their votes to Newberry over in Michigan.

The people who fear excess profits taxes have spread many lies and misconceptions about La Follette. They talk about his appeals to unworthy motives. They try to brand him as a Socialist. They call him a demagogue. They seek to cast doubts upon his sincerity. This last election disproves the whole list.

The majority that practically wiped out the Democratic party in the Wisconsin primary, and that swept all other candidates into the same sort of limbo, cannot *all* be Socialists. They cannot *all* be seeking unworthy and illicit things. It is impossible that they are *all* deceived as to his sincerity. Their average intelligence is high. No demagogery could possibly fool them all.

The whole opposition is preposterous. Wisconsin people, as I know thousands of them personally, are loyal Americans. They love the America that the Puritans founded and the Revolutionary heroes freed. They revere the America of Lincoln and Webster, of Roosevelt and Wilson. But they are freely and frankly disgusted with the greed and the graft and the insincerity of the America that goes on talking one thing while it deliberately plans another.

May I introduce a personal experience by way of illustration? In the county where I owned a weekly newspaper during the war, a certain lawyer-politician had charge of the Liberty bond selling campaigns. It was a hard job, and he did it well according to his lights. But he was making use of his position and the power it carried to further his own financial and political interests. I undertook to warn the readers of my paper against his personally directed efforts along this line. He had me summoned to appear before the state director of the Liberty bond campaign to answer for interfering with the sale of bonds.

The people in my section of the county were mostly of Welsh and English descent. Several of us were directly descended from the Pilgrim Fathers. This man was the son of an immigrant from a country that was opposed to America in the war. He was an opponent of La Follette and a blatant "hundred per center."

My neighbors had held the record in the county for oversubscribing their quota in the first three campaigns. They had hung up one or two state records. I was able to show the state director that instead of "interfering with the sale of bonds" I was encouraging it, and was interfering only with this man's schemes for private profit and advancement improperly derived from such a position of public trust and service. Again the people of my neighborhood oversubscribed their quota of bonds on the first day of the campaign.

But that man still holds that in interfering with his strictly private plans for self-aggrandizement I was interfering with the sale of Liberty bonds. He cannot separate the two in his mind. He is typical of the opponents of La Follette. In their thinking they cannot separate the welfare of the Republic from their own enjoyment of special privileges. La Follette can. And he does. Hence their opposition to him, and hence also its violence and bitterness. It may cost them some money.

And the straight-thinking people of Wisconsin can separate the two elements. They did it when they disregarded party lines and voted for him, ignoring what they considered minor issues, like the beer-and-light-wines rainbow or the repeal-of-prohibition will-o'-the-wisp.

La Follette's triumph in Wisconsin is not a triumph of Socialism or Bolshevism. It is a triumph of Americanism—the sort of Americanism which tries to come closer to the Golden Rule and farther from the rule of gold. It is a triumph for the sort of Americanism which would *give each person a vote instead of giving each dollar a vote.* Whether they voted for the right man to put this sort of Americanism into effect or not, that's the sort of man Wisconsin believes him to be. And, anyway, that's exactly what the most of Wisconsin voted for when "Little Bob" was re-elected to the Senate in 1922.

Rocking-horse Passing as Home Shrinks

Concluded from page 3

This is the only country which makes dolls with composition heads. These heads are an American invention and are fashioned by a secret process. It is aimed to make them practically unbreakable, while light and true to life. The molds are made of starch and modeled from designs which have been prepared with the greatest care and after weeks of study and experiments. When the heads have hardened, they go to the tables of the artists who decorate them, where some of the work, like that of tinting the hair and applying a delicate blush to the cheeks, is done with an air-brush. Each operator is a specialist. One paints in the white of the eye and another puts on the tiny dot which makes the pupil. These may seem like simple things to do, and yet the way in which that dot is applied determines the expression of countenance which the doll will wear as long as it exists. Another expert puts the carmine on the lips and another the extra touches which are required by dolls of a special character.

Meantime the bodies, as well as the arms and legs, are being fashioned. The bodies are made of cloth which is cut into the right shape by men armed either with huge shears or great knives. Fifty or more squares of cloth are placed one on the other and all cut by the same motion and the cloth is so utilized that there is almost no waste. Next the bodies are sewed by girls working at sewing machines operated by electricity and they go to men who stuff them with cork dust or excelsior.

In former times sawdust was the material used, as most children learned by investigation, but has now given place to filling which is more satisfactory. After the bodies have been filled, the heads, arms and legs are attached and then all that remains to be done is to put on the clothing, which work is given over to young women seated at long benches. Much time and thought are given to the designing of the apparel in which the dolls are to be arrayed, for a few details often make no little difference in the sale of a doll. It is an interesting fact that most of the employes in the doll factories are Italians, both men and women.

Many doll makers endeavor to impart as likelike an expression as possible to the gentle products of their factories, but few go to the trouble taken by an Italian in Paris, whose dolls are sold and highly prized in this country. This man, who is actually an artist, goes into the streets and when he sees a child with a face which attracts his attention, he makes a quick sketch. From many hundreds of these sketches he selects a few dozen which are to give him his season's models. Then, when the dolls are made, he dresses them in quaint and lovely gowns, giving them a charm and distinction which is unique. Comparatively few French dolls are sold in this country, but those which appear in the stores are distinguished by the general elegance of their appearance and especially by the richness of their attire. As a rule, though, French dolls, while pretty in a vacant-eyed sort of way, seem to have no character. The wooden-bodied jointed dolls were invented in France and made there exclusively for several years, but American manufacturers soon caught the idea and improved on the models.

In Toy Town, much attention is given to doll furniture. More than half the toy trunks made in America come from there. A year's output placed in line would reach fifty miles, and if piled one on the other would reach 25 miles into the air. This season cedar chests have been added. They are made of genuine cedar and will effectively keep the moths away from Dolly's winter clothing.

Toy Town had the kind of beginning one reads about in stories. Morton E. Converse was in the woodenware business many years ago, and when paper collars came into fashion he began making wooden boxes for them. It occurred to him to whittle out a little table and see how it would look in the center of a box. Then he had another inspiration and added a set of dishes to go on the table. He began putting these novel playthings into his collar boxes for the children of the men who bought the collars. Immediately orders began to come and he set up a factory with 25 men. There are more than 500 employes in the present Converse shop.

It did not take Mr. Converse long to realize that there was more money to be made from toys than from woodenware. He added new kinds and the business grew rapidly.

A great many mechanical toys are made in this country and some of the metal toys commonly sold in the past as importations from Germany, France or Switzerland were actually made in New York City. In many instances, though, the makers are actually German, French or Swiss workmen who have come to this country, bringing their trade with them. One large metropolitan toy maker arrived in New York a few years ago with but five dollars in his pocket. At first he peddled tin toys on the street, but now he has a business which provides work for more than 3,000 persons in this country and in Germany, where he has a branch.

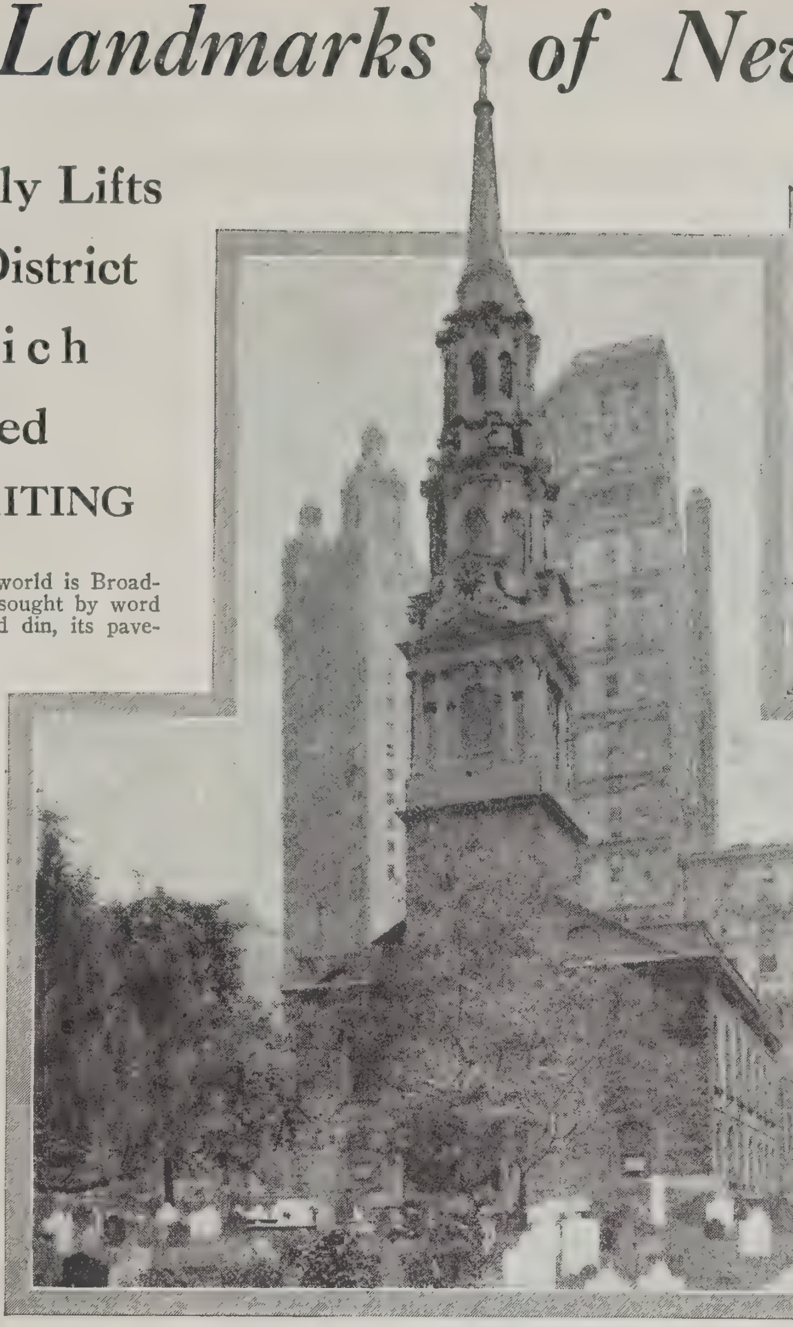
Some years ago a Brookline woman began making rag dolls and now hires many girls to help her make them. Another woman has built up a large business in colored dolls, although it has been established as a fact that the larger proportion of colored children prefer white dolls if the choice is left to them.

Occasionally a toy comes into being through a very unusual circumstance instead of being deliberately invented to make money. The Whang Doodle doll is an illustration. Everybody knows these dolls with their short bodies and their immensely long, thin legs, which can be tied into knots if desired. They have been very popular with college girls for some months and are to be seen even on Fifth Avenue. To tell the truth, they sell more readily in the women's departments than in the toy shops, for children are not pleased as a rule with toys which are grotesque or bizarre. The Whang Doodle dolls had their genesis in the mental attitude of the women of Austria. While facing privation and misery they began making these eccentric dolls as an indication to the world that they were not dismayed nor broken in spirit. The world, or that part of it which knew the situation, began buying the dolls as an indication of their admiration. Now imitations are being made in this country, but the long-legged absurdities are being imported in large numbers, especially by dealers who know that they are made by women of birth and breeding who have been reduced by the war to want and suffering and whose heads are being kept above water by cloth-covered, cotton-stuffed dolls.

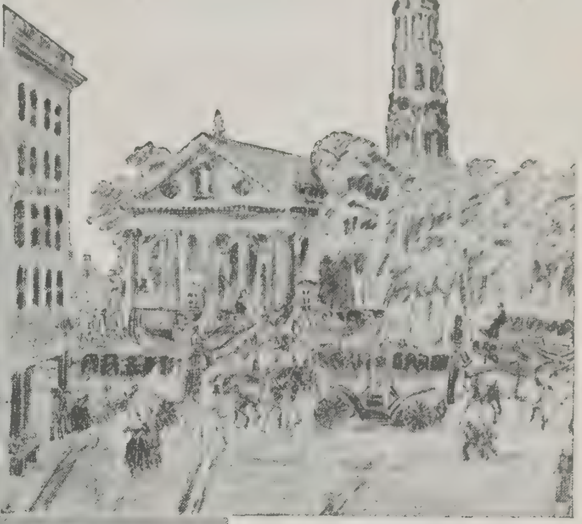
Colonial Landmarks of New York

St. Paul's Serenely Lifts Its Head in District From Which Soul Has Fled

By MAY B. WHITING



St. Paul's, at Broadway and Vesey streets.

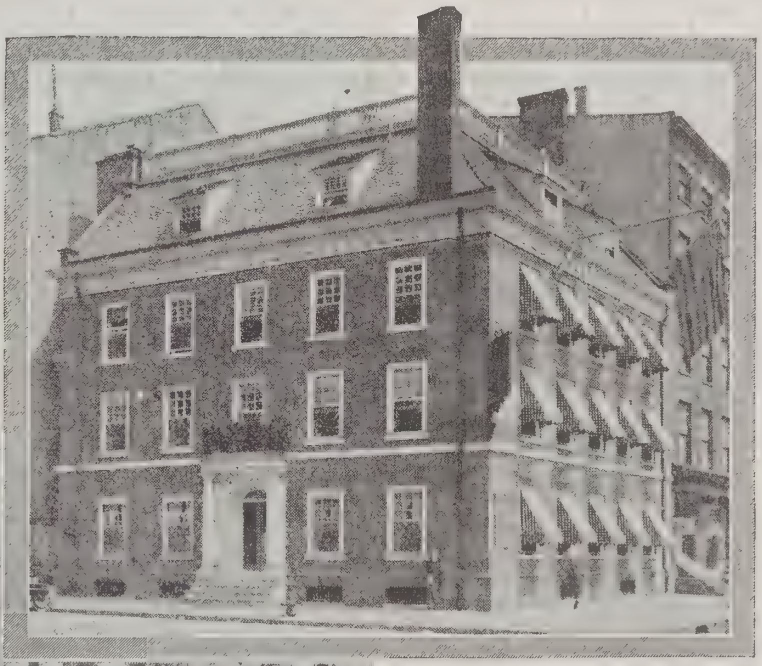


The Broadway coaches that went out past St. Paul's in 1800.

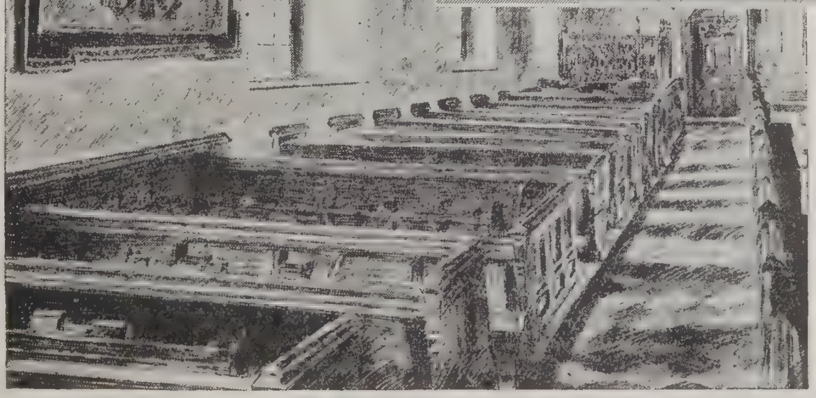
THE most famous street in the world is Broadway. A thousand artists have sought by word or color to catch its surge and din, its pavements swarming with men like ants, its lust for money, even its bit of heaven hacked into grotesque outlines by impudent skyscrapers. And yet, where the tide runs swiftest, between Fulton and Vesey streets, is a haven where grass grows and ivy entwines crumbling stones, and once proud monuments, worn into hollows, serve as bird baths after every shower. Serene in its churchyard, Saint Paul's lifts its head, patiently pointing upward with spire blackened by age and smoke, as if stained by the sins of those who pass beneath its shadow.

Saint Paul's in the Fields it used to be, for when it was built, in 1766, the sod that was upturned was green with the growing wheat. A lawn sloped to the bright river which then came up as far as Greenwich street, with a pleasant beach, along which Jonathan Edwards used to stroll, declaiming his sermons, during his ministry in Wall Street. All about were orchards and groves, while splendid horse-chestnut and elm trees dotted the churchyard. When one of them was cut down, George P. Morris was inspired to write his poem, "Woodman, Spare That Tree." Cows grazed at will about the chapel, and once, on a warm Sunday, a horse walked in at the open door and paced halfway down the aisle. Indeed, the vestry of Trinity Church was very severely criticized for building so elaborate a structure in so lonely a spot, so far from any possible center of population, and so difficult of access.

The architect was a Scotchman, Thomas McBean, a pupil, tradition says, of Sir Christopher Wren. He took as his model Saint Martin's in the Fields in London, which stands back of the Nelson monument in Trafalgar Square. When it was completed the new chapel was considered a paragon of elegance. The élite of the city were of its congregation and Lord Howe, Major André, Lord Cornwallis, and the midshipman who was later William IV of England, worshiped there.



Fraunce's Tavern at Pearl and Broad streets.



The Washington pew at St. Paul's.

On the night of the British occupation Trinity was burned, but Saint Paul's was only scorched, and was kept open throughout the war, patriot or Tory preaching from its pulpit as the fortunes of war varied. With the coming of peace, seats were reserved for the legislature and the common council. The governor of the state had his pew there, and, in 1789, when New York became the capital of the Federated Commonwealth, a pew was set aside for the President.

Washington was always a regular attendant. From 1789 until 1891, as often as Sunday came around, his diary bears the record, "Went to Saint Paul's in the forenoon." A writer of the day tells of "walking into the country" and climbing to the gallery for the sake of seeing the stately pair enter their pew. No doubt it was a sight worth a far longer journey. The Father of His Country always had a soft spot in his heart for the formalities of life and was never averse to a bit of dignified display. At that time there were only half a dozen coaches in New York, and the Washington coach was a very grand affair, pale canary in color, drawn by white horses and attended by footmen in livery.

Something of the serious grace of those days lingers about the interior of Saint Paul's. In its dim sanctuary, mellow with age, one feels very far away from the hurrying world, veering around the corner. The pulpit is still surmounted by the feathers of the Prince of Wales, supported by a crown, the only emblem of royalty, it is said, which remains in the city. On the south side of the nave is the pew of Governor Clinton, marked with the coat of arms of the state hanging above it. Directly opposite is the Washington pew, bearing the monogram G. W. Beside it, on the wall, hangs the seal of the United States, beneath which is a wreath sent over not long ago from Sulgrave Manor, the ancestral home of the Washington family, by the British members of the Sulgrave Institution. At the right is a bronze tablet put up by the Sons of the Revolution and the Society of the Cincinnati to commemorate the one hundredth anniversary of the death of Washington, and another at the left, in memory of his inauguration. Even on that day of days the First President turned aside from the excitement and praise of the moment to worship humbly at the familiar shrine.

The most curious decoration of the old church is an allegorical design above the chancel, depicting the solid sheets of lightning which attended the giving of the Decalogue on Mount Sinai. The story is one of the most interesting connected with the chapel.

On Christmas Day, 1775, General Richard Montgomery, then in the flower of youth, stormed Quebec. On the narrow, snow-blocked path beneath the icy cliff he fell, and the enemy, for chivalry had not then passed out of warfare, gave him honorable burial. In 1776 Congress ordered a cenotaph which was shipped by way of South Carolina to avoid capture by the British, and in 1818 Governor Clinton asked permission to remove the hero's body to his native land. As the boat, bearing his remains, sailed up the Hudson, past Rhinebeck, where his bride of 40 years before still lived a widow, it paused and a salute was fired. Mrs. Montgomery had asked to be alone for the moment and her friends found her unconscious.

General Montgomery was buried beneath the chancel window of Saint Paul's and the vestry ordered a suitable monument. But when it was put in place above the Broadway portico, the rough, unsightly stone of the back showed through the stained-glass windows. Colonel L'Enfant, an architect of repute, was called upon to solve the problem, and, after considerable deliberation, a sort of screen was devised on which the awful thunders of the Mount play continually above the peaceful chancel rail.

The peculiarly cosmopolitan character of the city, even in its earliest days, is revealed in striking manner by the graveyard of Saint Paul's. Scotch, Dutch, Irish, French, German, Swede, Hebrew, lie buried side by side, and there are epitaphs in almost as many tongues. And there is a certain decorum about it all that is lacking in old Puritan burying grounds, where impish angels and jovial skeletons disport themselves with small regard for the gravity of their calling. Nor are the epitaphs so startlingly original, but rather keep to such familiar themes as, "Hark, from the tombs a doleful sound!" and the less harrowing, "Death comfortably ends a well-spent life."

The epitaph of George Frederick Cook, of Drury Lane, the first male star to come to America, was written by Fitz-Greene Halleck, and in addition there is this legend, "stone repaired by Charles Kean, 1846; E. A. Sothern, 1874; Edwin Booth, 1890."

Christmas in a Town of Merrie England

A True Record of One Man's Memories of the Yuletide of His Boyhood: The Gleam and Glory of Mankind's Chief Festival

By A. G. WALKER

> **A Famous Christmas Scene**
>
> **At last the dinner was all done, the cloth was cleared, the hearth swept, and the fire made up. The compound in the jug being tasted, and considered perfect, apples and oranges were put upon the table, and a shovel full of chestnuts on the fire. Then all the Cratchit family drew round the hearth, in what Bob Cratchit called a circle, meaning half a one; and at Bob Cratchit's elbow stood the family display of glass, two tumblers and a custard-cup without a handle.**
>
> **"A merry Christmas to us all, my dears. God bless us."**
>
> **Which all the family re-echoed.**
>
> **"God bless us every one!" said Tiny Tim, the last of all.—*Dickens' Christmas Carol.***

WITH the beginning of December the approach of Christmas was definitely recognized. By the middle of the month it had arrived and its departing glories lingered with us until the middle of January. The last week of the Christmas term at college was given up almost entirely to sport, dinner parties and masquerade balls. I am not defending it, I am simply stating history. Traditions of Robin Hood and his Merry Men haunted every part of our community. Sir Walter Scott knew our village well and revelled in its dramatic records. The ruins of the old castle gave wings to his imagination and became the center of one of his immortal books. It was the one thing we held against Oliver Cromwell that he had stormed the castle from the opposite hill so that it had become uninhabitable. But Sir Walter's genius had rebuilt it and filled it again with all the rough life, rough love and dare-devil adventure of feudal times.

It was an established fact that every year on the twelfth of December precisely at midnight a cavalcade of headless horsemen led by a coach and four, driven by a headless groom, emerged from the high, closed and barred doors of "The Hall" grounds and rattled over the macadam of the High street and around the castle and vanished amid the deep shadows of a wood of ageless oaks. As I see it now this annual event was really the arrival among us of the Christmas spirit. In this vague way the Spirit arrived in that coach as it had done for generations. Next morning there was a general attitude throughout our village life as though an important personage had arrived overnight.

The Lordly Beeves of Christmas

WILLIAM RUSHTON was our chief butcher. In front of his shop I met Christmas again. Standing in a heap of straw, with a rug tied over its back to protect it from the biting wind, and halted to a tying post, was a magnificent Durham steer. Around its beautiful neck were tied the ribbons it had won at the Christmas Fat Stock Show. William had given a big price for this animal which had been fed by His Majesty the King. A card printed in large letters and hung from one of the ribbons assured us of this awe-inspiring fact. If the King did not come to see us for Christmas, we had, thanks to William Rushton's enterprise, a distinguished representative. He cannot be said to have borne his honors blushingly but he certainly bore them meekly and, alas, briefly.

Our home was known as Rawson's House. We were not wealthy and it was not a big house. It was a double-fronted, red-brick house with stone facings, standing in its own grounds. The front door was approached by a winding gravel driveway and commanded an uninterrupted view of the castle grounds and ruins. The ivy-covered tower and chancel of the eighth century church were seen from the side window of the drawing room. The river was not visible but we could see the valley and we could see with the mind's eye the water running swiftly and coldly in the depths of the valley. It rarely froze thick enough to allow of skating. Beyond could be distinctly seen the high bluff from which Cromwell pounded the castle with his cannon while his soldiers besieged it on every side. Here on the very spot where our house stood he had had a camp and in the church his cavalry had stabled some of their horses.

Anybody with the ordinary senses of a Christian could have smelled Christmas at three hundred yards from our house at any time within 10 days of Christmas Day. This was true of every house from the squire's to that of the squire's groom.

Christmas Wishes With a Wooden Spoon

"ROWDY, you are just in time for the pudding ceremony," said my mother. In our latitude the twilight that had lasted all day became darkness shortly after three o'clock. My four younger brothers and sisters had come tumbling in breathless and rosy from school. By good chance my father, who had been at Joseph Whitgift's farm sale at Whemby, came in a few minutes later. We were, as the ceremony required, all there. And on the big white kitchen table, the high altar dedicated to soap, sand, scrubbing brush and elbow grease, was an immense wooden bowl. It had been shaped from the solid wood and had served in at least three generations of our family. Christmas pudding not mixed in that bowl would have been a very shortcoming thing. The mysteries that go to making a plum pudding had been carefully selected and to a certain extent blended by mother. The blending had been brought to the point when it was difficult to identify any content. Then mother advanced to the bowl with a large wooden spoon, she closed her eyes, stirred the contents, made her secret wish, then turned and wished us all a Merry Christmas. It was father's turn next to repeat in exact order this ritual. Then each one present, including the lisping infant of two years, followed as mother summoned us by name . . . . Just before it was my turn my eyes met for a moment Mary Hartley's. . . . I gave such a vigorous swirling to the spoon that some of the contents flew over the side and a chorus of voices cried, "Careful, Rowdy, or you'll spill your wish." I heard a merry laugh from Mary and I had surely registered my wish. What would she have done if she had known what it was? However, I fulfilled my office and calmly meeting her merry blue eyes said to her, rather than to the company, "I wish you all (a rather limping 'all')a Merry Christmas and a Happy New Year."

What intense interest was concentrated into the few remaining days. Shop windows were polished and redressed with the red berried prickly holly, and speckled holly, and mistletoe—the latter somewhat sparingly, because imported from Norway at a price rather dear for a slender purse. Still no one would have been content to be entirely without it. Observers of the art of city window dressing would have voted ours a sorry effort. But our tradesmen, I'm sure, had little thought of the commercial element, it was rather their little offering to the spirit of good will.

The men folk had the easiest time. They could suspend any task to tell or listen to a Christmas yarn. However, they did gather up holly and Christmas trees; they also made sure that the Yule logs were plentiful and big enough and dry enough. They must also find the remnant of last year's Yule log. It was the custom, whose origin was lost in antiquity, on the morning after Christmas day to pick out of the fireplace any remains of the log, carefully wrap and store them away for the following year. So when the Christmas fire was kindled, the charred remnants of last year's log were reverently used. Thus a continuity was preserved from year to year. The blazing Yule was definitely linked with that of a hundred or five hundred years ago, and had the religious character of an undying fire.

The Gaffers Have Their Jolly Night

ON THE night of the twenty-third, Christmas began in our house in real earnest. It was our custom, dating from my grandfather's days, to entertain on this night 12 of the oldest men of the village. There was no organization, not even a secretary, all was unconventional. Breaks in last year's company, caused by death or sickness, must be filled and new guests duly prepared and presented. It was not a charitable event, not to us anyway, but a symbol of Christian brotherhood. They walked into the kitchen by the kitchen door at eight o'clock; you couldn't have bribed them to enter by the front door. All were more than 70 years of age. What faces they had! Some were broken physically and one or two were not as bright mentally as once they had been, but most of them were amazingly vigorous, clear-eyed and alert. John Lamsden, the village stonemason, a sturdy, kindly man with a bright grayish blue eye, was one of our guests. John, who neither smoked nor drank liquor, a rare man with us in those days, could talk intelligently about anything that came within the scope of our village life.

There was also Tubby, humorist par excellence. He was the shape of a tub but that was not the explanation of the nickname. In his younger days he had sailed all the seas as a ship's carpenter but finally had settled in his native village as repairer and maker of tubs. Besides, he was often wanted as extra help at the village brewery. Tubby could tell stories with all the lurid lights of a ship's forecastle or all the pathos of a revivalist. Besides he had the gift of discrimination and knew the taste of his audience at a glance. By 10 o'clock that night Tubby was out at sea with all canvas spread. He had a sailor's reserve. While others were laughing to the point of apoplexy, his face showed no change: you might have caught a twinkle in his one eye and a little shuddering at the base of his portly vest. We boys loved to get into his workshop, and learned more geography from him than from the schoolmaster. Church-warden pipes and tobacco ready to hand and a drop of whisky, Scotch or Irish, with hot water, sugar and slices of lemon, for those who needed a warming. In those days you could not get through any arduous task, not even preaching, without a drop to sustain you. Dinner was served on a highly decorated table. The clock struck 12 in the old church tower while they were still eagerly restoring to life and action generations who had long rested in the old churchyard. Those dear old fellows have also gone to the land of silence.

For more reasons than the old men's dinner this was a very important night in our Christmas doings. After dark you might have seen all sorts of almost formless shapes gliding about our back streets and lanes as though they were contemplating theft or murder, or seeking to escape from guilty deeds. This was the night when the spirit of Christmas stole around, to cottages where there was sickness or big families and poverty, with baskets and hampers and bundles. We were a cold-looking people, and maybe reserved in our demeanor, and were proud of it.

The day before Christmas was the decoration of the church, a most important function. It was done with a due sense of following in a line that extended back to the Middle Ages whose achievements had been great though now forgotten. Sister Sue and the Vicar's daughter, a plump and rather severe looking lady of, say, 35, had charge of the work that year. I knew that Mary Hartley would be there, which was the chief reason for my going. Bob Lund was there and Bob was not an excessive churchgoer. Standing at the foot of a stepladder, on which I could distinctly see the trim little feet of Mary, he was diligently passing to her the evergreens and string with which she was garlanding a stone column, yellow and chipped with age. Sue was doing a piece of pretty work on the front of the pulpit, in which some of Cromwell's men had slept. The cold stonework and rough worm-eaten rafters had become things of life and beauty. A few seasonable mottoes were displayed at suitable points. The Vicar said it had never been done better. Laughing and teasing we passed into the village street together.

The Alehouse Choir Preserves Tradition

ELEVEN o'clock Christmas Eve found us a reduced family group around a blazing fire. Father had stolen up to the bedrooms of the children and brought the stockings into the kitchen. These had been duly filled with mingled tenderness and mischief and as surreptitiously restored to their former positions on the bedposts. The Christmas tree was in the center of the drawing room; one dim gas jet alone was burned tonight to allow safe visits of the members of the family who should at intervals steal in and hang their gifts upon the branches. All this had been done. We were a weary, silent, sleepy company, yet we were listening. . . . . Almost together we exclaimed, "There they are." All made for the front door and out into the still moonlight. Clear and strong from the castle ruins came the sound of singing. Male voices were singing the Christmas hymn:

"Hark the herald angels sing
Glory to the new born King
Peace on earth and mercy mild
God and sinners reconciled."

No stranger could have guessed the makeup of this invisible choir. Once they were surpliced choir boys in the village church and had received instruction in the rudiments of music. Grown to adolescence they had slipped out and drifted to the village alehouse. The leader was the proverbial prodigal of the village. He was harmless enough but terribly given to drinking. Straight from the village alehouse, which by legal extension of time for Christmas Eve did not close until 11, they had gone first to the center of the venerable ruins. This was an entirely spontaneous performance. By some strange intuition it preserved a custom, if tradition may be trusted, that Christmas music had not failed annually within those walls for 700 years.

It has always been a curious memory to me, and I can't help wondering even now whether they have pitiful successors continuing the custom.

Alleluia! In Excelsis Gloria!

AT 10:30 on Christmas morning the church was crowded and a minute later all were lustily singing

"Christians awake, salute this happy morn
Whereon the Saviour of mankind was born."

The tremulous voice of the aged Vicar, his hair white with the snow of more than 70 winters, led us in morning prayers and collect. Psalm and gospel were read by the highly respected inspector of schools. From the choir Mary Hartley's voice began: "And behold, a Virgin shall conceive and bear a son and his name shall be called Emanuel, God with us," and the choir chanted, "Unto us a child is born, unto us a son is given, and his name shall be called Wonderful, Counselor, the Mighty God, the everlasting Father, the Prince of Peace." A group of school children sang,

"Once in royal David's city
Stood a lowly cattle shed
Where a mother laid her baby
In a manger for its bed
Mary was that mother mild
Jesus Christ her little child."

Then the congregation sang, "Hark the herald angels sing," reverently received the benediction, knelt a few moments in silence, and left the church as the organist tried the utmost powers of his instrument with the "Hallelujah Chorus." Once outside the church, greetings and introductions of visitors were the order of the day and all this again to the peeling and rolling rhythmic sound of the merry Christmas bells.

The Strangest of England's Prime Ministers

His Be-Quiet, Do-Nothing, Remain-Tranquil Policy Declared a Poser

By W. P. CROZIER

ANDREW BONAR LAW is unlike any prime minister that England has ever had within living memory, and probably at all. To go back a good many years, Disraeli was the actor and the radical, masquerading in the fine clothes of a Tory, but Law is no actor and no radical and the act of masquerade is a thing unknown to him. Gladstone was the moralist and old man eloquent, and Law makes no parade of lofty idealism and has no eloquence. Lord Salisbury was the embodiment of traditional English conservatism with order and caution ever before his mind, but Law is neither English nor even in the old sense Conservative, for it was he above all others who bound the Tory party to the wheels of the revolutionary chariot that Sir Edward Carson drove so violently in Ulster in 1913-14.

No more can one find a parallel to Bonar Law in our more recent premiers. Lord Balfour was in the Salisbury tradition, but he was more of the philosopher, the fine spinner of dialectics, than the downright man of affairs. He was sometimes like the Oxford professor, R. L. Nettleship, who could see so much to be said on both sides of a question that he could never make up his mind which side to take. Law is always the plain, blunt, honest man. Asquith was massive, sonorous, eloquent, using words with great skill to conceal his real intentions. Law not only has no rhetoric, he has no gift of words except such as are absolutely necessary to express most simply the processes of his reasoning.

As for Lloyd George, there never was a greater contrast between two premiers than between him and his successor. The Welshman is mercurial and impulsive, acquisitive of power, dominating and aggressive. The Scotchman is even of temperament and sober in action. In some ways Campbell-Bannerman is the only premier to whom Law bears any shade of likeness. In principles they are the poles apart, for "C. B.," as many say, was "the last of the Liberals," and Law has most affinity with the extreme wing of the Tories. Both might be described as earnest and tenacious Scotsmen of frank and outspoken speech. But Law carries frankness to the point of indiscretion. He thinks aloud and in uttering his thoughts includes those which other men would think but leave unspoken.

"He is an honest fellow," says one man admiringly.

"True," says another, "but he will 'put his foot in it' once a week when he is premier."

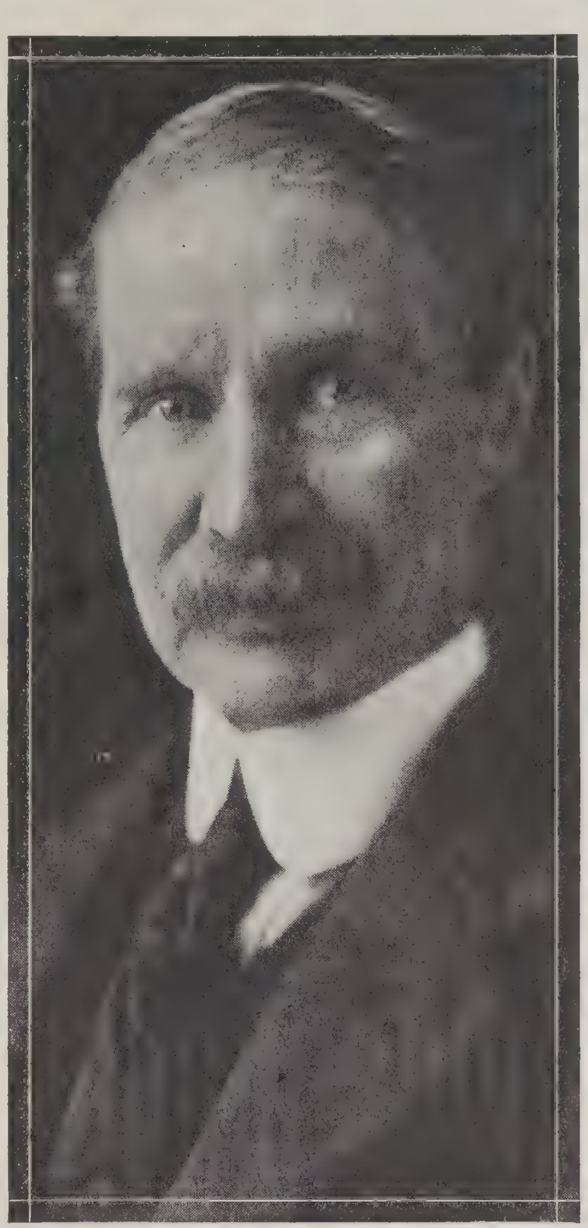
A Glasgow Ironmaster

HIS letter, declaring formally that if France would not co-operate more sincerely with England, England would have to withdraw from Europe and confine her attention to the empire, is not thought, now that suddenly he is premier, to have been the happiest contribution to Anglo-French relations, though many sympathize with it.

Bonar Law was a Glasgow ironmaster and first made a reputation by the protectionist speeches which he delivered as a private member. He was not, like Mr. Joseph Chamberlain, first and foremost a believer in Empire preference; he was just an orthodox protectionist, believing in the virtues of a tariff against foreign goods. In the days when the Unionist party was riven by discussions over free trade, Law's sincerity and practical common sense made a deep impression and when Mr. Balfour resigned and the Tory party could not decide between the clamor of Mr. (now Lord) Long, who represented the old Tory interest, and Mr. Austen Chamberlain, who was the leader of the Liberal Unionists, they compromised on the plain-spoken, hard-hitting Bonar Law. And so he became leader and had to decide where the party stood when the Asquith government passed the Home Rule bill and Ulster organized armed rebellion under Sir Edward Carson.

It would be perfectly true to say that as much as any other man Bonar Law was responsible for bringing Ireland to the verge of civil war. For his part was to place the whole Tory party in England, Scotland and Wales behind the movement of rebellion in Ulster and to promise its absolute support however far Sir Edward Carson went in his readiness, as he himself said, to break all laws. When the treaty with the Sinn Feiners was made by the Lloyd George government some months ago, Bonar Law was no longer a member of the ministry, but he has since expressed approval of the treaty and it was, above all, the support of the treaty by the Tory party which made possible the Irish settlement. The Ulster Unionists, with Lord Carson at their head, stigmatized it as "betrayal." It meant that Ulster's game was finally played out. Had Bonar Law chosen to intervene he could have broken the treaty, which has always been unpopular with the Tory rank and file. Many people, remembering his record in 1913-14, believed that he would summon the Tory party once more to the support of Ulster's wild men. But he had learned a certain wisdom; he knew that the general sense of the country had turned against him. And today, happily, as premier he declares in favor of the treaty. "Our word is our bond." That is one stroke of good fortune for a sorely troubled country.

He has been a great wrecker of cabinets, though he has figured little in the limelight. Twice he has torpedoed Mr. Asquith and once Mr. Lloyd George. In 1915, when the British Army in France was short of shells, Mr. Law told Mr. Asquith, then at the head of a purely Liberal ministry, that he would recommence party warfare against him unless the Tory party were taken into the government. In that way the Coalition was born. In 1916 when Lloyd George revolted against his chief, Mr. Asquith might have dared him to do his worst but again Mr. Law tipped him the "black spot" and told him that his time was up. For the third time now, and this time in the interests of the Conservative party, he has upset the ministerial apple-cart—an astonishing rôle for a man of whom his best friends can only say that he is honest and frank but entirely undistinguished.



(C) Harris & Ewing

ANDREW BONAR LAW

The truth is that Bonar Law has always emerged as a blunt, trustable man just when the Conservative party—and especially the old-fashioned, true-blue section of it—was feeling itself divided and betrayed. It was so in 1915 and it is so now. The world is almost falling about us and we are struggling with desperate problems at home and abroad. Something surely must be done. Mr. Lloyd George made all sorts of experiments and some of them were not very successful. The Labor party says we must nationalize mines and railways, tax the middle and upper "classes" to the utmost and make a great levy on capital. It may all be wrong but at any rate it is a policy. Mr. Law has no policy. He says himself that his policy is negative—do as little as possible, legislate as little as possible, leave things alone. It is not unpopular with his party. After all, that is English conservatism of the old style. But the world is not old style, it is changed, a large part of it in our neighborhood is in ruins—and nothing must be done! We wonder ourselves whether Mr. Law is not after all purely a party politician, for this is not statesmanship nor even intelligence, except perhaps in a purely electioneering sense.

The Policy of Negation

SOME of those who know Mr. Law would say that this sketch has been much too friendly to him, and that he is little more than the average "stupid Tory" raised to power not by merit but by circumstances beyond his control. One such acquaintance has written of him in the *New Leader,* a Labor paper:

"All the ironmongers thought he was a great politician and all the politicians thought he was a great ironmonger—the business man at last arrived. As a matter of fact he has very little capacity for business at all and never made a great success of it. We never got angry with his fertile abuse and violence, because we knew that he would be the first to confess that this was only part of his trade. The dispirited Tory party wanted this sort of thing and he gave it them indifferently and without variety, as a glue merchant ladles out glue or a soap merchant grease.

"One who was in the cabinet with him had told me that he was useless in counsel, partly because he had no ideas, and partly because, if he had an idea, he was never sure whether it was right or not.

"He has never shown any interest in social reform, and, like most of the money-makers of Glasgow, despises the poor except when they are making themselves active in revolt; in which case he hates them.

"Still, he will plod along, with his weak, amiable smile and his weak, amiable courtesy; accepting cheerfully the contemptuous statement of Lloyd George that he was 'honest almost to the point of simplicity'; and killing the fighting spirit in the more violent of his supporters by his obvious dejection, his obvious apology for his own existence, his obvious timidity, in the great post to which time or some 'fostering star' has called him through no fault of his own."

This is a severe judgment and one might reasonably ask how it is that a man so ill-equipped for leadership should be at the head of the historic and still most powerful Tory party. The answer is that, above all, the instinct of the Tory party is to stick together and therefore it wants someone who will put party unity before all other considerations and who will not divide the party like such radicals and democratic Tories as Joseph Chamberlain or Lord Randolph Churchill. Bonar Law is their man. He has no revolutionary ideas, and not many of any kind. He will be content to sit tight, doing nothing and trusting for support to the truly conservative bent of the average citizen. He talks of rest and tranquillity as his goal and ideal during his premiership. But how if events assert themselves and refuse tranquillity? A mere negation, a mere doing nothing, is a pretty poor policy when political and social earthquakes shake the ground beneath our feet.

Colonial Landmarks of New York

Concluded from page 9

The obelisk of the Irish patriot, Thomas Addis Emmet, on the Broadway side, bears inscriptions in Latin, English and Gaelic, and, with an odd mixture of the matter of fact, on the fourth side it records the latitude and longitude of the city.

The stone of one Alexander Thomas proudly tells the world that he was "a native of Boston," and there is a pathetic little slab to "Robertina" without other name to identify her. The Sieur of Rochefontaine, Etienne Marie Bedet, reposes under an elaborate monument with a long inscription in French. Last September, when wreaths were laid on the statue of Lafayette on the anniversary of the Battle of the Marne, earth from his native city of Ay and water from the Marne were poured on the grave of the gallant Frenchman who, in 1782, commanded the artillery and a corps of engineers in the Federal army.

The gates of the churchyard are always open and visitors may stroll through its paths or rest upon its benches. The moment one treads its sward it is as if he stepped on the magic carpet which transports him in a twinkling far from the city's din. By a curious paradox, here, amid the crumbling memorials of past generations, one gains a sense of the worth and permanence of life.

Fraunce's Tavern, on Broad and Pearl streets, is another bit of colonial architecture remaining in New York. Etienne Delaney, a wealthy Huguenot, built it in 1719, and from him it passed to Samuel Francis who opened the Queen's Head Tavern there. Francis was a West Indian and probably a mulatto. During the British occupation a shell pierced the roof and a popular couplet of the day reads:

"At first we thought it was only a sham,
Till it put a hole in the roof of Black Sam."

During colonial days the tavern was the resort of fashionable society and, in 1868, the New York Chamber of Commerce organized there. But on December 4, 1783, occurred the event that makes it a sort of shrine for those who trace the steps of Washington.

In its famous Long Room, on the second floor, the great Commander-in-Chief bade farewell to 44 of his generals, among them Greene, Knox, Wayne, Hamilton, Koskiusko and Moultrie. The last named has left us the story of it in his journal. In silence almost oppressive they ate together, then one by one took their leave of the captain whom they loved. "Such a scene of sorrow and weeping," the account concludes, "I have never before witnessed and hope I may never be called upon to witness again." There is no truer test of a man than the measure of esteem and affection that his subordinates bear him.

On the one hundredth anniversary of Washington's farewell, the Society of the Sons of the Revolution was formally organized in the Long Room. Not long afterward they bought the Tavern and reconstruction was begun. This work was carried on with greatest care. It was necessary to send to Holland to match some of the tiles, and brick was obtained from a building of about the same date in Baltimore. On December 4, 1907, the one hundredth and twenty-fourth anniversary of the farewell, the Tavern was formally opened, and now, in a city where the tide of change runs swiftly, it remains a worthy reminder of the past and especially of our great First President and his steadfast aims.

Minus Plumpness and Laugh—1922 German

Solemn, Contemplative, Is This New Type of Citizen of the Vaterland; Even the Mustache That Curled to the Sky or Caressed Beer Is Gone

By A. R. PINCI

STAND on any street corner in such representative and widely separated cities as Dresden, Berlin and Hamburg, and if you happened to be in Germany 10 short years ago, you will now remark one elemental and quite universal change. The German embonpoint, especially of masculine gender, is gone. One still sees comfortably stout women, but one must squint to find a plump man. If he is found, he remains an exception, and may as well be put down as one of the new Germany's novelties.

With the passing of the said rotundity of body there has passed another ancient German custom; the smile that was laughter. Yes, only a decade ago one could hear it, distinct and sonorous, echoing from countless recesses in old Berlin, in the neighborhood of the Kroegel, or Gartenplatz, northward of Unter den Linden, where the same mirth, in more subdued but no less hearty pitch, announced to the world passing by that to be a German was to be a happy individual.

Today the restaurants and beer houses are full of Germans, but they drink less and they laugh almost not at all. The ancient and honored containers of frothy beer and the two-foot pipes with porcelain bowls are difficult indeed to discover. The latter are not even visible in the tobacco stores. As for beer, I have seen that which 10 years ago would have been deemed improbable; a schoppen of beer unconcernedly left behind half-filled by a modest diner who wanted no more than he had partaken of.

With the embonpoint and the laughter has gone another thing that was considered a sacred Germanic institution; the mustache that curved downward over the lips or the one that shot upward toward either eye. Such mustaches as one encounters are the mustaches that one sees anywhere else in the world. They don't protrude so far as to encounter the foam atop of their pilsener.

There is something pathetic in this outward transformation of the population. A scrawny American or a lanky Englishman or a fastidious Frenchman once upon a time secretly envied the heavy-boned, over-avoirdupoised German whose whole body trembled like gelatine beneath his clothes whenever he laughed. I tried to discover if I could in the course of a swift but extended peregrination the type that was—the middle-aged German reading *Simplicissimus* or the *Tageblatt*, sitting on the edge of a chair out on the sidewalk, smoking quietly, occasionally peering over the page to look, if his contour permitted, at the inevitable dachshund squirming between his huge feet. This man would have a skullcap, sometimes plain, sometimes adorned with a tassel, which crowned a rather huge head superimposing a wide expanse of fancy waistcoat.

If such a man is in Berlin I failed to find him. And if he was not somewhere out in the street, at the accustomed place of places, it means that he must have passed as other types and figures have passed, into memory. What is very likely the case, the man exists, but he is not so stout, he is not so happy, and he is not so prosperous.

It has been said by men who have made a scientific analysis of such matters that so far as reducing overweight the war has been a godsend to Germany. They fear one thing alone; that they may become too solemn. And that is a well-grounded fear. They are overserious. But after all this may prove to be a sign of the times. They are obliged now to do a great deal of thinking for themselves that a paternalistic government used to do for them. The time that they were putting in drinking down heavy beer they are now devoting to the problems of 1922 and the hereafter.

A Five-mark Premium

THEATERS like the Komische Oper, or the Komödienhaus am Schiffbauerdamm, where musical comedies are given, or the variety houses, are doing a fair business, but the opera and the Theater in der Königgrätzerstrasse, where the wonderful "Geschichten des Kapellmeister Kreisler" is presented with the new stage system, are patronized to standing room.

The desire to attend a performance at the former royal opera house came upon me 10 minutes before the performance was scheduled to begin, and I hurried thither with a taxi, but it was seven o'clock, the doors were being closed to shut out the street noises, and the curtain was drawn across the box-office window. Not a seat! I tried to wheedle and cajole, but nary a ticket. I was anxious to see the Magic Flute and so I commenced to move about so as to reveal to him, if such a person happened to be about, that speculating against me in the sale of a ticket would have been good business. But no speculator appeared on the scene; only a few stragglers: when each in turn knocked at the window, the man within would say *Nicht*, the patron outside would repeat *Nicht*, and after three or four *nichts*, it was agreed and understood that nothing in German theaters means nothing—even out on the sidewalk.

For once I appreciated the ticket speculator as an institution. The highest single place cost 400 marks, or exactly 33 cents, and I felt that I could multiply this sum by 10 and still get my money's worth. The principle may have been wrong, but it was drizzling outside and the evening was long and they were singing within. What was 4,000 marks under these circumstances?

And as I was brooding thus a gentle voice said something to me in German. It was an inquiry. He wanted to know if I wanted to buy a ticket. Did I? It was not the price that I was worried about, however; it was the fear that drastic German law—the ancient and inexorable Verboten—might cause me trouble, and I said as much. The sale was subject to a warranty of admittance. He would convince me through no less a personage than the ticket seller. But the latter proved to be useless; he retorted that he did not care to say anything about it. So we went to the doorkeeper—not the inside one, but the six-footer in a frock coat and gold braid and brass buttons and a decorated cap. He assured me the sale would violate no rule, but that it could not be made within the lobby. So we stepped out into the street, where I was prepared for the worst. How much?

"Hundred-sixty marks!" It was the third gallery, but the ticket was right over the former imperial box. I saw its location on the diagram hanging on the wall. And the box-office price was 155 marks, extras included. Now a five-mark premium on an opera ticket is rather unbelievable, but that is what I paid and the seat so located that at the box office I should have paid 10 times the price, if need be, without a murmur. Now this story ought to stop right here, but to show that foreigners are not always tricked the sequel is more important.

As the usher preceded me upstairs he calmly informed me that that was his ticket. I began to feel foolish and almost self-conscious about it. After double precautions had I been sold a ticket of doubtful title? Happily that was not the case. The ticket had been given to the man who sold it to me by the usher, and the recipient thereof did not want to go and decided to sell it, giving the donor 20 marks out of the "80 marks he got for it." Yes, 80 marks, because "sold after the performance had started." Without thinking I assured the usher that I had paid 155, whereupon he muttered some nice adjectives in German which in essence conveyed the information that if that man ever received another complimentary ticket it would be over the donor's dead body, or something like that. I assuaged his grief with a 50-mark note, for which he chased downstairs to steal a program from some careless person, because there was not another to be had for love nor money.

A Visit to a Coffee House

NOW here was an instance of German tricking German, notwithstanding my suspicion, afterward abandoned, that it was a sob story to extract *funfzig* marks or so from a kind-hearted stranger. I dread to imagine what would happen to a "rich" foreigner eager to enter if he lolled in the lobby of the Metropolitan in New York. I have been asked $10 for an even exchange on a $7 seat, and that was supposed to be a modest fee.

The performance was interesting, but the audience was even more so. Berlin, to my recollection, happens to be the only city where an audience actually holds its peace until the curtain is nearly down before it applauds, and doesn't annoy any one by deafening noise in the haste to show "appreciation" when the tenor hasn't finished his little piece. The applause was unstinted but not extravagant and certainly well intoned. The opera being allegorical and in parts comical one expected much laughter—but I have already said that the Germans are not laughing any more, not much.

We were in the street before 11 o'clock. So I hied me to the Vaterland Kaffee Haus, in Potsdamer Platz. I had been there the evening before but I wondered if Sunday night might reveal a differing attitude. It's a huge hall, where beer, coffee, ices, liqueurs and sweets are served. A wonderfully good orchestra plays on a balcony, in the glare of thousands of electric lights. It is not a place for and of the rich. Anything but that. It is a tarrying place for the everyday German; one sees young couples and solitary men and elderly persons and whole families. One takes the seat that most suits, regardless of who happens to occupy the other space, for each table means four chairs. Men salute each other gravely, silently, raising their hats solemnly, a bow of askance on the one side and of acquiescence on the other, as a matter of form and of courtesy. It may mean the first step to an hour of conversation and it may mean nothing more than an occasionally stony stare.

In other words, this Kaffee Haus is what we would term a popular amusement resort. One would expect at such a place the latest jazz music. But not so. It was classic after classic; chamber music, symphony, cavatina, waltz. Dancing? Nary a step. In the United States a resort of this kind that did not cater to dancers would have to close within a week. But one and all, the men and women present were passing the time quietly, modestly, economically. Laughter? Nary a bit of that, either. At least, it could not be called laughter. And as for giggling, the thing does not exist.

Tall conical glasses are used for beer, and I noticed that a beer order is not worth, evidently, the compliment of a tray, because three or four glasses are brought between the fingers, but if you get a cup of what is called coffee then you get with it several trays. In order to disguise the taste I have been obliged to order several "zuchers" because one portion of sugar would intensify the insipid flavor of whatever it was they served me. Every such extra zucher was duly marked down and charged for. One may hear, in this wise, three dollars' worth of a miniature philharmonic orchestra rendering choice programs for about 30 to 50 marks, depending upon whether one takes coffee, beer or a liqueur.

I dined on one occasion in style in one of the fashionable Unter den Linden restaurants. The feast cost me slightly more than 800 marks, or 70 cents, which included a very good native wine. Surprising as it may seem, one is safer in ordering native wine in Germany and getting unadulterated juice of the grape than would be the case in wine-producing countries like France and Italy. I refer, of course, to ordinary wines; not the liquids that depend upon labels, vintage year, temperature and chromatic glassware.

The self-contained attitude of the Germans of today may or may not mean anything with regard to the fortunes of the nation. One thing is beyond doubt; they are annoyed by the vast numbers of foreigners swarming the Vaterland. It is not the visitors, with certain exceptions, that they object to; it is the spirit with which they come. It is patent that they would prefer fewer visitors.

The most amazing side of German psychology is their utter indifference to the French—an indifference that pains the Gallic observers more than would a cordial hate. I may be wrong, but as I see it the German today still regards the French with tolerance and on their part the French feel the very thing that the Germans want them to feel.

It were a brave observer who would hazard with finality an opinion about the German idea of government. The republic is now more than three years old, for one should not consider the semi-chaotic year that followed the kaiser's flight to Holland. President and chancellor are holding forth patiently but firmly. There are rumors of impending disaster, politically, and there are occasional economic plunges, but as a country, and particularly as a people—which is more important—everything runs smoothly.

One enters a bookstore, an art shop or a post card emporium. On every side one sees books about German history, past and recent; biographies of the dynastic personalities so dear to the Teutonic heart. There are etchings and lithographs and photographs of the imperial family and of all of the princelings. The post card shops sell a large quantity of likenesses of the Hohenzollern family, and even at this late day find ready sale for *in memoriam* cards of the late kaiserin. Does it mean that the dynasty is still supreme in the German idea?

It might be possible that such a condition was the result of careful propaganda by the adherents of the throne and that it served the ends of that group that is actively, if quietly, engaged in the attempt to restore the monarchy. If you have asked your taxi driver or German guide to point places of interest you may remember the vim with which he indicated the Siegesallee, or avenue of victory, with its equidistant monuments flanking both sides, forming semicircular recesses against the Tiergarten's foliage. There are more than 30 such monuments of German rulers representing all the reigning members of the Hohenzollern dynasty from the Middle Ages. No matter where you turn, there is a statue of some German hero, from civil or military life, confronting you. In the face of such ubiquitous reminders, it is well-nigh impossible to eradicate from the German mind the puissance of the men who wrought Germany—and Germany is still Germany. The war has not altered the Germany that the Germans know. They no longer regard the military as infallible, but they are yet proud of their country, which is as it should be. It is that very pride that augurs well for the future of Europe, because it presupposes an undying spirit and an indomitable will. It is well to recognize these two traits and to say that they exist.

No Parading Being Done

UNLIKE Paris or Vienna, Berlin makes no attempt to dress up Unter den Linden as its chief boulevard in an exclusive sense. Although it is regarded as an exclusive avenue it is full of Germans that are not on parade. If you have been in Germany did you notice or not that no place in Germany is on parade? That no one dressed up to be on parade? That no false atmosphere has been created for the benefit of outsiders? That there are no silk stockings?

The average American or other foreign visitor cannot obtain a true picture of Germany or penetrate the German mind by tarrying at the Adlon or the Esplanade. It cannot be done by looking up fellow countrymen, getting together for a party, going to see the sights, and keeping up this monotonous program. Yet that seems the best that the investigators from overseas can undertake. No one walks away from the beaten path. No one will take trouble to go upon the very legitimate and engrossing errand of perambulating the city while it sleeps, to watch the fleeting cab, to submit coldly to the once-over by a German policeman who seems tempted to ask what your business is and then passes on. That is the time when derelicts appear according to romancers, but Berlin is shy on nocturnal wanderers. Those one meets are evidently bent upon some errand or are hurrying home. The droschke follows you, because the driver cannot understand why any man should want to foot it if he has money, and horse-cabbing is very cheap.

Money as Weapon Conquers Seminoles

Only Indian Tribe Refusing to Recognize the Government Succumbs to Offers of Work

By OLIN W. KENNEDY

Seminole family canoeing through the Everglades.

SEMINOLE INDIANS are beginning to realize the value of the American dollar. They are turning from fishing and alligator hunting to daily toil for the white man.

Long reputed as the only Indian tribe refusing to recognize the American Government, the Seminoles have, within the past year, changed many of their customs and, while they continue to pretend contempt for the government at Washington, they are mighty glad to take jobs with white men which will yield them American currency.

Pleased to call themselves "the only unconquered Indians in America," they really have been conquered by the power of money.

For many years the Seminoles have been content to obtain their living from the sale of fish caught in the Everglades and dried under the hot Florida sun and by trapping alligators and selling them alive to the alligator farms. They also raised some grain and vegetables for home use, but in later years they have shown such a fondness for canned goods that they preferred to abandon gardening and devote their energies to fishing and trapping. Now they have taken up day labor for the whites.

Lucien A. Spencer, for many years dean of an Episcopal cathedral, but who has been an Indian agent for a long time, has just completed a trip to all the Seminole Indian villages. He reports that the Seminoles are not only taking to labor but that they are relinquishing their tribal forms of government and, saddest of all, that their moral standards are falling.

For as long as white men can remember the Seminole women have been extolled for their constancy and their intense devotion to the men of their own race. Recently there have been exceptions to this reputation.

As indicating how tribal laws are collapsing, it is said that little attention has been paid to moral lapses. Not long ago, when such offenses were extremely rare, it was the custom to sentence the offenders to self-inflicted death. They were commanded to go deep into the Everglades and die by starvation or by the bite of the rattlesnake or some other poisonous reptile. As the three more serious offenses the past year occurred among Seminoles who had gone to the towns, it may be taken for granted that had the offenders returned to the Everglades some kind of punishment might have been meted out, but probably not the death penalty of the past.

In taking up white men's work, the Seminoles also are gradually discarding their picturesque apparel for "store clothes." A young Indian named Willie-Willie is said to have led the way from the Everglade varied-colored costume to white men's clothing. About two years ago Willie-Willie blossomed forth in the most stylish clothes he could buy in a men's shop in Miami. He became a real Beau Brummell and as such was made much over in the Florida resorts. Willie-Willie's success turned the heads of the young bucks back in the Everglades and one by one they have started wearing clothes of the famous advertised brands. The women were slow to change but here and there squaws have adopted modern dress. Quite a number of the Seminole girls have sought housework in the towns that they may dress like white women.

The older Seminole women last season started to work in the bean and tomato fields. The Seminole has never given a great deal of attention to education and as a result only a few have the ability to read and write. Denying themselves the privilege of becoming wards of the government, through their deep-seated feeling of injury at the hands of the whites in the early days, no system of compulsory education has been possible. Occasionally a chief would insist on his children learning to read and write. There is some difficulty in handling the Seminoles as laborers. They have no sense of time nor of figures. It is necessary to pay each woman bean or tomato picker as each hamper of vegetables is brought in. If they pick twenty hampers a day they necessarily must be paid twenty times a day.

Agent Spencer says that the Indian lack of sense of time is illustrated by the fact that if one of them is told to drive a drove of hogs 80 miles the hogs will each weigh five pounds more at the end of the trip than at the beginning, for the reason that the Seminole will take several days to make the drive and allow the hogs to forage on the way, whereas a white man would hurry the trip through and the hogs would weigh several pounds less at the end of the trip than when they started.

Common labor was scarce for a time this autumn in Miami when considerable work was necessary in building new golf courses. The contractors appealed to Willie-Willie, the Beau Brummell of the Seminoles. He fared forth in the Everglades and brought back a number of young bucks. They proved good workers with pick and shovel. As a result Miami has probably the one golf course in the world made by Indians —"unconquered" Indians, at that.

Seminole Indians have always been held in high esteem by the white people of the east and west coasts of Florida. A Seminole has never been known to lie. His word is his bond. They have been trusted by storekeepers in many towns and although the accounts might be allowed to run three or four months and often a year, the Seminoles would finally come in and pay in full.

A Seminole hunter.

LUCIEN A. SPENCER,
Indian Agent in charge of the Seminoles in Florida.

Willie-Willie, the Beau Brummell of the Seminoles. He was the first to wear white men's clothes. Other young bucks "like his style" and are going to work to buy clothes.

A Seminole bridal procession. This procession was led by Chief Jack Tigertail, who, a few days later, was assassinated by a white man. The bride is at the side of the chief; the groom is following.

Last winter a Seminole sub-chief named Jack Tigertail was assassinated by a white man. Jack left a squaw and seven children. The white people of Miami raised $1,600 as a trust fund for the widow. There were three contributions of $100 each. This fund is in bank and it is estimated that it is sufficient to supply food for the widow and her younger children for at least 10 years. According to Seminole mourning custom, the widow has worn her hair down over her shoulders for a year.

The slain chief was the first Seminole to be buried in an established white cemetery. His favorite gun was laid on the casket and at the head of the casket was placed a box containing all his jewels and trinkets. Many white persons attended the funeral.

Until recently it has been difficult to obtain a correct census of the Seminoles in Florida. Agent Spencer explains that it was only a short time ago that he discovered the reason for this. It was that on the east coast a Seminole had one name and had another name on the west coast, and perhaps a third name out in the Everglades. Agent Spencer finds that there are now 467 Seminoles in the state, an increase of 10 in one year.

Notwithstanding the Seminole defiance of the government, the Department of Interior has set apart three reservations for them in Florida. The largest, in Lee County, consists of 22,400 acres; the second in Palm Beach County, 1,900 acres, and the third, in Broward County, 300 acres.

The inclination of the Seminoles to take white men's work, in the fields and nurseries mainly, may relieve the government of the necessity of appropriating large sums for their maintenance, but Agent Spencer is of the opinion that the government will be required to give considerable attention to them for many years—at least more attention than in the past four or five years. He fears that many males may take up life in the towns and cities and leave their families in the Everglades. This will mean that the aid will have to be given the squaws to keep their children. The slacking in morals also gives him concern and leads him to believe there may have to be closer supervision.

Agent Spencer is of the opinion that if the Seminoles are to be kept in tribal control and not scattered in small groups it will be necessary for the government to appropriate enough money to establish herds of cattle and hogs on the Lee County land. The land is adaptable and the Indians take interest in that work.

Clear View of the New Status of Ireland

Famous Catholic Economist. Returning From a Tour of Study, Gives Illuminating Outline of a Vexed Question

By REV. JOHN A. RYAN, D. D.

THE constitution of the Irish Free State has been adopted by the Irish Provisional Parliament, sitting as a constituent assembly and ratified by the British Parliament. On December 6, it went into effect without further formalities, and the Irish Free State was fully established.

The constitution sets up what is known as the parliamentary system of government; that is, the executive will be elected by the chamber of deputies and be responsible thereto, as in England, France, and most of the countries of Europe. It includes a liberal form of the referendum, and provides for the establishment of the initiative either by the Parliament, or by the people, in case Parliament fails to act in the matter. Perhaps its most striking feature is the nature of the Senate. The members of this body will be elected by the voters of the whole 26 counties acting as a single constituency, and the senators are intended to represent conspicuous national achievements and the important classes of the nation. The senate will have no power except advisory over money bills. Other bills passed by the chamber of deputies the senate can delay for 270 days if it does not endorse them; or it may require them to be submitted to a popular referendum.

The Powers of the Irish Free State

THE feature of the constitution which is least acceptable to the majority of the Irish people is that which lets in the British King. Through his representative in Ireland, the governor-general, he is empowered to veto bills passed by the Parliament, or to reserve them for consideration before giving his approval. However, this power is an empty form, inasmuch as the royal veto and royal reservation must be exercised "in accordance with the law, practice and continual usage prevailing in the Dominion of Canada." This means that there will be no royal veto nor any reservation of bills for a possible royal veto; for nothing of the kind happens in Canada. The governor-general is also authorized to appoint the members of the cabinet, which is to be known as the executive council, the heads of government departments, and the members of the judiciary; but in all cases he is required to appoint those who are nominated by the chamber of deputies or by the executive council. In other words, the King will exercise as much actual power in the legislative and executive departments of the Irish Free State as he exercises in Great Britain or Canada—which is exactly none at all.

Not all the powers of the Irish Free State are set forth in the constitution. Some of the most important subjects of legislation are dealt with in the treaty which was approved by the *Dail Eireann* December 6, 1921. It is in the treaty that we find whatever restrictions prevent the Free State from being completely independent. These give Great Britain facilities in certain harbors when she is engaged in war. With this reservation and with the further reservation that apparently the Free State will not send diplomatic representatives to foreign countries, the Irish Free State does not differ essentially from an independent republic. Its government will be able to do anything that can be done by the government of any sovereign state for its people in the fields of finance, industry, education, morals, religion, politics and general welfare. Indeed, it will be able to enact laws for the benefit of the laboring classes, which neither our separate states nor our Federal government could enact without a change in our Constitution. In this connection, it is worthy of note that the provision in the Free State constitution for its own amendment is more liberal than similar provisions in either the national or the state constitutions of the United States. A majority vote of the two Houses of Parliament is sufficient to submit a proposed amendment to the people. For the amendment to be adopted and to become a part of the constitution all that is necessary is that (a) a majority of the electors should vote on the proposal, and (b) either a majority of the electors or two-thirds of those voting should record their votes favorably.

Then, Why the Continued Trouble?

SINCE the Irish people (except the inhabitants of the six northeast counties) will soon have a state which is a republic in everything but the name and a government which can do practically everything that any people wants a government to do, how comes it that a minority has for several months been in active rebellion against their own government? The answer is, of course, that these men dislike the continuation of the British connection, and want their country to be completely independent. They think that the status of the United States is preferable to that of Canada, and they are so intensely attached to this preference that they are willing to make their country a desert rather than accept the Free State. More than three months ago, it was estimated that the damage done by the insurgents to the civil and economic interests of the country was sufficient to provide a decent dwelling for the many thousand inadequately housed families in the Irish towns and cities. Since then, the work of destruction has been greatly increased. The Irregulars burned a condensed milk factory in Tipperary which employed 250 persons, and was the main industry of the town. I myself saw the ruins of the admiralty house, the barracks, and the military and naval hospital in Queenstown, all wantonly set on fire by the Irregulars as they were leaving that city. These are only samples. Wherever the insurgents were in control, they indulged in the same criminal acts of devastation. In the words of the recent pastoral letter of the Irish bishops: "They have wrecked Ireland from end to end, burning and destroying national property of enormous value, breaking roads, bridges and railways, seeking by this insensate blockade to starve the people, or bury them in social stagnation. They have caused more damage to Ireland in three months than could be laid to the charge of British rule in so many decades."

The insurgent forces are composed of various and contradictory elements. Apparently the leaders are, for the most part, sincere fanatics. The same may be said of a considerable portion of the rank and file, but probably the majority of the latter are either adventurers, loafers, the intermittently employed, or actual or potential criminals. The numerical strength of the insurgents is very difficult to estimate because it has not only varied in different months since the fighting began, but it varies even from day to day. Between 6,000 and 8,000 of them have been incarcerated by the Free State Government in various prisons. A recent estimate places the number of those who are still in active rebellion, at least now and then, at seven thousand.

Insurgents Are Tories, Not Democrats

ALL the insurgents and their supporters in Ireland admit that the vast majority of the Irish people want the Free State, rather than any further attempt to get absolute independence by fighting Great Britain. When I was in Ireland the lowest estimate that I heard of the proportion of the people in favor of the Free State and against the insurgents was 85 per cent; the highest was 98 per cent. That was last July. With the increase of the destruction perpetrated by insurgents, the percentage of the people opposed to them has likewise increased. It is now at least 95 per cent.

How do the sincere fanatics among the insurgents attempt to justify their opposition to the will of the majority, and their repudiation of majority rule as a political principle? Partly by shallow sophistry and partly by invoking the principle of toryism. They contend that the majority have accepted the Free State under "duress," that is, through fear of a renewal of British warfare in case they should refuse to accept the treaty. Of course, the "duress" is very much exaggerated by the so-called republicans. The degree of freedom and political autonomy obtained through the treaty is so much greater than the vast majority of the people had ever hoped to obtain that their acceptance of the treaty was to a very high degree spontaneous, and with very little consciousness of duress or compulsion. In any case, every genuine democrat believes that the people have a right to choose between such alternatives as are offered them. If they regarded the treaty as an evil and the alternative of renewed warfare with Great Britain as an evil, they must on democratic principles be accorded the right to choose between these evils. The man who refuses to abide by their choice in such a situation is not a democrat, but a tory, for he acts upon the tory principle that the superior minority has a right to dictate to the "unthinking" or the "cowardly" majority.

An Inside View of Irish Political Tricks

VERY few of the insurgent spokesmen are honest enough to admit that they are, in reality, acting upon tory principles, by arrogating to themselves the custodianship of the majority. Most of them fall back upon a sophistical technicality. No formal vote, they contend, was ever taken by the Irish people on the question of accepting the treaty. One answer is that the people elected last June the members of the present Dail, or Provisional Parliament. Of the 120 odd persons chosen, some 86 are in favor of the Free State, and have been meeting regularly since the ninth of September. It is they who recently considered and adopted the new constitution. Although the people did not vote on the treaty itself, they voted for a majority of pro-treaty representatives. They chose some 30 independent candidates, labor, farmer and other, every one of whom is for the treaty and defeated a candidate opposed to the treaty. Had independent candidates offered themselves in all the constituencies previously represented by anti-treaty members, it is practically certain that not five of the latter would have been elected. The relatively small number of anti-treaty men chosen at the June election owed their success at the polls to two facts: first, the Collins-DeValera Pact by which pro-treatyites and anti-treatyites agreed not to put up candidates for the places then occupied by their respective opponents; second, the failure of men to enter the lists as independent candidates in many of the districts represented by opponents of the treaty. In brief, the people went as far as they were permitted to go in declaring themselves for the treaty.

Why was not a plebiscite held on that precise issue? Because the Irish republican army, then controlled by the anti-treatyites, had openly declared that it would not permit such a plebiscite. The excuse was that a new register of voters should first be made to admit those who had come of age since the last election in 1918. But there was not sufficient time for this, since the Dail had bound itself to consider and adopt a constitution and take all other steps necessary to set up the Free State before December 6, 1922. The so-called republicans were well aware of this difficulty; hence their demand for a new register of voters was merely a subterfuge to gain time and make the carrying out of the treaty impossible. Their insincerity in this demand was shown by their refusal to permit a popular vote on the treaty which vote was to be recognized by both parties as having no legal binding force. The party favoring the treaty proposed this arrangement as a means of determining how large was the majority willing to accept the treaty. They knew that the majority would prove so overwhelming that even if all those not on the register but otherwise qualified were to be regarded as opposing the treaty, a plebiscite on a full register would still show a great majority in favor of ratification. The anti-treatyites were likewise aware of this situation; hence they were resolved to prevent by force even this informal and informative kind of plebiscite.

The Attack Upon Free Speech

ANOTHER indication of the contempt for democracy and its institutions entertained by the so-called republicans is seen in their treatment of the *Freeman's Journal*. At one of the meetings of the executive council of the army in Dublin, before the provisional government had undertaken any military action, it was decided that the army should not take orders from the provisional government. As is well known, that government had been created by a majority of the Dail Eireann. Although these army bosses were setting up a military dictatorship, they had not the courage to let their action become known to the public. When the *Freeman's Journal* got hold of and published a copy of the resolution adopted by the army executive, the latter raided the *Freeman's* printing establishment, and destroyed more than $200,000 worth of machinery and other property.

One of the most widely circulated falsehoods perpetrated by the so-called republicans is that the provisional government attacked them in the Four Courts building, thus beginning the civil war, on the written order of Winston Churchill. No evidence is ever offered of the existence of any such written order. Of course, no order was necessary. No government with any self-respect, or any expectation of functioning effectively, could have long tolerated defiance by an armed force occupying one of the public buildings. Some of the apologists for the so-called republicans profess to believe that a reconciliation would soon have been effected between the recalcitrant army and the provisional government. All the evidence negatives this assumption. As a matter of fact, the provisional government moved against the Irregulars in the Four Courts at the time that it did move for the very good reason that it had learned of an impending attack by the Irregulars upon the British forces that had not yet gone out of Ireland. The object of this dastardly plan was, of course, a renewal of war with the British Government, and a repudiation of the treaty which the representatives of the people had adopted several months before. In other words, the provisional government had to deal, and deal promptly, with the attempt of a military dictatorship to violate the national faith, and set at naught the will of the people.

An Armed Minority Coerces Majority

TO PUT the present situation in a few sentences: An extremely small minority of the Irish people is in armed rebellion against the majority. Their methods are those of what is known as guerilla warfare, developed, or degraded, to a level of criminality and recklessness that has seldom, if ever before, been reached. The apparently wanton and senseless destruction of public and private property has been carried on from the beginning on the theory of "making government impossible." In plain English, this means to make not only government but normal economic life impossible, with the hope that sooner or later the outraged and impoverished people will turn in sheer despair to the insurgents, crying, "Take charge of the government yourselves, take anything you want; only put an end to this horrible devastation." If the Irish people could be coerced by such diabolical persecution, they would necessarily have become a different people from the generations that resisted the British oppressor for seven and a half centuries. But they will not submit. The insurgent forces are now merely isolated bands who are kept out of the cities and whose principal exploits are the occasional destruction of roads, and plunder of shops and banks. Within a few weeks, these performances will have ceased to be formidable either in number or in effects.

Memorializing World War Conflicts in Maps

More Than 200 Scenes of American Triumph and Sacrifice to Be Marked

By S. R. WINTERS

THE battlefields of Belleau Wood, St. Mihiel, Meuse-Argonne, Meuse-Aisne, Cantigny and other blood-drenched areas in France, Belgium, and Italy, are to be marked with enduring memorials commemorative of the valor of American soldiers. The recommendation of President Harding to Congress that legislation be enacted creating a Battle Monuments Commission gives definite cast to the project. Plans have been formulated for placing suitable markers on battle scenes.

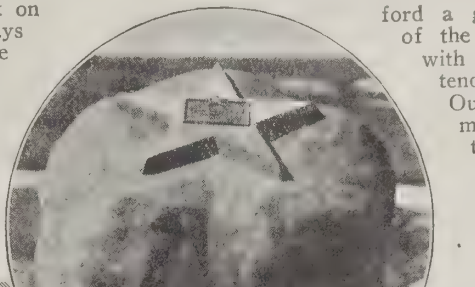
The undertaking will require more than five years and will involve an aggregate expenditure of $538,103. A Congressional appropriation of $125,000 will suffice in conducting the operations of the first two years. Eighty relief-map monuments, 50 outline sketch memorials, 12 special monuments, 10 tablets, 3 large index maps, and 50 replicas of small-scale maps, are the variable forms of markers which will serve to identify the battlefields where the American contingent fought. The legislation creating the Battle Monuments Commission likewise vests it with authority to make photographs of the grounds on which American blood was shed. The project had its inception with the Federal Government. The original legislation was drafted in the War Department by the Battle Monuments Board, of which Colonel John McA. Palmer is president and Xenophon H. Price is the executive officer.

The Battle Monuments Commission, in the formulation of plans and estimates for memorializing the areas traversed by American soldiers, was without a chart or trustworthy guide from experience of other wars. The Civil War gave no precedent. The commission, however, did not overlook the opportunity to investigate the Civil War markers. The composite opinion of this commission is that the respective memorials were influenced by the wealth of the individual community and the military organization it supported. Obviously, the completed system was conspicuous for its absence of unity of design. The story of the visitor to the battlefield of Gettysburg whose impression of the memorials of that military engagement reflected the viewpoint that it was waged between the Confederate states and the state of Pennsylvania illustrates the confusion arising from the absence of a unified system of marking battlefields.

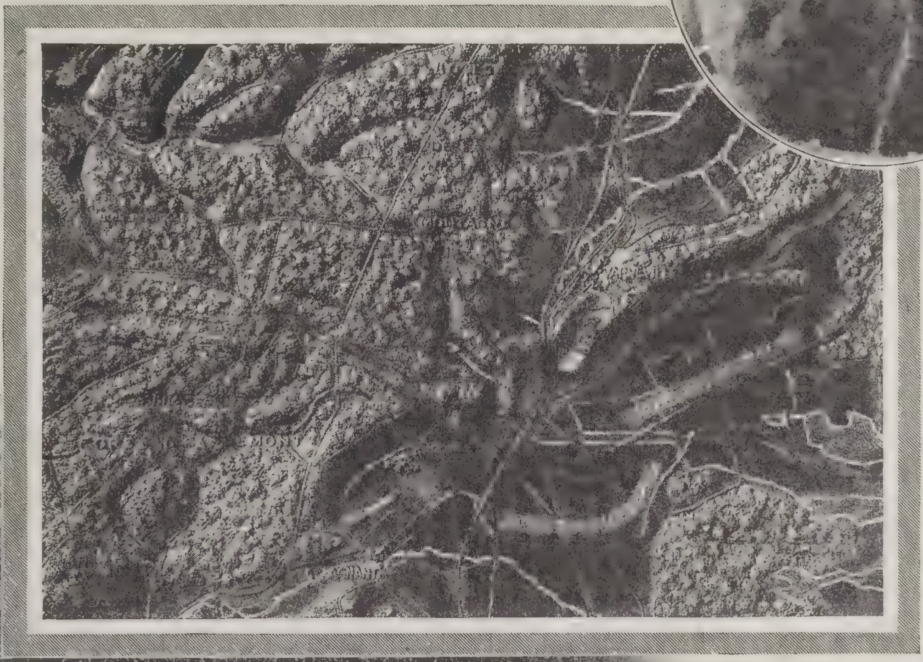
The Battle Monuments Commission in its activities in France will be guided by well-defined principles. Uppermost among these are that the project shall be a national undertaking, fostered solely by Congressional appropriations, and each battlefield shall be accorded the treatment which the significance of the particular military engagement merits. "Dignified simplicity," is the term employed by the commission as the objective which shall be constantly in mind in its creation of memorials. Expressed recognition of the beauty of existing French monuments and the inability of America to compete with these in the absence of lavish appropriations partly determined the pursuit of a policy where dignity and simplicity would be economically combined. The atmosphere surrounding the Washington Monument offers a pleasing model and one in which the American spirit is typified. Then, too, when memorials are being perpetuated on foreign soil, modesty in its attitude toward achievements should characterize the claims advanced in maps, bronze, or what not.

The usefulness of the particular monument to be erected is stressed in the plans of the Battle Monuments Commission. Historical significance should determine the placing of the marker—in other words, a minor military engagement should not be magnified by placing a memorial out of proportion to the real achievement. The spirit of letting each triumph speak for itself is regarded as a policy conducive of enduring recognition. The information on the monuments will be marked by clarity—where comprehension by the tourist is possible even though he has scant knowledge of military history and military science. The text on the memorials is to be supplemented in other ways to explain battlefield history. Pamphlets will be prepared indicating the location of all monuments and setting forth data relating to the military operations.

A monument containing a relief map is a novel conception. The relief map, in fact, is to form the central theme of the over-sea memorializing project. The application of an oriented map on a monument is not of fresh conception; a striking illustration being found in the map of the city of Washington on the monument to L'Enfant in the Arlington Cemetery, Arlington, Virginia. Similarly, the use of maps in memorials is on the walls of Langres in France and in observation towers of battlefields of the Civil War. However, now for the first time a relief map is to be employed as the outstanding feature of a monument. This map will be a veritable sightseeing bus to tourists, indicating as it does the maneuvers in battle which took place on the soil included in this map.



Battlefield marker erected by Second Division northwest of Somme Py.



Relief map which is essential feature of projected battlefield markers.

Marker erected by First Division.

The map will be cast in bronze, a model having already been constructed by the Engineer Reproduction Plant of the War Department at the Washington Barracks. The daily battle lines and the designations of the American troops according to military divisions will be portrayed. The scale will be 1/20,000, and each unit will embrace a section of about 8 by 10 kilometers. Portions of the map are to be ornamented with colored enamel, bringing out outstanding objects. The combination of bronze and enamel will require experimentation, although experience of museums is that relics thousands of years old have been preserved thus. A solid stone block, the top surface of which embraces a larger area than the map itself, will serve as a support for the map. The face of the supporting block will have inscribed thereon the national coat of arms and the words, "United States of America."

Relief-map monuments will be planted at points in Europe where the American contingent either sacrificed or gained ground positions. There will be 80 in all. Prominence and accessibility to tourists are factors that will determine the exact locations. The model of the memorial has received the approval of the National Commission of Fine Arts.

Front battle lines along which troops from the United States trained or occupied sectors will be represented in enduring form by outline-sketch monuments. One will be erected for each division for each time it occupied a more or less stable portion of the front line. The distinctive thing about this design of marker will be an outline sketch-map in bronze, scale approximately 1/40,000. Other than on the front, this representation will indicate the towns, waterways, railroads, and principal highways in the territory which it purports to outline. The purpose of such inclusive features is to afford a general orientation of the front battle lines with respect to its attendant conditions. Outline-sketch monuments will be stationed at accessible points, probably in proximity to divisional headquarters. Tentatively, the number of these monuments to be erected is 50.

Markers will identify points of historical significance where relief-map or outline-sketch monuments cannot be appropriately erected. The spot where the first American soldier was killed in Europe will be appropriately marked as well as the place where the first American soldier was wounded. Other events in the world-wide carnage to be suitably signalized are: The area of the raid by German troops or the first division of the United States Army on November 3, 1917, during which encounter the first American soldier sacrificed his life and the first American soldier was captured; the soil on which the Eleventh United States Engineers fought at Cambrai; the sector which was held by the Sixth United States Engineers during the German offensive of March 21; markers commemorating the signal activities of the 369th, 370th, 371st and 372nd infantry regiments which served with the French; a point near Casarsa, Italy, where the 332nd United States Infantry was engaged; a marker at the town of Hamel, indicating that units of the 33rd Division assisted in its capture on July 4, 1918. Designs for these miscellaneous monuments will be determined at a subsequent date, the place and event to be marked influencing the kind of memorial.

The Battle Monuments Commission will attempt to centralize the significant events of the conflict in three pretentious commemorative monuments. These will be located in the areas of St. Mihiel, Meuse-Argonne and Meuse-Aisne. These memorials will indicate on small-scale bronze relief maps the daily battle-front lines of the American contingent and the location of other monuments of the project contiguous to these centrally situated markers. The design of this monument will bear similarity to that of the Battle Monument at West Point. The locations of these monuments, however, are perplexing the minds of the commission and the plan may be finally abandoned. Substituting for this once contemplated arrangement will be the reservation of a room in the main building at each cemetery for the display of relief maps and additional data relating to the monuments and operations in the vicinity. The three American cemeteries suggested for this purpose are those located at Romagne, Belleau Wood and Thiaucourt.

Battlefield monument erected by the 37th Division in the Meuse-Argonne area.

Monument erected by 27th Division to those who fell in operations late in September, 1918.

A bill providing that the seller of liquor that kills a person who drinks it shall be adjudged guilty of murder is directed at the unscrupulous alien who has gone into peddling of poison for profit. Such a bill will be introduced at the coming session of the New York legislature.

Eight times the volume of water that flows over Niagara Falls was recently turned loose in the Panama Canal, to test the 14 spillway gates.

Several thousand birds alighted on the decks of the Cunard liner, *Scythia*, when the vessel was about 400 miles out of New York on her voyage to Liverpool. Among them were wild canaries, redbreasts, thrushes, sand pipers and Juncos. It is presumed that they had been blown to sea during migration from North to South and Central America. A number were still flying about the vessel's deck on her arrival at Liverpool.

When a locomotive rounds a curve the rail suffers from the pressure of 60,000 pounds a square inch.

The United States Supreme Court has decided that Japanese cannot be naturalized in the United States and cannot become citizens of this country. This new ruling will affect not only Japanese in this country, but also all Japanese who by reason of Army or Navy service with American forces during the late war were granted citizenship.

An entire point of land 30 feet high and four acres in area disappeared into the upper Big Eauclaire Lake on a chain of four lakes located 18 miles east of Gordon, Wisconsin. Geologists surveying the spot found that the entire point from the sloping shore line to the 30-foot embankment had dropped into the lake leaving a precipice 30 feet high. Trees 30 feet high are barely visible above the water of the lake.

"The business woman of today should do away with strongly scented perfume, take off her silly clothes and dress in a sensible fashion that will keep her mind on business," declared the president of a prominent business college in Ohio. "The woman who goes out of a business college and into offices looking for a job has a small chance of getting away with a recommendation if she is one of the hand-painted, baby-doll type," he continued.

A Saint Andrews Roller canary trained to sing and stop on command has been presented to Mrs. Harding.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

For the first time in 105 years the Planters hotel of St. Louis, Missouri, recently stopped receiving guests. The "Old Planters House" will be converted into an office building after New Year's Day. This old hostelry in the '40's and '50's was considered the social center of the Southland.

Timothy Healy, the governor-general of the Irish Free State, is the first untitled person to be chosen as the King's representative in any British dominion. The governor-general's aids will be officers of the Irish army instead of officers holding commissions from the King, according to recent dispatches.

"Extra girls" from Middle West farms, factory towns in New England and the plantations of the Mississippi Valley are thronging the streets of Hollywood, waiting for an opportunity to break into the films. Many are facing heartbreaking social and financial situations with but little hope for the future.

A West Indian hurricane was recently followed for two weeks over a distance of more than 5,000 miles by means of reports made to the Weather Bureau. The storm originated somewhere between West Africa and the Windward Islands, and traveled to a point about midway between Porto Rico and Bermuda. It then swung north and east, finally breaking up on the west coast of Europe.

"Drive safely. A fatal accident occurred here." A number of signs bearing that inscription have been posted on a Massachusetts highway near Boston, at points where persons have been killed by automobiles.

The Pennsylvania Railroad serves approximately 10,000 meals daily in its dining cars.

Abundant fruit crops in Holland failed to benefit the growers, as Germany is not able to buy and Britain is well supplied. Consequently the fruit is selling for extremely low prices.

Anthracite in sealed box cars is being shipped to western cities. This is necessary to assure full shipments reaching destinations as otherwise the cars may arrive with about one-half the original shipment, after going through communities where coal is scarce.

A pair of trousers, said to have been the property of the American hero sailor, Captain John Paul Jones, sold at auction in London recently for $90.

An airplane photograph showing 336 square miles on films 100 feet long was recently taken by the Bureau of Mines. It required 450 mosaics and 16 hours of flying to do the job. Some of the richest oil-bearing reserves on the public lands are included in the area pictured. These included the Salt Creek and Teapot oil fields in Washington.

British antiquaries are rejoicing over the finding of an ancient Egyptian palace in the "Valley of the Kings" on the site of ancient Thebes, near Luxor. The gem-studded throne of Tutenkhamun, one of the heretic kings of the Eighteenth Dynasty, was found directly below the tomb of Rameses VI. This throne is described as one of the most beautiful art objects ever found. Furniture, robes and statues were also found as well as important papyri which are expected to clear up many important points relating to conditions as they existed there about 1350 B. C.

The followers of Emiliano Zapata, the dead rebel leader of Mexico, are to be given a tract of land in the state of Morelos by the Federal Government. One of Zapata's aids will head the colony, in which 150 former Zapatistas and their families will live.

Honduras has dropped out of the League of Nations because of the high cost involved.

Japan is to have a symphony orchestra, headed by a Russian director.

Mt. Everest climbers find that an exhausted man does not recover his strength quickly in descending the Himalayan mountains as is the case in the Alps which are much lower.

Eggs sold in Denmark are numbered so that each can be traced to the farm from which it originated.

Christmas Season 1922

Here Is the Solution of What to Give This Xmas

The selection of gifts which express adequately the donor's sentiments and are yet inexpensive, presents a real problem. Last year, thousands of our readers availed themselves of the suggestion that they send THE DEARBORN INDEPENDENT as a Christmas Gift. The cost for a year's subscription is so small compared to the many hours of pleasurable and instructive reading which THE DEARBORN INDEPENDENT offers that it solves the problem immediately.
An attractve gift card bearing the donor's name will be sent to each friend announcing the coming of the magazine during the year 1923. Simply fill in the names and addresses in the space provided and forward with remittance.

12-23-22

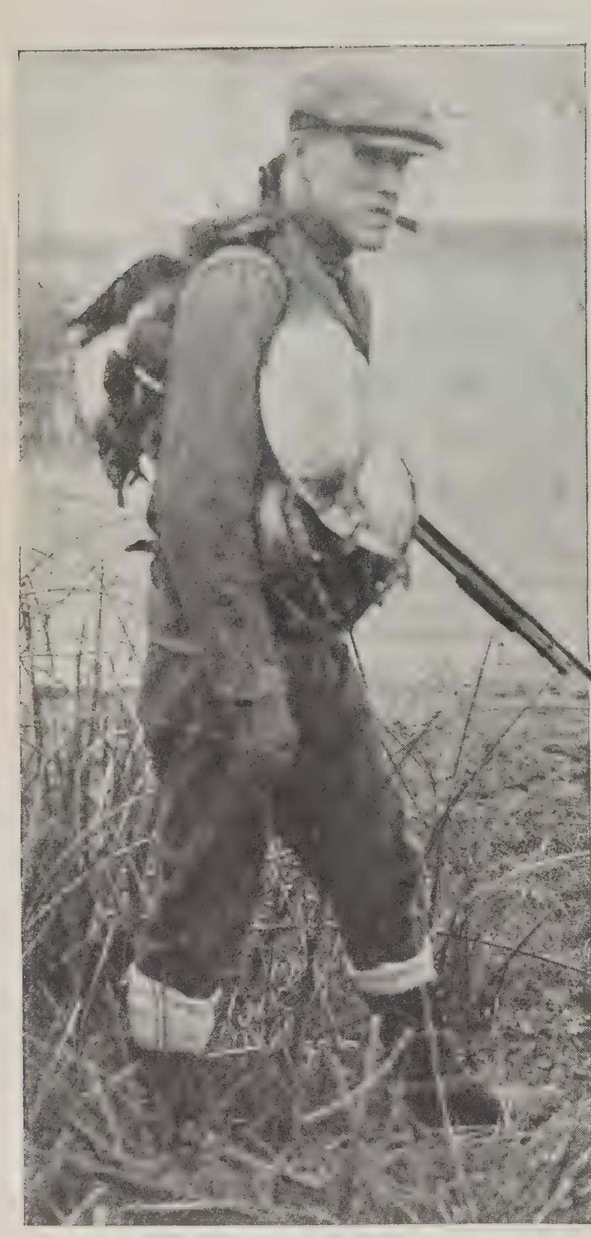
Shipstead, in Whom Farmers of Minnesota Believe

Tragedy of State Reflected in Senator's Election

By J. M. MILLER



DR. HENRIK SHIPSTEAD,

As a duck hunter. After the recent election he sought rest in his favorite sport. He uses a 20-gauge gun.

ALTHOUGH several weeks have passed since the election last November the professional politicians are still trying to explain how, why, and what it was that happened to them. In Washington and throughout the country the bosses, the politicians and their touts are still trying to explain.

The other day the writer met the venerable Senator Nelson, of Minnesota, and Senator Cummins, of Iowa, together. This was said to Senator Nelson: "Minnesota has become extremely radical, hasn't it, Senator?" He didn't have time to answer for Senator Cummins shouted this: "At that, not so much so as Iowa." Senator Nelson laughed heartily.

"But Senator-elect Smith Wildman Brookhart, of Iowa, was elected on the Republican ticket and Henrik Shipstead, of Minnesota, on a third party ticket," Cummins was reminded.

"That doesn't make any difference as regards the rank radicalism rampant in Iowa," said that state's senior Senator, disgustedly.

This is given as a sample conversation that is constantly going on in administration circles in Washington, sometimes behind closed doors but often openly. These questions are asked in the desperation of the politicians:

Have party lines been forever broken down?

Won't the people any longer pay any attention to the campaigning of the Administration's Cabinet officers and its other heavy oratorical guns?

And why, in many instances, did the people vote against the advice of our leading newspapers?

The following men elected to the United States Senate are called radicals, and even harsher names, by the professional politicians: Wheeler, of Montana; Howell, of Nebraska; Smith W. Brookhart, of Iowa; Frazier, of North Dakota; Shipstead, of Minnesota—not to speak of La Follette, of Wisconsin, who was reelected by overwhelming pluralities. No one has, as yet, appeared to place Senator-elect Ferris, of Michigan, in the "radical" class. But his election by a substantial plurality stunned the administration politicians as severely as the political revolution in any other state. Senator-elect Edwards, of New Jersey, is not designated as a radical except on one question, which was his only issue, namely: "I would make New Jersey and the nation as 'wet' as the Atlantic Ocean." Senator-elect Copeland, of New York, who snowed under Senator Calder, the administration candidate, with a great avalanche of votes, was unknown as a politician.

The election has demonstrated, perhaps more than any other we have ever had, that the people are determined to throw the professional politicians into the discard.

From what the writer had previously heard and read about Henrik Shipstead, Senator-elect of Minnesota, he had almost come to visualize him as a wild-eyed, long-haired "Red." The other day a strong and able-bodied friend in Washington asked me if I would like to be introduced to the Senator-elect. "Is he civilized?" he was asked. "I'll protect you," he said laughingly.

Shipstead is a tall, rather stately and trim-appearing individual. He has the appearance of one coming from the ordinary run of mankind that gives a true American character to the Middle West. His father and mother were born in Norway and he is one of a family of 12 children. He was born in Minnesota 41 years ago. He talks with a rich and quaint Scandinavian accent. When he talks rapidly he does not pronounce his "th's." For instance, in haste he may say "tink" for think. He beat Senator Kellogg by 87,000 plurality. Mrs. Oleson, it will be remembered, was the Democratic candidate for United States Senator. Her candidacy, it is claimed, had the effect of bringing out the female vote on all three tickets; Republican, Democratic, Farmer-Labor. Dr. Shipstead (he is a practicing dentist in Minneapolis) is the only United States Senator elected on a ticket independent of either of the two old parties. "How much did your campaign cost, Senator?" I asked him.

To my surprise the answer came: "It cost millions of dollars and was bought and paid for during the two years before election day by the farmers and toilers of Minnesota. Besides millions in dollars, my election cost much bloodshed," he said.

"Did your election cost more than that of Senator Newberry, of Michigan?" he was asked.

"Far more," he answered, "but I will explain that.

"The farmers of Minnesota left thousands of acres of potatoes in the fields to rot—thousands upon thousands of acres, and the country needing cheap food. They could not afford to dig them for there was no market for them!—think of that, no market for them! The freight rates, and the men who control the markets are such grafters that the potatoes would not pay for the transportation alone. Every piece of business machinery that the farmer came in contact with seemed to have one design—to prevent food reaching the people.

"There were several hundred suicides among the farmers of the Northwest. Eight took place in one township. The farmers are now unable to pay their taxes and their farms are being sold for the taxes and the mortgages foreclosed. *There is a horde of men from the East who have heaps of ready cash and are in Minnesota buying tax receipts, or certificates, when the homes and land of the farmers are sold by the authorities for taxes. On these tax certificates these speculators get a very high rate of interest and eventually will get the homes and land of our people. They ruined our people first, and now they come in and take away their land and homes. You people in the East cannot realize what goes on within our own borders—our own United States.*

"Thus my election has cost the good people of Minnesota millions of dollars—and bloodshed. As regards the campaign, I paid out just a little more than $1,500."

"What did the people of Minnesota think of Senator Capper, of Kansas, coming up there for the administration and speaking for Senator Kellogg," he was asked.

"I would rather not comment on that matter at this time," Senator-elect Shipstead said.

A friend, however, was not so reticent. "I will tell you what they thought," said he. "The people of Minnesota were amazed. You could hear them saying everywhere: 'Why, we thought Senator Capper was on the level. He has pretty nearly the same situation in Kansas as we have in Minnesota and here he is speaking for this administration and Senator Kellogg, all of them, owned body and soul by the big corporations. Capper has turned out like the most of them; he is on the political treadmill, with the professional politicians and the corporations."

In reply to a request for a statement of his political opinions and career, Senator-elect Shipstead said:

"Two years ago I withdrew from the Republican party, as Roosevelt did in 1912, and ran as an Independent candidate for governor. The progressive men and women of Minnesota, irrespective of party affiliations, approved of my action to such an extent that they gave me a total of 281,000 votes.

"At that time I made the following statement: 'We are facing a crisis in our political and business life. We believe that the immediate enactment of legislation to alleviate the coming disaster is of such urgent need that we must use all honorable means to insure its passage now rather than wait two years.'

"Later, in speeches, I pointed out the disaster that would come to business and agriculture because of the arbitrary action of the Federal Reserve Board and the passage by Congress of the Esch-Cummins railroad bill. Time has since vindicated my judgment.

"Last year a pre-primary convention law was passed by the legislature of Minnesota. It was enacted for the purpose of keeping the old reactionaries in power by handicapping progressive candidates who might file in the primaries. Therefore, this group of 281,000 voters, who so nobly withstood the poison gas propaganda in the last campaign, nominated me as their candidate for the United States Senate on the Farmer-Labor ticket.

(*Concluded on page 13*)

Senator-elect and Mrs. Shipstead.

Mrs. Shipstead and 13-year-old Weston Shipstead, the only child.

The Mysterious Killing of Major Cronkhite and Amazing Actions of Captain Rosenbluth

Attempt to Undermine Faith in American Administration of Justice Held Without Parallel in Our History

By CHARLES ALBERT COLLMAN

THE singular circumstances attending what is known as the Rosenbluth-Cronkhite case, comprise the latest of a series of events which, because of their bearing on racial collisions or social cleavage, mark epochs in a country's life.

For nearly two years a campaign of publicity, so voluminous and widespread that it can scarcely have had its parallel in our history, has testified to the attempts that are being made to undermine faith in the administration of American justice. Appeals to the elements of discontent, virulent attacks upon law officers of the government, have marked this propaganda; and what is still more unfortunate, thousands of aliens, ignorant of our country's language and its ways, are being taught in their vernacular press that the United States is persecuting deliberately a member of their race.

When such an expenditure of money and effort has been made to cast a smoke-screen of obscurity about the facts in this case, and to create an "atmosphere of persecution," it would seem time that an accurate account be given of these remarkable circumstances, together with all such relevant and authoritative information as is at present obtainable and permissible to use. This seems the more necessary, because what previously was merely a campaign of mischief, now approximates a dangerous form of propaganda, more especially since the heads of a powerful and countrywide organization, the American Jewish Committee, or, New York Kehillah, have intervened in the legal proceedings. This organization will undoubtedly prove its supreme test of power if it accomplishes its efforts to nullify the acts of public officers and destroy the functioning of one of the greatest departments of the United States Government.

ON OCTOBER 26, 1918, a dispatch was sent by the Associated Press from Camp Lewis, Tacoma, Washington, that Major Alexander P. Cronkhite, of the 213th Engineers—son of Major-General Adelbert Cronkhite, in command of the 18th Division, then at the front in France—had accidentally shot himself on a pistol range in the camp with an automatic pistol, dying within two minutes.

At the time of his death, the young major—he was but 24 years old—was in the company of two men who were the only witnesses. The scene of this tragic occurrence was a lonely trail through the woods, where the major had gone to reconnoiter, and where he was hidden from the sight of his men by a fence and a screen of thick underbrush some 50 yards in advance of his column. The two witnesses were Captain Robert Rosenbluth and Sergeant Bugler Rolland Pothier, on whose testimony, subsequently, a military board at the camp reported a finding of "death in the line of duty," from the accidental discharge of a revolver.

West Point Graduate and the Son of a General

THE young man who met his death under the mysterious circumstances, subsequently to be detailed, was descended from a long line of military ancestors. He was graduated from the United States Military Academy at West Point, in 1915, near the top of his class, and was assigned to the Corps of Engineers. While he was still captain, he knew the personal history and troubles of every man in his company. "His three years of service," to quote from the *Army and Navy Journal* at the time of his death, "earned him the reputation of being one of the most efficient and brilliant officers of the Corps of Engineers." One of his lieutenants wrote of him: "Major Cronkhite represented to the junior officers and men in the ranks, the ideal commander. He formed our regiment. He took our enlisted men fresh from the draft, the officers directly from the training camp, and built the organization. He knew every noncommissioned officer and was the living, driving force of our regiment." To quote from letters of his colonel: "I had only recently rated his qualification card, and had given him the highest rating I have ever given any officer, and I doubt whether there are many officers in the service whose rating is as high. His loss to the regiment has been very great, and his death a great grief to me personally. He was so clean in his life and thought, so thoughtful of others, so considerate of his men and so efficient in the performance of his duties, that I considered him one of the most capable officers I have ever known."

Major Cronkhite was the grandson of Colonel Henry McLean Cronkhite, United States Army, and Major-General Alexander C. M. Pennington, United States Army, class of 1860, United States Military Academy, who actively participated in the operations of the Army of the Potomac throughout the Civil War. His great-grandfather was Professor John W. French, who was chaplain of the United States Military Academy and professor of ethics for many years. The young man was descended from one of the oldest and most prominent families in New Jersey, two members of which, William S. and William Pennington, were governors of that state, the latter having been speaker of the United States House of Representatives; and his great grandfather, Alexander C. M. Pennington, also served as a member of that body. During the year 1918, there were three generations of his immediate family on the active list in the regular service.

Did Captain Rosenbluth Resent Cronkhite's Criticism?

MAJOR CRONKHITE trained many hundreds of engineer officers for service in the war, as senior instructor at various training camps. Assigned to duty with troops, he organized, as has been mentioned, the 213th Engineers at Camp Forrest, Chickamauga Park, Georgia. This was early in the summer of 1918, and it was here, toward the middle of August, that he first met Captain Robert Rosenbluth. The latter, then a man about 40 years old, had attended the officers' training camp at Plattsburg, New York. Both Captain Rosenbluth and Sergeant Pothier were at Camp Forrest throughout the summer of 1918.

In the beginning of October, Major Cronkhite's regiment was ordered to Camp Lewis, Washington, to join the 13th Division, which, after an additional period of training, was scheduled for over-sea duty within a few weeks. On arrival at Camp Lewis, the major was taken ill with the influenza on the morning of October 9, and remained in hospital until noon of October 21. Four days later, on Friday, the morning of the 25th, he went out on a tactical march with his regiment.

The column was in command of Captain Rosenbluth, as senior line officer present. Major Cronkhite was senior instructor and umpire. His was the duty of giving the tactical problems for solution, and to criticize the manner in which they were executed. He had established the reputation of having that peculiar faculty of making criticisms and suggestions without incurring any man's unfriendly feeling. But his fellow officers state that in this respect there was one exception. According to their testimony, the major had felt called upon to direct some criticism to the work of Captain Rosenbluth, on previous occasions, and that the latter, for three days or so before this ill-fated march, had seemed to be nursing resentment about it.

From the time the regiment left the post that Friday morning, Major Cronkhite, in giving out his problems, had trouble with Captain Rosenbluth. The latter appeared confused, and, according to the stories of the men, he got the troops all mixed up.

"What are you trying to do—kill all your men?" asked the major. And he pointed out to the captain that if they had been in a real battle in France at that moment, the regiment would have been wiped out.

Some of the men have stated that they overheard the captain exclaim: "It's none of his d—— business. I'm running this outfit." However, to judge from numerous post-bellum stories, occasions for friction of this sort were quite frequent at times when thoroughly trained young West Pointers were called upon to supervise the work of much older men who had had advantage only of the more hurried instruction in officers' training camps.

Troops Lose All Sight of Three Officers Ahead

THE column had now reached the site of an abandoned schoolhouse. It should be stated here that the county government of Pierce County, Washington, considering that the residence of a body of troops would be of pecuniary benefit to the community, had obtained by condemnation proceedings, at the expense of the county, a tract of land of approximately 70,000 acres in the vicinity of American Lake, and had donated it to the United States, as a mobilization, training and supply station, to be garrisoned by Federal troops. This matter had been approved in January, 1917, and by the terms of the act, the lands were vested in the United States on the recording of the deed in Pierce County, by the chairman of the board of county commissioners. This tract had thereupon been named Camp Lewis. It consisted of forest and woodland, cleared and cultivated fields, orchards, farms and a variety of buildings, all of which had by this time been abandoned.

From this point on, the route of the column followed the trail from the schoolhouse. As shall be shown later, the characteristics of this particular section of the government reservation had an important bearing on the subsequent developments of the Rosenbluth-Cronkhite case. Captain Rosenbluth, calling attention to the fact that the hour for luncheon had arrived, suggested that the column continue up an unused road, which led to an abandoned group of farm buildings, once known as the Schuffert farm.

An argument ensued in front of the schoolhouse. The captain was familiar with the topography of this part of the reservation. The major, not knowing the nature of the country traversed by the unused road, had expected that another route would have been chosen, leading along a good, open road in the direction of Nisqually Lake. The captain meanwhile had led the column to the top of a hill, and the major, overtaking Rosenbluth and Pothier, continued up the trail, and was soon lost to sight behind the heavy fringe of trees and bushes that inclosed the long disused cart track. He was evidently bent on reconnoitering the ground before the regimental column reached there.

Captain Rosenbluth, who had at first started to accompany his superior officer, now fell back and instructed Pothier to halt the column. The sergeant bugler, having obeyed these instructions, continued after the captain and the major, and immediately all three were lost to the sight of the regiment.

The order to halt had come so suddenly and unexpectedly that the officers looked at one another in surprise, wondering what was the matter up in front. Scarcely had the halt been made effective, when three sharp pistol shots rang out. A tense and apprehensive silence fell upon the column. Lieutenant Elmer W. Seaburg, of the Medical Detachment, and several of the line officers, left their positions and went over to the fence that lined the cart track. They strained their eyes ahead, but the thick shrubbery prevented their catching a glimpse of the major and his companions.

Major Dies of Wound From a .45 Caliber Revolver

TEN slow minutes passed, and then suddenly Captain Rosenbluth came tearing down the cart track, calling for Dr. Seaburg. The doctor, calling to two of the medical men to accompany him, double-timed up to the scene of the shooting. Captain Rosenbluth had returned, and was holding up the head of Major Cronkhite, whose body lay stretched on the ground. The major was pulseless. Strychnine was administered, and artificial respiration attempted, but quite uselessly, for the young officer was dead.

The reader must bear in mind that the immediate scene of the occurrence was in front of two gateposts leading to the abandoned Schuffert farm. The farm was inclosed and subdivided with picket fences. To the left stood the farmhouse, and beyond it sheds and a well. Beyond again stood a hen house and an inclosed chicken run. To the left were stockyards, with a large shed and a big barn. To the rear of these numerous buildings was an orchard, surrounded by cultivated fields. The entire farm lands were surrounded by heavy pine woods.

Major Cronkhite had been killed by a shot in the right breast, from a .45 caliber, jacketed, revolver bullet.

There are persons who, under the influence of a high nervous tension, talk incessantly and voluminously. They talk, and talk, and talk. They ask: "What is your theory about this? How do you suppose it happened?" The talkers suggested that Major Cronkhite had had an attack of heart failure. That he had been weakened by the "flu," the pistol had turned in his hand, and he had shot himself. They reasoned that he had a "double-jointed wrist," which made it possible for him to shoot himself in an impossible place. Later they tried to cast discredit upon the dead man, by circulating a report that the young officer had committed suicide.

Rosenbluth's Story of the Death of His Superior

AT SUCH times, men of normal minds say nothing, but listen, and perhaps suspect. Such was the attitude of the men of the 213th Engineers.

No sooner had the young man's body been taken to the base hospital, than the men of the regiment knew that their major had not shot himself.

The account given by Captain Robert Rosenbluth, after the shooting occurred, was that there had been no one near the major at the time excepting himself and Sergeant Bugler Pothier, who had been acting as the major's messenger. He did not think the men of the regiment could have seen the shooting, as they were at least 50 yards away.

According to the captain, several times during the march, and while giving problems, the major had taken out his revolver and pointed it without shooting. Apparently he had no bullets in his gun at the time, be-

Why Don't They Tell?

STRAIGHTFORWARD dealing would go far to clear up the American mind on the subject of help for Europe. There is a gulf of distrust between the People and the persons who are supposed to represent them, and mere statement will no longer do. For one banker, and then another banker, and then a third banker, and then a whole group of bankers, followed by flocks of distinguished speakers and writers who are employed by associations which are supported by bankers—for this crowd of forceful brains to hammer on one string, "America is not helping Europe," is insufficient. It doesn't mean anything to our people, and they are suspicious that it may conceal a great deal.

It has apparently never occurred to the publicists that the People want to know more about this matter, and they have a right to know more. Or—maybe it has occurred to honest publicists, and maybe the real powers behind this propaganda have vetoed it.

The People of the United States have been allowed only the vaguest idea of what it is all about. It would seem the most primary suggestion of successful pleading simply to tell them what it is about.

If someone who knows will plainly tell the American people

(1) Why Europe needs help.
(2) What kind of help she most needs.
(3) What kind of help the United States can best send.
(4) Through whom this help would go.
(5) In what form and by what means it would finally come to the People of Europe

—then the American people would be in a position to consider the matter.

As it is, the American people do not know. They do not know whether Europe most needs money, or seed, or factories, or food, or efficient American supervision for the reorganization of its industries. The American people have a shrewd suspicion, however, that the principal need of Europe is to get the International Financier off her neck. And if it is proposed that the People of the United States pay blood money to the International Financier, there is doubtless another guess coming.

Will someone who is known as an honest man, and who can certify that he has all the facts, please rise somewhere in the United States and tell us, in full detail, just what would happen if the United States should make a colossal money gift or loan to Europe?

Tell the People exactly what the process would be.

Tell them where the United States Government would get the money, and how much interest it would pay.

Tell them who (giving full names and connections) would transmit the money to Europe, and how much would be paid them for doing so.

Tell them who would receive the money in Europe and how much they would charge for doing so.

Tell them exactly where the money would eventually arrive, who would control it, what it would be used for, and on whom the direct touches of its benefit would fall.

If these matters were not surrounded by such an air of false dignity—stage setting to deceive the plain and honest people of the country—THE DEARBORN INDEPENDENT would *dare* someone in authority to tell these things.

Is there anyone who will take the dare? Is there anyone who can point to a single effort made to inform the people of the details of a deal which in any other proposal would be the first things outlined?

"But Europe is going to collapse!" the concealing propagandists cry. Probably. The system now ruling in Europe ought to collapse. At the present time, American money will only perpetuate the most hideous Thing in the world, that baleful power that is hanging on the neck of Europe, sucking her blood, and calling to the United States to effect a transfusion of American blood that the veins may not run dry. The American people instinctively do not intend to nourish that Thing any longer.

It is up to the propagandists to show what our help would be, where it would go, what would be its first and principal uses.

Will they tell the People?

Will anyone who knows tell the people?

Children and Divorce

THE wail of those who cry because certain classes are not furnishing any children to society may be soothed by reflection on society's good fortune not to be blessed by reproductions of those classes. It is a wonder that societies have not been organized to send formal letters of thanks to those who have preferred to let their kind of humanity die out of the world with them. It would be a happy solution if all the useless human strains could be eliminated as easily.

There is, however, a problem complicated by children, and that is, the divorce problem. All that can ever be said about divorce itself has been said, and saying will not change it. It is a disease that will run its course until all those susceptible to it have either resisted or succumbed to it, and then like other diseases, its soil being exhausted, it will be less common.

Children are a sufficient reason for self-imposed restraint upon those intending a resort to the divorce court, but the sad fact is that this restraint is seldom exercised. Indeed, an ugly development has come in the status of the "divorce child." It was quite bad enough when the growing boy, home from college for the Christmas holidays, went round to one house to see his mother who was married to another man, and then round to another house to see his father who was married to another woman. That was so bad that the mixture of selfishness with the tragedy made it a shuddering circumstance to all properly sensitive minds.

But that is not the worst. Children are now appearing in divorce courts as pawns. If the woman can get the child or children, she can use them to hold up the man for money. If the man can get the child, then he may go free of money obligation to the woman. The possession of the child, its money value to the case, has been so disgustingly apparent in a number of instances that recently a Detroit judge broke forth into righteously indignant speech about it, charging the wrangling parents that neither of them loved the child or they would never have dragged its innocent fortunes as far as the divorce court.

The divorce lawyer, a peculiarly questionable type, has learned the strategy of the "divorce child." It is time for divorce judges, who have seemed to be a little slow in the matter, to learn the strategy of the divorce lawyer.

Taxes Eat Up the Timber

"AMERICA'S forests are inexhaustible," said our forefathers, and their attitude has been handed down from generation to generation. Like prodigals we laid waste our heritage until great areas became denuded. Floods, hitherto unknown, spread over territory that before had been shielded by friendly trees that absorbed and gave out moisture as needed. Other great spaces became arid and barren by the same token.

No alarm was sounded in behalf of our forests until recent times. Fortunately, an "about face" is taking place. Our government manifested interest in the matter. The public was informed that wide tracts of our remaining forests had been set aside as forest reserves and that reforestation had been encouraged.

It is, therefore, a distinct shock to learn that large areas are being denuded and others are withheld from reforestation because of the prohibitive tax on standing timber. It has been estimated that accumulated taxes on a growing forest as it matures would amount to more than the timber would be worth, or else make manufactured lumber a luxury. A large number of owners of cut-over land, unsuited for agricultural purposes, have declared their willingness to put into effect a reforestation policy, but are held back because *"Taxes eat up the timber."* One owner of large tracts of land stated: "When they don't tax us to death we will gladly reforest. Taxation is all that stands in the way of reforestation."

A proposed system of taxation on the land value basis is strongly advocated by many economists and favored by the National Forestry Association. Under this system, all standing timber is regarded as an "improvement," and is not taxed; growing forests are also exempt. Consideration of this problem would seem to have become necessary.

Cities Against the Country

IT IS significant that the proposal for a League of Cities should come from the least American city in the United States, the City of New York. *The proposal is that the Cities be leagued against the Country.* Students of the alien trend in our national life should keep an eye on this movement.

The proposal to league the Cities against the Country is much older than either of the gentlemen who have just been named. In those amazing documents called the *"Protocols,"* which in spite of their being called "forgeries" have a most disconcerting way of getting themselves fulfilled by agents of the very forces which deny them, it was long ago decided that *City and Country should be arrayed against each other.* For more than two years certain Jewish gentlemen have been very active in organizing the farmers of the United States. Most of the agricultural organization carried on in this country during the past two years, most of the new agricultural movements started, even to the new control of the agricultural press, has been the able work of able Jews. The Country is being already steered into line. Now comes—from New York!—the proposal to league the Cities. The Cities are being told that the Country Districts rule the Nation, foisting Prohibition on it and what not. And the Country Districts are being told that the Cities exist to oppress the farmers. There are various ways to divide country.

It is very remarkable. As was just now said, the "Protocols" are called "forgeries," but why do their prophecies keep coming true? And why always by easily identifiable agents? For example, in Protocol the Twelfth:

> "Our calculations reach out into the country districts. There we must arouse those interests and ambitions *which we can always turn against the city,* **representing them to the cities as dreams and ambitions for independence on the part of the country.** It is clear that the source of these will be precisely the same and that it will come from us."

How marvelously clear do these "forgeries" state events that are just now coming to pass. And if they tell truth as to the event, may they not also tell truth as to the meaning of the event?

Depending on Our Rulers

HISTORY has furnished, and is furnishing illustrations of the folly of seeking greatness in men that they may be elevated to positions of power. To demonstrate ability is often to incur the enmity of those who have seized the machinery of preferment. Mediocrity is more readily trusted and more easily placed in the seat of power. Of our Presidents, for example, how many have been chosen for party expediency?

Washington was the natural and unanimous choice for the executive office. He might have been a king, with full hereditary succession. Adams, patriot and aristocrat, perhaps the strongest exponent of federalism of his day, without doubt one of the best qualified for the position, was denied a second term. Jefferson narrowly escaped defeat by Aaron Burr, then a man most wonderfully equipped, save for moral character, of all the great men of his day. Jackson objected to the presentation of his name as a candidate, pleading that he was a soldier and not equipped for statesmanship; yet his Presidential record is one of the brightest and most American in the pages of our history.

Repeatedly, however, have the jealousies of party leaders defeated the ambitions of the recognized statesman, and given place to men of unknown merit. Webster, Clay, Cass, Douglas, Seward, Chandler, Blaine, Seymour—these are a few examples of the wrecks of political fortune among the better class of men in public life.

Lincoln himself, today standing with Washington in the honor and respect of all, was the compromise candidate of his party, and elected only because of the desertion from the regular ticket of the southern wing of the Democratic party. Grant was the choice of opportunism—or something worse. Hayes, perhaps the most conscientious man his party ever seated, and for that reason most distasteful to the machine—had never a following. Cleveland ran on his record. Benjamin Harrison on that of his grandfather. Wilson against his party's will the first time, and as a God-given man for the times on his second. Harding because the popular choice was a man whom the managers of his party hated and feared.

Rarely has the undoubted popular desire appeased. The "hidden hand" has really dictated the nation's choice of executives as well as the course of legislation.

And yet the Republic has sailed its course in safety, because of the quiescent nature of the people.

Still it is safe to say the instinct for being ruled, so dominant, is dangerous to national life. Its sequence is the creation of government by class, and *that* is as near monarchy as any monarchy that prevails today.

Mr. Ford's Page

ALL that we are here for is to get experience, and the product of experience is character. We think we are doing a number of new things and leaving the old behind; but what we are really doing is this—we are constantly returning to the old things, bringing our increased experience with us, and discovering after all that the "old" things are the newest in the world. There is really nothing new, but the old is seen at new angles; the old objects are reached by new methods; the old facts are approached by new generations. The staple of our everyday life—the staple basis even of the artificial life of the time-killing class in New York—is old, old as the race.

There is nothing new except new appreciation, new understanding; and these are the result of experience, and the result of experience can only be character.

That statement by itself, however, may have no practical bearing, but it is capable of endless application, and its clear understanding would liberate us into a great deal of useful knowledge. The routine of life is crushing unless we have an interpretation. In the Good Book there is a pessimist who saw the ceaseless round of life and wondered what it meant. "One generation passeth away and another generation cometh, but the earth remaineth the same. The sun riseth, and the sun goeth down, and hasteth to the place where he arose. The wind goeth toward the south, and turneth about to the north; it whirleth about continually, and returns to its circuit again. All the rivers run into the sea, yet the sea is not full; unto the place whence the rivers come, thither they return again." What is the use of it all?

WE ARE here for experience, and experience is a preparation to know the Truth when we meet it. We shall know that we have reached Truth when we are free. Everything that helps make man a little freer is headed along the highway of Truth. This does not mean books and ideas only, it means mechanics and commerce and science. Even the motor car is an element in the liberation of mankind and will rank higher than many a philosophy in its effect on human destiny: it is freeing more men, freeing them into more different regions, than most book systems do. We are mixing our experiences more than ever before, which ought to result in our making swifter progress toward the twin Objects of Experience—Truth and Character.

Experience, that is the answer. One class goes out of the school of life, another class comes in; the school remains. What is the answer? Experience. That is what the school is for. Take the rivers mentioned by the pessimist. They ran into the sea, they returned in clouds of rain, they cleansed and watered the earth. It was a ceaseless round, but it was accomplishing something. The rivers needed to be run into the sea for their own cleansing; then they came back to keep the earth fruitful. Why? That the human business of Experience might keep moving on.

The basic things, then, are very old. Nothing that was ever useful passes away. If a light-headed group comes along and imagines that they have found a new morality, and if they draw to their books and plays and strange philosophies a following of other light-headed groups, serious people are inclined to believe that the old morality has passed away—the good old type of goodness, they say, is gone! It is a rather foolish position to take and causes needless worry. When the false prophets of commercial book-making have been forgotten, there will be enduring quality found in a straight saying like that which Irving Bacheller lately made: *"Either you have the old morality or you have none."* There is not anything new in the basis of human life. The seeming newness is confined within the reactions of our own experience in learning the reality of the old.

Now, there is a basis, something that remains unchanged, and it is the chief object of life that we should find it. Because people do not find it in one lifetime, it has been thought that a lifetime is not the full term at school, but only a day's session. However that may be, it is perfectly clear that the highest result of life is that men should find the basic truth about things.

How do we know when we have found it? How do we know when we have not found it? What should be our attitude toward the things we are doing while we are trying to find it?

We shall know that we have reached Truth when we are free. We shall know that we are on the right road toward Truth when the things that we are doing make men a little freer than they were. We shall know whether we are on the right road or not by examining what our motives are. Mistakes may be committed with right motives, but the general direction is right when the motive is right. These are things that we may be perfectly sure of. These principles belong to the very basis of things.

In some instances we are doing right things in the wrong way, and because the method is wrong and the wrongness begins presently to show in wrong results, people are quick to draw the conclusion that the whole thing is wrong. They want to wipe it all out. They want to overturn all the machinery of social or political life. Well, if that were the right thing to do, then it would be the right thing to do. May we never be fearful of the cost of the right thing, but may we also remember that the cost of the right thing is not high in those values that count.

It will be one of the great surprises of human experience, when the Truth comes everywhere, to see how near we were to it all the time and did not recognize it. It will be a great surprise to see how little (and yet how vital) were the changes to be made in our exterior mode of doing things. The fact is, we have headed along the main lines of service and truth now, but we have infected what we do by wrong motives. Take what the people probably regard as the most suspect of all lines of activity—finance. It is true that our present system is a hodgepodge. No one understands it because it is no more understandable than is Chaos. And it has many and many a loophole for the game of illegal and immoral profit. Of all things, Money in the mass ought to be the last that anyone should be able to play games with. With the money in his own pocket, if it be there by right, a man has a certain degree of liberty. But to take the nation's stock of money and subject it to such tricky manipulation that it is squeezed a little here, and leaks a little there, and sometimes disappears almost entirely—there is no one will say that a system which permits this is a perfect Monetary system. There is no public opposition to the footrules and the yardsticks and the peck measures of the nation. Only to the Dollars and those who manipulate them.

And yet, when a system based on Truth arrives, there will be footrules and yardsticks and peck measures; common life demands them. Why should there not also be Dollars as stable in their use as a footrule is or a yardstick? We never hear of any deflation of peck measures? The people have laws to punish the deflation of peck measures by unscrupulous merchants. Yet the Dollar is the open field for all the tricks that avarice and cunning can play; tricks that would be absolutely ruinous if the tricksters did not have the industry and continuity of human society to fall back upon.

Now, it is clear that in a system based on Truth, business would be done, and the service which financial institutions are supposed to render to business would be needed and would be given. The financial machine is kept in its present condition because it enables the operators to play tricks with it. Operators whose real business was the service of the business of the world would fix up the financial machine, so that it would work smoothly and efficiently, with benefit to all and with danger to none.

If there are to be banks and bankers in a social system based on Truth, it is evident that in the financial system we are already headed along a highway of necessary service, and all that we need is a different motive behind the operation of the institutions.

That seems simple enough to say, but do you know that it is easier to destroy the whole system than to get a different motive in it? Yes, much easier, because men are so dim in their minds. What seems the simplest thing to say is the hardest thing to do. The reason it seems so simple is that our eyes are glued on the exterior thing and our pride is fastened on our own blind way of doing things.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Bringing the World to Our Easy Chairs

Humanizing Dry Pages of Science Brings Success to American Society

By D. JAY CULVER

THE most remarkable society in the world has its headquarters in Washington, D. C. Once famous for its exclusiveness, it now has more than 750,000 members. The charter members were scientists connected with the technical branches of the government in Washington. Now any person may join who is interested in the broad field of geography and can be recommended by one already a member of the society. These members are scattered over the earth's surface from Ceylon to San Salvador.

In 1888, a small group of men, brought together by their common interest in science, met to discuss plans for a permanent organization. They wanted to meet regularly to exchange ideas and to discuss their various problems. Upon organizing, they decided to adopt as their name, "The National Geographic Society." The group met at frequent intervals for 10 years and listened to formal discussions and reports from their learned members. But these reports were so highly technical that only a trained scientific mind could appreciate them.

At a meeting of the executive committee one day, the late Dr. Alexander Graham Bell, a founder of the society, tossed a bomb into the midst of "this little group of serious thinkers." He suggested that the bars be let down so that the citizens of the nation might join them. This was too radical an idea for them to grasp immediately.

Had any one else proposed so revolutionary a step, he would have been promptly and severely frowned upon. That would have ended it. But they had too much respect for Dr. Bell's opinions to scoff. They appreciated his intense earnestness and listened.

"There is no more fascinating subject than the universe in which we live," he declared. "Everybody would like to go wandering about the world, to see its marvels, and to become acquainted with its strange peoples. Only a very few of us are able to do this. Let us bring the world to them!"

He showed that if the geographic knowledge gathered by the society were presented in an attractive manner and the technical padlock removed, the American people would be eager to get it.

After lengthy debate, the board of directors voted to adopt Dr. Bell's plan without reservations. They wisely chose him to discover ways and means of carrying out his own project. He began the search for a man combining editorial genius and a sixth sense of organization to reconstruct and humanize the society's magazine. The man he sought must be conversant with science; with that, he must be a skillful executive and a man of vision who could act.

Dr. Bell was in no hurry. A year passed and he had found no trace of the man he was seeking. One day an article in the *Century Magazine* on the latter-day sciences attracted his attention. The writer was unknown to him. A month later, another article on the same subject appeared and Dr. Bell was firmly convinced that here was the man he needed. From the editorial offices of the *Century,* he learned the writer's address and he wrote to him, requesting an interview. Meanwhile, he gathered what information he could from his friends regarding the author of the articles. He found that he was the son of a distinguished Amherst professor and that he and his twin brother had won all the available scholastic honors at Amherst in their senior year.

But Dr. Bell was scarcely prepared to have a young chap of 23 walk into his office and introduce himself as Gilbert Grosvenor. He had expected at least a middle-aged man. Recovering from his surprise, he outlined his plans for the reorganization of the National Geographic Society. He made it clear to young Grosvenor that he would be expected to devote his whole life to the task; that there were infinite possibilities for the development of the society although nothing had been done as yet to prove it. He further assured him that he would be given every moral support, but the society's financial cupboard was bare and they could offer him but a small salary. Mr. Grosvenor asked for time to consider the proposition. The next day he returned with his decision. He would tackle it and risk the ultimate compensation.

When Mr. Grosvenor assumed his duties as managing editor of the society's expansion activities, in 1899, he rented a small office and there started to formulate his plans for a national organization. The circulation of the magazine which was sent to each member, was at that time less than a thousand. Frequently he addressed the magazine wrappers himself because he could not afford to hire an office boy. Today a clerical force of 500 is needed to carry on the multifarious work of the society's offices where the records of 750,000 members are kept, 70 clerks doing nothing save effecting changes of addresses!

The early issues of *The National Geographic Magazine* were as dry as dust to the average reader. Tables of statistics were the only illustrations used. It was purely a scientific journal. Mr. Grosvenor's first editorial act was to rewrite the learned treatises so that they could be understood by the layman interested in other lands and peoples. Photographs were just beginning to be used sparingly as illustrations in other magazines. The editor of the *Geographic* appreciated their appeal to human interest and adopted their use in his publication. As the photographs began to appear, the readers became interested, and when they discovered that the articles did not go over their heads, they became still more absorbed in the romance of geography. As money from annual dues came into the treasury, the editor sought to improve his magazine both in its scope and mechanical excellence. He was especially particular about the reproduction of the photographs.

DR. GILBERT GROSVENOR,
President of the National Geographic Society.
At the top—The home of the National Geographic Society. The society's vast work is centered in these dignified buildings, 16th and M streets, Washington, D. C.

ROBERT EDWIN PEARY
DECEMBER 15 1909
A SPECIAL MEDAL
APRIL 6 1909

The Peary special medal.

Dr. Bell's original idea had been "to increase and diffuse" geographic knowledge and Mr. Grosvenor decided to go a step further and "humanize" it. The young editor did not, however, center his whole attention on the magazine. As a result, the National Geographic Society in its 35 years of existence, "has sailed the seas, climbed the mountains, pushed into frozen zones, explored volcanic craters, and studied the past of the earth in quest of facts to spread upon the page of human knowledge."

Were you aware that the National Geographic Society is to be thanked for preserving the Big Trees of the Sequoia National Park? In 1916, Congress appropriated $50,000 to buy certain private holdings in the park, but the owners asked $70,000 for their property. The National Geographic Society subscribed the necessary $20,000, and thus made possible the purchase of 667 acres, all of which became the property of the United States Government, to be held for the people for all time. In 1920, three members of the society gave more than $25,000 to buy an additional tract of 609 acres, which was also given to the people. And in 1921, 1,000 acres more were bought by members and friends of the society at a cost of $55,000, and deeded to the United States Government.

About six years ago, in Alaska, Professor Robert F. Griggs, of Ohio State University, in charge of one of the society's expeditions, discovered what has been called the eighth wonder of the world, the Valley of Ten Thousand Smokes. It is situated a few miles from Mt. Katmai, which is the largest active volcano on the globe. It was once a peaceful valley of trees and flowers, but has been transformed, by the opening of countless small vents, into a magnificent inferno. Picture all the steam engines in the world, assembled in one valley, blowing off steam at once! That is its effect! This valley is now a national park, by presidential proclamation.

Another expedition discovered the hidden ancient city of the Incas, Machu Picchu, perched high on a ridge of the Andes, where it was built centuries ago by that wonderful people as a place of refuge. The finding of this lost city has been regarded as one of the most important archeological discoveries of 300 years.

After the eruption of Mt. Pelée, in Martinique, the society sent out parties of scientists. It did the same thing a few years later when the great earthquake devastated Messina. The society thus aids in gathering, bit by bit, the related facts upon which science hopes ultimately to be able to forecast these dire events.

The Society awarded the Hubbard Gold Medal to Peary for his farthest North in 1906; to Amundsen for achieving the Northwest Passage and locating the North Magnetic Pole in 1907; to Gilbert for his physiographic researches in 1909; to Shackleton for his Antarctic explorations in 1909; to Stefansson, who added one hundred thousand square miles to the world's known area in the Canadian Arctic. It has also awarded special gold medals to the discoverers of the North and South Poles, Peary and Amundsen, and to the builder of the Panama Canal, General Goethals.

When the World War broke out the National Geographic Society was deluged with questions: What is the population of Helgoland? How far is Liege from Paris? How do you pronounce Przemysl? Where is Togoland? What are the Falklands? And so on and on.

These questions came, not only from individuals but from newspaper offices. To handle the demand, it organized a research and information bureau and began to prepare daily Geographic News Bulletins, from 500 to 1,000 words in length, covering the subjects brought up by the day's war news. These bulletins were mailed without charge to 550 of the leading daily newspapers. The service met with immediate favor and was continued throughout the war. When the Armistice was signed, the society felt that the bulletins would not have any special interest for people. But, to make sure, a questionnaire was sent to the editors; and, practically without exception, they asked to have the service continued. This meant considerable expense to the society but when they considered that it was their aim to increase and diffuse geographic knowledge, they saw that it was worth while. These bulletins are regularly providing 12,000,000 readers of the 550 daily papers with a vast people's extension course in geography.

The Geographic Society has also made possible a constructive and far-reaching service to the public schools—a service which supplies 70,000 teachers and 3,000,000 school children with information concerning new boundaries, new nations, and changing conditions at a time when accurate teaching of geography is more vital than ever before. It has, with the co-operation of the United States Bureau of Education, provided the same bulletins for the teachers that they furnish to newspapers. Any teacher requesting the bulletins for school use receives them without charge.

The society, in 1919, instituted a pictorial geography, consisting of 288 of the choicest color and half-tone illustrations from all the volumes of the magazine.

Back Thro' the Centuries to Days of Sumer

Oldest Recorded Writings Translated by French War Veteran

By WILLIAM A. M'GARRY

A SCHOLAR whose special field of research is a language that was dead when the Patriarch Abraham was a boy has recently come to America. His work is in the translation of the oldest recorded writings of human beings, in a tongue so new to modern civilization that not more than six or eight living men have learned to read it. How he learned to read and translate the language without losing the human touch is a narrative of accomplishment that for sustained effort is seldom equaled by the most energetic business man or industrial leader.

The scholar is the Rev. Dr. Leon Legrain, French war veteran. At the beginning of the World War he was professor of Assyriology at the Catholic University of Paris. He still holds that post, and also that of curator of the Babylonian Section, University Museum, in Philadelphia. Within the last few months he has rediscovered the framework of more than 2,000 years of history, written on clay tablets in Nippur, the Holy City of Babylonia, more than 4,000 years ago.

To scientists Dr. Legrain is known as one of the world's half-dozen Sumerian scholars. But his chief interest in the popular mind is that he has humanized archeology. Instead of living in the past he has caught the knack of relating man as he was in the beginning to his descendants of today. Out of the fragile, patched fragments of clay on which were written with painstaking care the daily records of how people lived and loved and died 5,000 years ago, this young scientist is drawing, bit by bit, the story of that mysterious lost race, the Sumerians. Most histories do not even mention Sumer. But archeologists have shown that for thousands of years before any of the patriarchs named in the Scriptures, a non-Semitic race thrived in Southern Mesopotamia, reaching a height of culture and civilization equal in some respects to that attained later by the Greeks. They were the Sumerians.

Without going too deeply into history, it may be said that first intelligible records of this people were found on Babylonian tablets containing inscriptions in two languages. For years after scholars had learned to decipher the cuneiform script of the later Babylonians, the other language on these tablets remained a mystery. Very slowly and through years of controversy it was established that these strange words were those of some ancient people preceding the Babylonians. It was shown also that the Babylonian inscriptions were copies of the earlier ones, meant very evidently to preserve treasures of liturgy and law. Later, at Nippur, at Lagash and at scores of other excavations of ruins in Mesopotamia, tablets were found containing nothing but pure Sumerian.

It is on those tablets that Dr. Legrain is working at the university museum. And the average man who thinks that the abstract scholar has an easy time will probably change his mind after he reads what the scientist has to study to become an expert in this field, and the tremendous amount of detail work he must do in translating tablets. One of the penalties of success in any abstract field is that the man who reaches it must travel far beyond the common understanding of his time. When a scientist arises who can translate archaic facts into matters of general human interest he stands out sharply as a personality.

Any student of ancient Assyrian must begin with the five Oriental languages—Arabic, Hebrew, Syriac, Ethiopian and Assyrian. Before that he must master Greek, as well as his native tongue. Dr. Legrain speaks all those languages, his own French, and also German and English, a total of nine. He was familiar with all those before starting the study of Babylonian, after which came Sumerian. There is a hitch there, however, for the men qualified to teach that language are few and far between. And even the best of the teachers can do little more than start the pupil.

It is now 20 years since Dr. Legrain made up his mind to master Sumerian. By the time he was 21 he was expert in 10 tongues. He has been working at Sumerian directly for not more than 10 years, however. And in that time he has made his own dictionary, a grammar and a pictorial record of the people. To date he has 40,000 words or signs, each on a small slip of paper which he has carefully filed and indexed, and each showing the Sumerian sign for the word. In some instances as many as 60 different meanings are found for one sign.

"The difficulty of Sumerian," says Dr. Legrain, "lies in that, and in the fact that it is a picture language. I do not mean that the word signs are pictures, necessarily, although they were evolved from pictographs. The language itself conjures up general pictures, rather than specific details. It is a reflection of a time so early in the history of man that he had not yet learned to use the spoken word for such minute details as he can today. So his descriptions were general. All of his words, in a sense, were generic and broadly applied.

"How men were able under those restrictions to write the wonderful religious poems and psalms rediscovered within the last few years is one of the marvels of history. For it must be remembered that the scholars of that day had none of the wealth of earlier study and research on which to draw that we have today."

Much has been written about the Nippur collection, but very little about the detail of the labor involved in translating its tablets. When the line reproductions of Sumerian texts are published they look like engravings. One unfamiliar with the process gets the idea that they are copied from the tablets by photography, or by some similar mechanical method.

THE REV. DR. LEON LEGRAIN

What really happens is that every single line is copied by hand with a drawing pen. Archeological research workers become so expert at that that they can accomplish a tremendous amount of work. Merely as an instance, Dr. Legrain has just published a book containing drawings and texts from six hundred tablets from the famous French collection dug up at Susa. He has in his index boxes thousands of drawings from seal cylinders of ancient Babylonia and Sumer. They show that there is hardly any variation of bird or animal used on coats of arms in later days that did not have its origin in ancient times. A symbol frequently used was the eagle. First attempts to produce a frontal view of it resulted in a bird with outstretched wings, and the face of a lion.

Dr. Legrain specializes in history. His first book—the volume that won him the right to be called a Sumerian scholar—was entitled, "The Time of the Kings of Ur."

Readers of the Bible will remember that city as the ancestral home of Abraham. The book came out two years before the war, and Dr. Legrain then was appointed teacher of Assyriology at the Catholic University in Paris. When the war started he went into service as a stretcher bearer, remaining in that branch for two years. He was then transferred to the Thirty-second British Division as an interpreter, in which capacity he served on the front line until the Armistice was signed. At 42 years of age, he is recognized as one of the youngest men in his unusual profession.

Enthusiasm for his work fairly radiates from Dr. Legrain. He has virtually no hobbies. His recreation is his work, and he takes real delight in explaining how each year it grows more absorbing. "The study of Sumerian after one has mastered the Babylonian texts," he says, "is like venturing off first base. You do not know what may happen next. There are three grammars of the language now in existence, one by Dr. Stephen H. Langdon, professor of Assyriology at Oxford, in English; one in French and one in German. Nearly every time I copy a tablet I find some new use of a sign, some new meaning to a sound. All that information is then copied on a small slip of paper and placed in the cabinet containing my own dictionary of the language.

"It is only within the last 20 years that definite progress has been made in the study of Sumerian. It must be remembered that even in the time of Gudea, about 2,500 B. C., this was a dead language. At first bilingual texts of the Babylonians, offering easy translations, were of great help. But we are learning now that the work must have been as difficult for the scholars of later Babylonia as it is for us, and they made mistakes or differed in their interpretations.

"It is true that hours of painstaking detail work are necessary. The labor of copying alone is prodigious. That is done so that many copies may be made of the text, and to make easy the study of the signs. As they are cut into the curved clay of the tablets it is difficult to decipher them. It is better to spend some time making an accurate drawing of the entire text before starting to translate.

"But the work is not dull. It is intensely interesting from the scientific point of view, and it has its human side. What pictures it conjures up of the thoughts and actions of men who were on this earth 5,000 years ago! In the Sumerian text we are finding the originals for many ideas that were thought to be of modern development, and that have merely trickled down through the ages to the present day, many of them through channels now lost to us. Thus Abbé Scheil has written for the *Museum Journal* an account of some passages in Sumerian tablets copied and reproduced by Dr. Frederick Lutz, of the University of Pennsylvania. On these, the work of schoolboys, are found laws in many respects identical with those in the famous Code of Hammurabi, who reigned about 2000 B. C. From these we learn that Sumer had evolved the laws and that the later Babylonians merely copied them. Scholars have shown the relation between the Code of Hammurabi and the Mosaic Code; also the 'law of the Medes and Persians, which altereth not, neither do they change,' as the Scriptures have it.

"Some of the tales that come to the translater of the tablets are far more astonishing than the latest news in the newspaper headlines. Not long ago I found an account of a Babylonian marriage contract. It was customary for a poor suitor to indenture himself to the father of the girl of his choice for seven years. The suitor named in the tablet signed a contract to that effect. Then the father sent his older daughter, presumably under heavy veils, to the wedding ceremony. When the young man found he had been tricked he signed up for another seven years to get his sweetheart, the younger daughter."

Dr. Legrain's description of the source of all this information—the plain of Mesopotomia—gives some idea of what the archeologist sees in store for future explorers. "It is now desert and swamp," he says, "with the tels, as the Arabs call them, rising from the plain. Embankments on the sides of dry canals are so many that the horseman has difficulty in making progress. The tels are sand hills, generally flat on the top, with sharp edges gullied by the winds. And each one represents a forgotten city.

"There is no map locating all of these cities. There is not even a list as yet to show the number, let alone the names, of the entire group. From the tablet records the names of the largest and most famous cities of Sumer and Akkad, the latter the country to the north, are familiar to us, yet we do not know the location of some that were among the largest and most important. Some day they will be found and excavated, and new treasures of literature and information about the life and customs of ancient times will be opened to us."

Various projects have been put forth from time to time for the restoration of the glory of ancient Mesopotamia. Dr. Legrain and other experts assert that it would require relatively little work, since the intricate system of canals is still virtually intact. It would be necessary to dredge some of the dry beds, and to install machinery for control of the water. But, roughly speaking, this famous system is still available for use, although some of its channels have been in existence for more than five thousand years.

Heretofore the excavation of buried ruins in Babylonia has been a hazardous affair, because of the roving tribes of Arabs and the difficulty of doing business with the Turks. The war meant the beginning of the end of that menace. British soldiers are making remarkable headway, through diplomatic treatment, in pacifying and civilizing the Bedouins. It is only a question of a few years, in the opinion of those in touch with the situation, until man will again begin to cultivate the earth that was perhaps the birthplace of civilization.

What treasures those ancient, lost cities will yield can only be conjectured. It is the opinion of Dr. Langdon that Ur of the Chaldees contains the world's first library. Dr. Legrain agrees with him that it is one of the most important sites in Mesopotamia. Some exploration has been done there, but it has been only of a superficial nature. No thorough-going effort has been made to penetrate through all the strata of various dynasties, as was done at Nippur over a period of 12 years by the university museum.

It has been stated that Dr. Legrain specializes in history. When he first came to the University Museum more than two years ago the Babylonian scholars could trace the succession of kings back only to about 2000 B. C. The framework for their lists came from work by earlier scholars on the Nippur tablets. Names of

1922—A Year of "Unfinished Business"

Controversies Extending Through Entire World Go Over Into 1923

By HARRY PENCE

AS IT has drawn to a close, I have, for a considerable period, reviewed the events of every year and endeavored, modestly, to appraise its happenings and developments.

Each of these years has manifested characteristics describable in a single phrase applicable to it and no other.

These tags or labels thus attached to passing years even before they were entirely spent have not been invariably accurate, or rather, it should be said, entirely adequate. A longer perspective, permitting comparisons and the elimination of the unimportant, makes it necessary to revise some of these hurriedly formed characterizations, but in the main they have stood the test of time.

A tag is waiting for 1922 and that tag reads—

"UNFINISHED BUSINESS."

Of course every year has passed on a greater or lesser accumulation of unfinished business, but in this respect this year is particularly noteworthy and from present indications that is its most noteworthy characteristic.

First and foremost must come the matter of German reparations. A full treatment of that subject would monopolize all the space that can be devoted to this article, leaving much unsaid and saying its little with misgivings and uncertainty, for the evidence is conflicting.

One certainty, however, is glaring. The war-devastated areas of France and Belgium are being restored by means and money from other sources and the French budget is the despair of French governmental economists.

Repeatedly throughout 1922 as during 1921 only the refusal of assent on the part of her allies restrained France from the effort to collect by force. Equally persistently, and without avail, her allies have tried to point out to France the inconsistency of imposing paralyzing restrictions upon a defeated enemy and at the same time demanding of this enemy a colossal indemnity. From the French point of view either policy is justifiable but the rest of the world seems rounding to the belief that the enforcement of both is impossible.

As the year wanes the crisis in the Near East has crowded the reparations issue somewhat into the background where, for a time, it must remain, for Europe cannot devote its united energy and intelligence to the vital problem of holding the Turk in check and hope to make Moslem re-entry into Europe endurably safe while the Franco-German agitation continues to ferment. But though temporarily sidetracked there can be no doubt that as soon as this later obstruction is removed France will demand for it the right of way on the main line.

Issue Goes Over Into 1923

THE visit of Georges Clemenceau must be regarded as having this as at least a part purpose, for the burden of his message is that Germany is anxious and is now or soon will be able again to upset the peace of the world; that she therefore is able to meet the demands upon her and would do so if America joined with the other powers in sustaining French demands.

The present purpose is not to sift all this mass of testimony, pro and con, and undertake an authoritative interpretation. The issue will not and cannot be disposed of, even to the extent of an accepted program for its ultimate solution, in the year 1922, which is the fourth year of "the peace," and it will have to go over as a part of its unfinished business.

On November 11, 1921, the third anniversary of the Armistice, the representatives of nine nations assembled in Washington for a conference on the limitation of armaments and the solution of unsettled matters in the Orient and Pacific.

Adjourning that day to participate in the ceremonies attending the burial of the Unknown American soldier in the national cemetery at Arlington, Virginia, this illustrious body of men gathered on November 12, a date that ought to be and may became memorable in world annals, for it was then that Secretary of State Charles E. Hughes, head of the American delegation, flew in the face of all diplomatic tradition and opened an international conference with a bold, a definite, a concrete and a comprehensive plan for a naval construction holiday, or vacation, of 10 years.

Unprecedented in substance as well as procedure this proposal provided for such reductions in the capital ships of this country, England and Japan as would necessarily relieve these nations of a great financial burden and at the same time maintain an equitable ratio of relative strength.

Japan for a time held out for a larger allotment and France, when the provisions of the proposed pact were extended to her and to Italy, resented her relegation to comparative naval insignificance but before the passing of 1921 the consummation of this agreement, so far as the conference was concerned, was assured.

The conference stretched into 1922, holding its final session February 6, when the treaties it had formulated were signed.

These pacts included, besides the celebrated limitation of capital ships on the part of America, England, France, Italy and Japan, an agreement that the submarine must not be used as a commerce destroyer, even against merchant ships of the enemy in war, the abolition of poisonous gas in warfare, a four-power act concerning the rights and movements of America, England, France and Japan in China and environs, an agreement between Japan and China for the return of Shantung and the removal of other causes of friction, the settlement of or the erection of machinery for the settlement of other issues concerning China and the Far East.

Although all effort to limit land armaments was abandoned when France insisted that her peculiar position required the maintenance of a great army the achievements of this conference were monumental in dimension and significance.

But they nevertheless still belong to the world's unfinished business of 1922. The United States began the operation of her parts of the various pacts immediately by quitting work upon uncompleted warships and the Senate, with more promptness than might have been anticipated, ratified the treaties, the last pact receiving this sanction March 30. England and Japan also officially ratified and have been carrying out the provisions of these agreements.

As this is written, however, France is still debating her ratification with much opposition developing against it.

France is still resentful because it was not possible at Washington to obtain an alliance with this country or a binding obligation to co-operate with her in event of war with Germany, or at least so flows the current of unofficial diplomatic opinion, and the French sustain the advocates of dissent who insist that her quota of capital ships is insufficient.

Even if she ratifies the treaties, Italy has passed into the hands of a government pledged to the utmost aggrandizement of Italy's territorial and martial aspirations. With internal complications of staggering proportions to face, with quarrels with her neighbors imminent, if not inevitable, and with a vital interest in the Turkish tangle, it is not to be expected that she will enter into any restricting obligations in the interest of world peace.

At the outbreak of the Near East storm our own Navy Department halted her scrapping of warships and in recent weeks the British admiralty publicly proclaimed her purpose to do the same in a statement expressing regret that she had already outstripped the other countries in discarding important units of her war fleet.

The unanimity with which the nations involved sought mutual justification for abandoning a pacific policy at the very first threat of international discord can but instill doubt as to the power of agreements formulated in peace to bind countries facing an immediate fear of war.

In July, 1921, that great international peacemaker, Jan Smuts, of South Africa, visited Ireland. By what suasion he accomplished his end he never fully revealed, but the result was a series of conferences which resulted in the leaders of the Sinn Fein movement accepting a compromise by which the southern counties of Ireland remained in the British Empire on the status of a dominion with self-government similar to that of Canada, Australia and South Africa.

This pact led to a division among the Irish, the more radical of them following the former leader Eamonn De Valera in opposition to any settlement short of independence. At the end of the year the Dail Eireann, the national assembly of South Ireland, was in adjournment without a decisive vote on the issue.

On January 7, 1922, the Dail Eireann ratified this agreement and a few days later set up a provisional government in conformity with it. De Valera withdrew and devoted his efforts to a defeat of the Free State movement by the people in the forthcoming election.

Guerilla War of Erin

ENGLAND released all Irish political prisoners and declared an amnesty, British troops were withdrawn and in March the House of Commons passed an act approving the Free State, but reserving the right to pass upon the constitution which the Free State was to adopt. England also co-operated in negotiating a program for the settlement of the inevitable border controversy with Ulster.

Taking advantage of every opportunity for obstruction the republican opponents of the Free State precipitated a border warfare with Ulster and it was not till May 20 that the rival factions came to an understanding about the election.

This election on June 16 resulted in the selection of a working majority of Free State adherents to the Irish assembly but the rioting that attended the elections continued until, a month later, after a hundred or more had been slain, and several hundred injured, the Free State organized an army to cope with the situation.

Driven from other larger cities the republican forces made a stand in Cork and great damage was done there when they were forced to evacuate on August 10.

Guerilla warfare has followed. The Irish cause suffered a serious loss in the death of Arthur Griffith, formerly an enthusiastic Sinn Feiner, of which movement he was the reputed founder, but afterward a leading Free State supporter, who died as a result of overwork and exposure August 12; and another blow to the cause was the assassination of Michael Collins, head of the provisional government, August 22.

W. T. Cosgrave succeeded Collins September 9, and work on the Irish constitution continued until that fundamental law of the Free State was finally formulated October 12. By an odd irony of fate this constitution is now pending ratification at the hands of a British ministry and parliament dominated by the party that has always opposed any liberality of policy toward Ireland. At this time its ratification without consequential modification seems certain, but even with the form of government officially settled government in fact is still far from established in that part of Ireland which has so long been in rebellion against English domination.

The restoration of industry and establishment of civil rule and education must wait upon restoration of peace, and the republican forces still have an "army" in the field. Its chieftains declare that the Free State ignores the "established laws of warfare," denounce the military tribunal erected to try insurrectionists and proclaim as martyrs the leaders of their armed opposition who have been executed, instead of being held as prisoners of war. Ireland, that is, Southern Ireland, has, for the present, given up fighting the English and seems to be divided into two hostile and desperate armies fighting one another, one for a limited and attained freedom, the other for outright and complete but unattained independence.

The Free State of Ireland has a government that as yet does not govern Ireland and this also is an item of unfinished business which the year 1922 passes along.

He who undertakes to speak of China risks being party to the dissemination of more misinformation than fact. The wonderful people that comprise one-fourth of the world's population and possesses a civilization which, even if it does not conform to our concepts of civilization, has for ages become so traditional that no political division, no foreign invasion, military, commercial or cultural, can make an appreciable impress upon its adhesive unity—to such a people the happenings of the last few months seem but passing incidents. Yet empires have been wrecked by smaller disturbances.

The dismemberment of China has been connived at and, it is frequently asserted, practically agreed upon in the chancelleries of old Europe but more than mere fear of a disturbance of the balance of power, more than mutual jealousies as to the distribution of the dismembered fragments blocked this stupendous game. Its immensity alone sobered the dismemberers and restored their sanity.

The Situation in China

CHINA has never had a strongly centralized government. Its size and the difficulties attending travel and communication have made it impossible. The governors or the rulers of the various provinces have therefore wielded power in proportion to their ambitions and their capacities. A superman among them might dominate China, but it would require a superman, for his first aggression would engender a coalition of lesser chieftains in opposition.

This was demonstrated when in January of this year General Wu Pei-fu, governor of Hunan and Hupeh provinces, demanded changes in the cabinet of the government at Peking. The matter simmered but did not evaporate, as subsequent events revealed, for General Wu of Hunan and General Chang Tso-Lin, governor of Manchuria, cherished different ideas and plans for the unification of China by an amalgamation of the government at Peking and the South China Republic of Dr. Sun Yat Sen, with headquarters at Canton.

These differences baffle occidental comprehension, but the individual ambition of neither champion of unification was entirely submerged in the crusade. Each sought the co-operation of South China but Dr. Sun joined fortunes with General Chang, who in April moved on Peking in his campaign of benevolent assimilation.

General Wu promptly took the field in opposition, defeated General Chang in battle May 4 and 5 and dictated the resignation of the premier of China. On June 1 he brought about the overthrow of President Hsu Shi-chang and on June 3 former President Li Yuan-Hung, who was deposed in 1917, was restored to such power as remained attached to the title and office.

A brief truce interrupted the fighting but the war soon shifted to South China where the government at Canton was overthrown and Dr. Sun became a fugitive. In July and August fragmentary reports from China, obscure and often conflicting, suggested that the factions, eliminating General Chang, who had retired to Manchuria and declared the independence of that province, had opened negotiations for a settlement.

It was further reported that this settlement contemplated the establishment of a federation of the Chinese states in a union and under a constitution modeled upon that of the United States of America and that this movement was under the leadership of Dr. Sun.

Subsequent dispatches have thrown doubt upon the reports that Dr. Sun had recovered any degree of leadership. This turn of affairs has been a disappointment to many Chinese in foreign lands, especially in America, for generally their interests and sympathies have been with Dr. Sun.

To hazard speculation as to the ultimate outcome of the Chinese civil war of 1922, especially since uncertainty exists as to whether the actual warfare has terminated, would be folly.

It can, however, be said with authority, that China owes and realizes that she owes her difficulties to foreign interference. It is also certain that her leaders realize the necessity of modernizing her government and her industries. Much progress has already been made in this direction.

In both she feels the need of borrowing ideas from the outside world. Her contact with the outside world has not tended to inspire liking or confidence. Of all the nations with which she has been compelled to deal America alone has not sought to take advantage of her backwardness to exploit her resources. America excludes her immigrants, it is true, but she welcomes her students. That stream of Chinese students to the

Drowning Jazz With the Chimes of Normandy

People of San Francisco Bay Region Respond to Revival of Operas of Generation Ago

By
HARRY H. DUNN

OUT on the Pacific Coast, normalcy in music, songs, humor, and theatrical entertainment seems to be returning. In the midst of a group of cities set round the shores of San Francisco Bay, a 12-week season of revivals of comic operas of 15 to 25 years ago has been so successful that it has been extended to 18 weeks; arrangements are being completed to make this offering of clean fun, beautiful music, tuneful songs, and jazzless melodies a permanent annual event, and civic, commercial and social organizations are uniting to supply a theater which shall be the home of the stock company which has driven out syncopation with songs from "The Chimes of Normandy," "Wang," "Robin Hood," "Woodland," "The Mikado," "The Idol's Eye," "The Wizard of the Nile," and a score of others that once were the leading musical shows of the world.

The season began late in May and has attracted so much attention and so great attendance that it is now "making money," to turn for a moment to the financial side. Musical and dramatic critics of the Pacific Coast press take this to mean that the people are beginning to demand something for their money besides groans from the trombone, wiggles from the chorus and jokes of double and doubtful meaning from the comedians. Attendance has averaged from 1,500 to 2,000 every night at the theater in the municipal auditorium in Oakland, where this musical show revival is being conducted. And a rather careful checking over by the business management indicates that approximately half the audience is composed of boys and girls, younger than 20 years of age.

That is to say, these clean musical shows are *new to this generation,* and as attractive to them—even more attractive—than the less clean productions sent out from Broadway to pollute the dramatic atmosphere of this country. It indicates that *when the opportunity is given* the youth of this generation, they will attend and enjoy the old and the clean shows, to the exclusion of the degenerate modern type. This is an important discovery which has been made out at Oakland, for it disproves the argument so often advanced by modern producers, modern managers, modern playwrights, modern composers, that "the people demand the music and the songs and the shows of the underworld and we must give them to them."

Ferris Hartman as the Toymaker, in the revival of the comic opera of the same name.

MISS LILLIAN GLASER,
Prima donna for the company.

Ferris Hartman, for some years retired, and, many years before that, the leading comedian of the Pacific slope, playing from Vancouver to San Diego in the very vehicles which he has now revived, is largely responsible for the victory of melody over jazz. With him is Paul Steindorff, choragus of the University of California, a conductor and composer of note, to whose firmly grounded belief that the syncopated music of the days since the war is a passing phase of life, is due not a little the organization of the stock company which is putting on these revivals. Back of these two stand the business and professional men and women of Oakland, the Chamber of Commerce, the Merchants' Exchange, the Builders' Exchange, the Real Estate Board, and even the city government, which has promised to extend every aid to the permanent establishment of the company in a theater.

Hartman has made of Gaspard and Wang and the Blue Jay and Abel Conn and all those old comic-opera heroes of standing, characters that live again as vividly as they did in the years of a generation ago. Steindorff has produced a chorus in which voices and legs are at least equally symmetrical, with the possibility of the voices getting somewhat the better of it, with the result that the singing is a separate and distinct joy in each production. Another factor in the popularity of these revivals probably is the cost of admission, the highest-priced seat selling at $1, with a book of 12 tickets for these best seats offered at $10, and good any night.

"If we are to compete with jazz," says Steindorff, "we must furnish something better than jazz, and sell it at the same or a lower price." There must be some force to this argument, for before the curtain went up on the première production of the season—which was "The Idol's Eye"—enough of the $10 ticket books had been sold to guarantee the costs of production for the whole 12 weeks. This means that all individual seat sales, outside the ticket books, and many ticket books bought afterward, gave clear profit.

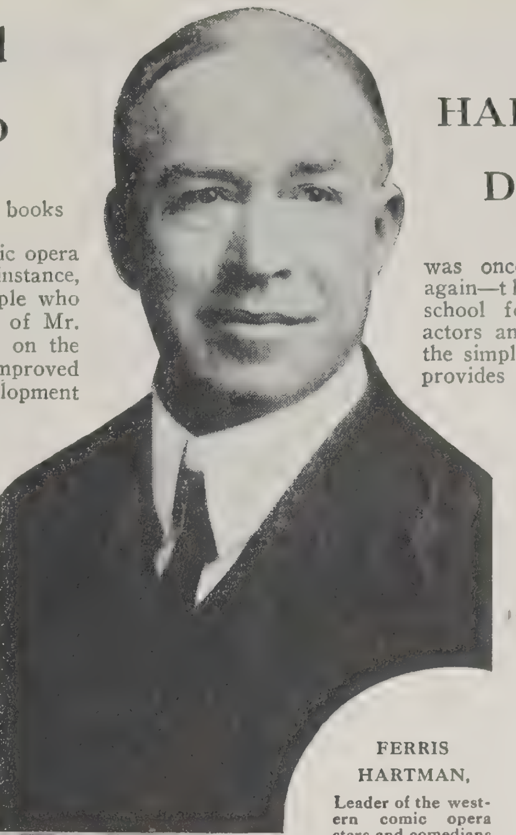
Back of all this movement toward the comic opera successes of another day, local in this individual instance, but apparently general in the minds of the people who make up the audiences, there is, in the opinion of Mr. Hartman, a demand for new and better talent on the stage, which will supply such an outlet for improved dramatic ability as to make possible the development of actors and actresses, singers and comedians comparable with those of 15 or 20 years ago.

The writer, whose last memory of Hartman was of at least 25 years ago, in the old Grand Opera house in Los Angeles, when the noble Elephant broke in two in the middle of "Wang," found the comedian curled without regard to years or joints on a table just off stage, listening to Lillian Glaser rehearsing "Just Look at This," in "The Chimes of Normandy."

Hartman has decided opinions on the stage, the audience, the worthlessness of jazz and a number of other things, and he speaks these opinions right out on the stage or off it.

"Some pessimists," said Mr. Hartman, "claim the stage is going into a decline. This is not true. The simple fact is that there is as good material for the making of capable actors and actresses today as there ever was, but this material, scorning to stoop to the baser effort needed to attract attention now required of the actor or actress, has been latent, has not sought expression on the stage. In other words, artistic talent on the stage—in drama or in musical shows, in comedies or in musical comedies—has had no outlet for itself. The time has come for the opening of that outlet, and to say that the people will not patronize the best on the stage is equivalent to saying that they will not read the best in books, that they will not buy the best in pictures, that they will not furnish their homes with the best in furniture, or that they will not supply themselves with the best of food. All these other necessities and luxuries of life have been and are being supplied to them in the best form, but the best the stage is capable of producing has not been supplied to them—and, if they sought entertainment, they had to accept what was offered, an offering which for the most part has not been even mediocre, far from being the best. Offered the best, the people will take the best, you can be well assured of that, and on that premise our offerings are based.

"The old-time stock company, which is coming back, was once—and will be again—the training school for the best of actors and actresses, for the simple reason that it provides the only opportunity for one person to play many rôles, thus developing versatility, and familiarity with many characterizations, some of them diametrically opposed to others. My opinion is that the salvation of the stage lies in the stock company, partly because its limitations are such that it must present standard plays, partly because its stability attracts the best and most earnest of the player-folk, and partly because its audiences, becoming familiar with and friendly to each member of the stock company, voice their demands for the better productions. There is many a prima donna, many a comedian in the million or more people who live around San Francisco Bay, just as there is in every other large center of population, but the door of opportunity is closed to them because they are not jazz dancers or contortionists, or will not stoop to unclean comedy to 'make a hit.'



FERRIS HARTMAN,
Leader of the western comic opera stars and comedians of some years ago, heads a successful revival of the old-time favorites.

"In the cycle of popular favor as entertainment, musical comedy is coming back to its own—our experiment here in Oakland proves that. There is no cleaner, more enjoyable form of entertainment, and it seems a shame that the public has been denied so long the pleasure of seeing and hearing those melodious gems which will never grow old because they possess the heart and soul of eternal, clean-living, clean-thinking, clean-laughing youth. Had Ponce de Leon only known it, he could have ended his search for the Fountain of Youth by going into comic opera. We are trying, here on the Pacific Coast, to revive and perpetuate those old operas, and we believe we are succeeding. We believe, the whole company of us, that we are giving the people something in the place of jazz shows, and the attendance assures us that the people are accepting the substitute, and enjoying it. With this revival of the old musical shows, we are trying, also, to bring back some of the old spirit of beaming friendship and jovial good nature that marked the patrons of the old Tivoli, in San Francisco, for years before and up to the great fire of 1906. That was a get-together feeling, where everybody knew everybody else in the audience and where to become a regular attendant at the comic operas was like joining some neighborhood social club. You know, you cannot have that feeling of brotherhood, that sense of neighborliness and friendship, when you go to a modern scrambled-up jazz show; it isn't put together for that purpose, and the prices charged make the seat you occupy a sort of standard of your financial ability—or common-sense inability—whichever way you look at it.

"The point of attraction in the comic opera is that it is essentially human; it points the foibles and the fads of men and women as they are; it has the appeal of ordinary manhood and womanhood, with all its errors and mistakes, to the manhood and womanhood out in the audience. This is an appeal no jazz and dance and low-comedy show ever can have, because to the average man and woman these things are unreal; they are not parts of their daily lives, they are introduced from an underworld of unreality to the average man and woman, and they can have no permanent attraction for the majority of those persons of either sex who make up the great American nation.

"It is my belief that jazz, a musical abnormality brought into being by abnormal conditions, and kept alive by those who sought solely to make money out of it, will pass as rapidly as it came on, and that it already has begun to leave us. It is necessary, however, that a clean form of entertainment be offered in its place. I think the musical comedy, the comic opera, with good music, melodious songs, presented by competent actors and actresses is supplying that very need, and supplying it rapidly."

That Billion of Gold—Who Owns It?

Another Mystery for the Metal Money-standard People to Solve

By W. H. ALLEN

THE turn of the golden tide in 1921 has brought to our shores more of the yellow metal than ever came in any similar period of our history. The movement has furnished a basis for innumerable boasts and predictions of the great benefits that were to flow from this huge addition to our metallic wealth. We were told by financial forecasters that money would be cheaper, and easier to borrow, and as there would certainly be a vast increase of purchasing power there naturally must be a great revival in all lines of trade industry.

And, according to all precedents, there were valid reasons for this optimism. In every former period a large increase of gold has brought easier money conditions, more loanable funds, greater demand for farm products with resulting increase of the farmer's buying power, which in turn causes a wider demand for all kinds of manufactured products, thus promoting general prosperity in every line of trade and industry.

According to the National City Bank bulletin (May, 1921), this gold came here in payment for merchandise exports. If that were true the bulk of it should have gone West and South, and it would certainly have produced this great revival of prosperity. But it did nothing of the kind. To begin with, there was no big shipment of gold to these sections, and the influx from abroad was not followed by easier money conditions. Tight money seems to have prevailed all over the West and South in 1921 while this great amount of gold was coming here. Here are a few items from New York publications which bear out this conclusion.

"In New York, money on collateral for 90 days is from seven and one-half per cent to eight per cent. Call money is six per cent to seven per cent. Money is tight the country over and while liquidation is going on in some lines, requirements elsewhere are increasing." National City Bank bulletin, March, 1921.

It Didn't Get Out West

KANSAS CITY, March 10. "Credit Stringency Grips the West. Debtors want accommodations till the next harvest."—New York *Post.*

Kansas City dispatch, May 12. "Narrow market for western securities; county and municipal issues can only be floated at high rates. Several issues this week have been sold on a basis of six per cent which is the highest rate paid for money in many years."—New York *Post.*

Kansas City dispatch, April 21. "Western business still marks time; wage problems, frozen credits, dear money and curtailed buying delay stabilizations." —New York *Post.*

Chicago dispatch to New York *Post,* November 24. "Credit tight in the West and farm debts only partially liquidated, while prices for products still decline. Great need for long-term accommodations."

That was the situation pretty much all over the West and South in 1921. Even here in the East, where most of this gold is stored away, the money situation was not much better except at times in Wall Street. For instance:

"Money is not as tight as in 1920, but it is dearer and far less easy to obtain than in 1919 or in war time." New York *Times,* July 4.

During the latter part of May "the money pool which was the dominating factor during the war and after the Armistice was again called into operation in the last two weeks. Heavy calling of loans was noted in every day of the last week with the greatest disturbance to banking accommodations coming after noon yesterday, followed by an advance in call money to seven and one-half per cent, the highest rates reached since last February. The time money situation narrowed down to the smallest *amount of business known* in generations." —New York *Post,* May 28.

Money rates grew somewhat easier later in the year but not so much as might have been expected *considering the great influx of gold.* And general business continued to grow worse right to the end of the year and for months after.

Figures in Failures Tell Tales

STATISTICS compiled by R. G. Dun show 19,652 insolvencies for indebtedness aggregating $627,401,882. This is exclusive of banking suspensions and personal bankruptcies. In 1920 there were 8,881 failures with indebtedness of $295,121,805. In the last quarter century there has been only one year, 1915, when the number of failures exceeded the number for last year. But the total liabilities for 22,156 failures in 1915 were only $302,286,148. The increase of commercial mortality was marked in every section of the country. The year's defaults were 92, eight per cent larger in number than those of 1920 in New England; 81, nine per cent greater in the Middle Atlantic states; 186, three per cent more numerous in the South Atlantic group; 195, five per cent in the South Central division, and 143, six per cent in the Central East. In the southern district of New York, 2,355 bankruptcy petitions were filed during the year. This is 853 more than in 1920, and is the largest number filed in any year in a decade.

What is the explanation of this paradoxical situation—these high money rates and declining trade and industry in the face of this huge increase of gold?

The banker's explanation is that it is all due to Europe's poverty, the exhaustion of her buying power and the need of our aid. But in most cases, dull business causes idle money to pile up in banks. There is a falling off in the demand for loans and interest rates decline. But as already noted none of these conditions prevailed last year. Again, despite Europe's poverty *she sent us this seven hundred thousand in gold* and her buying power should have been greater than in any former year, and very much greater than in any year but one in our history. But apparently it had no more effect on general business or money conditions than if it had been dumped into the Atlantic Ocean. Commenting on the negligible effect of the great influx, the Mechanics and Metals Bank bulletin (May, 1921) says: "To date it has not altered materially the terms quoted for credit in the money market. *Commercial money rates* are not noticeably easier, generally speaking."

Now the solution of this mystery of dull business, and money scarcity, in the face of an enormous influx of gold, carrying with it a potential expansion of credits of 10 to 1, is to be found in the simple fact that **the new gold is not American owned.** It did not come here in settlement of commercial debts. It represents *financial,* rather than *commercial,* transactions. Referring to the great influx of 1915, a leading financial authority said that most of the gold was coming here for sure investment, to establish working balances with other countries, and for safe-keeping. This statement also applies to the movement of the past two years. Part of the gold will be used to establish balances with other countries in South America and the Orient; and part will be used for investment purposes and for safe-keeping. Germany, for instance, has sent a good deal of the gold here to keep the Allies from seizing it in case of threatened difficulties. It is much easier to make it appear that the coin is not German owned if it is lodged in New York banks than if it is in Germany. Besides it lends plausibility to her plea of poverty when appealing for postponement, or for reductions in the amounts to be paid.

The fact that much of the gold is really foreign owned is clearly shown by such statements as these: "One reason for the easier money rates is that the governments of Great Britain, France and Canada are money lenders at present, having established credit balances by shipments of gold to New York. The latest shipment arrived yesterday on *Saxonia*: it amounted to $4,000,000. It was the third shipment in three weeks, the total amount exceeding $14,000,000." (From the *Herald,* December 3, 1920). Discussing the "renewed money tension," the *Post,* October 1, 1921, remarks that "Holdings of cash for account of foreign governments reached an *aggregate far beyond any estimates* that have been made." The Canadian Government just now is carrying large amounts of cash in this city. (British Canadian banks had also at their last reports $190,000,000 invested in call loans at New York.)

These items suggest several questions:

(1) If, as Treasury officials constantly assume, all the gold that comes here is American owned, where do foreigners get so much to lend here?

(2) If foreigners are so poor, how is it that they can afford to lend here?

(3) If we are such a rich creditor nation, why in heaven's name do we need to borrow at all?

Showing It's Not U. S. Owned

THE National City Bank bulletin (May, 1921) says that the gold is not being used as a basis for credit and is not needed for that purpose: but on the opposite column it says that "the Boston (Reserve) bank has been lending to the Reserve banks of the South and West. There is a desire to make conditions as easy as possible in the agricultural districts *where conditions are very tight."*

These several statements do not dovetail with the theory that any considerable part of the new gold was American owned. On the contrary, they give more support to the belief that the gold is foreign owned and was sent here for investment, or to establish working balances, or for safe-keeping. And the first payment of the German reparations goes far to confirm this belief.

When it was announced that the first payment of the German reparations, $80,000,000, was to be made at New York, people wondered where the money was to come from. Bankers had insisted all along that Germany had no funds here available for that purpose. Thus the *Tribune* of March 18, 1921, stated there was little German wealth here: and it quoted bankers as saying that what little cash there was belonging to Germans could not be made available for such payments. (Two years before, in 1919, the same paper quoted bankers to the effect that German holdings of our securities amounted to only $5,000,000.) But at the appointed time the money was promptly handed over to agents of the Allied nations.

Now come the curious features. Instead of causing trouble on the German money market, as might naturally be supposed, the payment seems to have *caused most trouble here.* For weeks before and after May 31 *our* money market was upset and rates were high. It was on May 28 that the time money situation narrowed down to the smallest amount of business known in generations, and call loans were up to seven per cent. The rates were higher still for several weeks after, and the stock market experienced two or three near panics as a result. During this period, money was reported as being easier in Germany, and bankers there explained the plentiful supply as being due to foreign loans; *rates in Germany were as low as four and one-half per cent as against seven and one-half per cent in New York!*

The payment of the first installment of back interest on the British debt to this country (October 16, 1922) was still more of a mystery. The transfer of $50,000,000 gold, equal to $500,000,000 in credits, from London to New York *should have made money dearer in London and cheaper in New York.* But much to our surprise it appears to have *had the opposite effect.* Thus when the payment was made, *money was five and one-half per cent in New York and only one and one-half per cent in London.*

Another freak incident of the day was a marked decline in Liberty bonds, in spite of this addition of $50,000,000 to our Government's resources. The payment of the second installment of interest on this debt (November 15) seems to have brought a second installment of grief, as the stock market reports announced that "calling of loans helped bears, selling of bonds renewed." "Liberty loans decline to new low records, and market closes unsettled."

This calling of loans was done by the agents of the British Government whose funds were being loaned on the Stock Exchange, as noted by the *Herald,* December 3, 1920, and the *Post,* October 1, 1921. The funds were part of the gold which had come from abroad. If the gold had come in settlement of commercial debts, as the National City Bank bulletin asserted, it would have gone West and South where it was needed to relieve the strain in those sections. But, instead, we find it lodged in financial banks that furnish about all the funds available for Stock Exchange speculation. *And it is all foreign owned.*

German Credits Held Huge

I ADVANCED this theory of the matter in several articles in the *American Economist* (June 21, 1921 and February 17, 1922) and it was confirmed by information gathered before and after those dates. A statement given out by Treasury officials (March 16, 1921) was to the effect that *"the Reparations Commission had decided to have German payments made in this country so as to enable Germany to call upon the vast credits which it is said to hold through private agents in the United States. Information gathered by Reserve banks showed that since the Armistice Germany has been amassing credits in United States National banks, holding the funds in the names of individuals."*

In his address at Williamstown, Massachusetts, July 20, 1922, Raymond Recouly, editor of *Reveu de France,* claims that Germany has sent to foreign countries for investment 10,000,000,000 German gold marks.

It is not easy to determine the exact amount of German capital abroad because it is designedly hidden from public view. The movements of such capital are camouflaged the same as they were during the war, when $1,700,000 was traced from the Reichsbank in Berlin to the Deutsche Bank, thence to Ainsinck & Company, where it appeared as German funds, then to the Royal Bank of Canada, the deposit being made by the cashier's check, which concealed its origin, and thence to J. P. Morgan & Company, and Madame Bolo in Paris, the German clue being still further lost in these moves.

But the Reparations payments let in a great deal of daylight on the question and forced the bankers to admit that Germany had more credits here than they had led people to believe. Professor L. V. Birk, of the University of Copenhagen, claims that Germany has from $1,000,000,000 to $2,500,000,000 invested in call loans in other markets. It is a safe guess that the most of this money is invested in the United States and forms part of the "vast credits" which Germany has here.

Furthermore there is much to prove that other foreign bankers are investing large sums in call loans and in our stocks and properties. This evidence, as already noted, is to be found in the regular stock and money market reports.

But the amazing thing about it is that our Treasury officials at Washington do not appear to have the slightest knowledge of the facts.

From the Banks to Allies

THESE officials must know that the money for Reparations payments was taken from our banks and handed over to the Allied agents who deposited it in the Reserve banks. *And yet these same officials in their reports assume that all the gold in these banks is American owned.*

If, as this statement of March 21, 1921, says, Germany has vast credits in the United States, then all such credits call for payment in gold and hence *constitute a lien on our gold stock.* The reports give the total stock of money in the country on June 1, 1922, at $8,128,000,000. Of this amount, $3,774,000,000 is gold coin, bullion and gold certificates; and $589,000,000 of it is supposed to be in hand-to-hand circulation.

But it is safe to say that there is not one-twentieth of that amount outside of the banks. And these institutions never pay out any gold.

A good part of this gold and certificates has been carried out of the country by migratory aliens. In 1913, $400,000,000 of the metal was in savings banks in Italy, according to their last reports.

Other large amounts, in the shape of gold certificates and national bank notes, are also held abroad.

It is also assumed that the product of our gold mines is American owned, in spite of the well-known fact that foreigners, mostly British, own most of our largest mines. British capitalists put $500,000,000 into these properties between 1880 and 1894.

The product of Canadian mines which comes to New York is also counted as ours, although it is lodged in British-owned banks and invested in call loans.

(Concluded on page 11)

The Mysterious Killing of Major Cronkhite

Concluded from page 3

cause he had snapped the trigger once or twice, without any resultant discharge from the weapon. The time for luncheon having arrived, he informed the major. They picked out a place, and having reached it, the captain, who was with the regiment, about 50 yards behind the commanding officer, called out to him and suggested that it was the appropriate spot. The major, he said, turned around and signalled to hold the place.

Major Cronkhite then, according to Captain Rosenbluth, drew his revolver and shot it off. The captain said he feared there had been an accident, because no shots had previously been exploded, and so he ran toward his commander. He asked the latter at what he had been shooting, and the major responded that he had aimed at a tin can on a post. The captain commented that it had been a clean miss.

Immediately afterward, so said Captain Rosenbluth, the major raised his weapon and fired again, the can dropping from the post. He stated that the young officer lifted his weapon once more, and, turning or twisting to the left, observed "that he had got it that time." The captain reasoned that the major's extra movement must have twisted the pistol down, for the weapon went off, the bullet penetrating his breast. "My God, I'm shot!" exclaimed the major, and fell back into the captain's arms. Sergeant Bugler Pothier, he added, was possibly four to six paces away at the time. The shooting occurred at about 11 o'clock in the morning.

Pothier's story was to the effect that the major and he were walking through a path in the field, when Major Cronkhite, picking up an empty tobacco tin, placed it on a fence post, saying that he was going to try a shot. He shot and missed, while Pothier turned around and looked for the company.

Sergeant Bugler Pothier Describes Supposed Accident

THEN, continued Pothier, the major fired another shot, saying to Captain Rosenbluth "that he had got it that time." The sergeant bugler stated that he turned around to see whether Captain Rosenbluth was near by, at the same time hearing another shot, followed by a statement from the major, saying that he was shot. He was about six paces away. He did not see Captain Rosenbluth until after the major was shot, and then the captain had run up and was taking the major's pack and coat off.

The sergeant bugler said he then assisted the captain in his task. He was not quite certain how many shots the major had fired, but he believed there had been three reports, and the third report had sounded just as loud as the others.

Such were the stories of the two witnesses, told shortly after the death of Major Cronkhite.

The finding of the Military Board had been: "That the death of Major Cronkhite was in the line of duty. That death was not the result of the deceased's own willful misconduct."

To all appearances the case was closed, and time passed—a long period of time.

At the entrance to the old Schuffert farm in Camp Lewis, a cenotaph was erected to the memory of young Major Cronkhite, who had been born in Fort McHenry, Baltimore, in the very shadow of the monument of Francis Scott Key.

Major-General Adelbert Cronkhite, the stricken father of an only son, was fighting for his country on a European battleground. He had won the Distinguished Service Medal in January, 1919. In June of that year, he received the Cross of Knight Commander of St. Michael and St. George. In the following year he was appointed major-general. He had returned to the United States.

Sergeant Bugler Pothier, obtaining his discharge from the army, had flitted into the wide unknown.

Captain Robert Rosenbluth had left the country to travel in Russia and Turkey.

There is some mysterious law, operating since the earliest days of civilization, which keeps fresh the memory of a human being over whose death hovers the cloud of suspicion. The beautiful legend of the "Cranes of Ibycus" became a proverb among the ancient Greeks as a sign of the agency of Divine intervention in revealing crime.

Medical Experts Hold Cronkhite Could Not Kill Self

NEITHER the comrades of Major Cronkhite, nor the heads of the Department of Justice, had been satisfied with the explanation given of the young officer's death, as being due to "accidental shooting." For two years, agents of the department worked in accumulating evidence bearing on the major's death, in tireless investigations, from day to day, from week to week, from month to month.

One of the chief reasons for these researches was a sinister fact which has often loomed large in the annals of criminal cases. It was the opinion of experts, who had examined the official autopsy in the surgeon-general's office, that it would have been impossible for Major Cronkhite to have shot himself in the manner described.

So profound became this conviction, that the remains of Major Cronkhite were exhumed.

On July 9, 1920, in the crypt at the chapel at West Point, an autopsy was performed upon the remains by Dr. O. F. Schultze, who, in the practice of his profession, had performed 5,000 autopsies, many of them in cases of bullet wounding, and had witnessed numerous experiments in observing effects of the discharge of bullets at various distances from various arms. One-time medical assistant to the district attorney of New York County, he became member of the faculty of the Medical College of Cornell University, first as instructor in pathology, then as assistant professor in pathological anatomy, and later as professor of medical jurisprudence.

The official diagnosis of Dr. Schultze was as follows:

From the observation of the bullet wound, from entrance on the right side of the chest, through the third rib, one and one-fourth inches from the armpit, and the course of the bullet through the organs of the chest, to the left third rib, in the middle of the armpit, in my opinion, the wound could not have been self-inflicted with a firearm in the hand of the deceased."

A search was instituted for the two men who had been present at the death of Major Cronkhite. On March 19, 1921, Pothier, the former sergeant bugler, who had been found working as brakeman on the New Haven Railroad, was arrested, charged with the killing of Major Cronkhite. He made a confession, admitting that it was a bullet from his weapon that had caused the young officer's death. Arraigned before United States Commissioner S. A. C. Matteson, at Providence, Rhode Island, he at once pleaded guilty to involuntary manslaughter, and was committed to jail.

On March 23, Rosenbluth, one-time captain of engineers, was arrested in New York on a similar charge, and locked up in police headquarters. He maintained his innocence.

It is an axiom at law that no innocent man would be at all likely to plead falsely to the charge of slaying another man. Captain Rosenbluth had given sworn testimony that he had been standing close beside Major Cronkhite during the firing of the second and third shots. The third shot resulted in the death of the young officer, and Pothier had confessed to the firing of that shot. The inference was obvious. Captain Rosenbluth must inevitably have been aware that Pothier had shot the major, and therefore his sworn testimony was held to have been false.

Here ended the first phase of the Rosenbluth-Cronkhite case. But the developments of the second phase, as will be shown, were still more significant.

It is necessary to call the attention of the reader to an event which became known on September 19, 1922, and which is destined to have an important bearing on the mystery. It was discovered that fire had burned over the scene of the fatal shooting of October 25, 1918, and that many features that were of value as evidence had been wiped out. The barn and posts referred to were burned down; the houses and fences all destroyed.

What Caused the Fire That Did This Destruction?

Much thought has been given to this suspicious fire which destroyed the entire farm buildings and equipment. From soldiers and men employed in logging on the reservation, close to the farm, it was gathered that the fire occurred in August—the late summer, they say. It was noted that north, east and west of the buildings, there are extensive open spaces, across which the fire did not approach—sparks could not come from a forest fire to the east or north of the farm. They did not come from the west, as the trees are not burned there, and besides, the fields back of the buildings show no sign of having been burned over.

The orchard was not touched by the fire. This leaves the south as the only side from which the fire was communicated to the buildings, and the strange thing is: the fringe of trees and bushes along the north side of the cart path (south of the farm) has not been burned. The woods on the south of the trail show plainly that the forest was on fire and burned extensively to the south of the trail. The significance of this was at once apparent.

The gatepost upon which the tin can target is said to have been placed, is burned to a short butt, and the opposite post is also badly burned, but the surrounding bushes and trees are untouched.

It looked decidedly as though each building was set on fire separately and the hen houses overlooked. Were the buildings standing today, no jury would believe that army men went into that place for target practice.

A second installment of this amazing fact narrative will appear in an early issue of THE DEARBORN INDEPENDENT.

Back Through the Centuries to Days of Sumer

Concluded from page 7

many kings were known, but it was impossible to place them as to time. The same was true of some dynasties.

The first discovery of world-wide scientific importance by Dr. Legrain was of a tablet filling in all the gaps back to 3000 B. C. That was in effect a contemporary record of those days in Babylonia. It was drawn up at or about the time of King Hammurabi, who ruled during the time of Abraham, about 2000 B. C. It gave the names of all the kings and all the dynasties back for a thousand years. There the tablet was broken.

The search for the other fragments of it was interrupted when Dr. Legrain returned for further war service. He was assigned to the difficult task of relocating French farms. As everyone knows who has read anything of history, the farms of France were broken up into extremely small parcels of land under the Napoleonic Code, designed to keep the land in the hands of the peasants. French farmers sometimes have two or three different plots a mile or two apart. Often the shapes of these plots are irregular.

In the regions devastated by four years of high explosive every landmark apparent to the ordinary observer has been obliterated.

"It looked difficult," said Dr. Legrain, "but only to those who did not know the French peasant. There was really little for me to do. I had only to find the original owner of one farm in a given district. Nine times out of ten he could show me exactly where his land lay. To the ordinary observer the surface would be completely changed. But after the peasant had tramped over the general location of his plot for a little while he would come to some sign that meant nothing to anybody else. That gave him his bearings. After that it was merely a matter of pacing off the extent of his property. And, of course, the peasant knew the owners of all surrounding farms, and once one was located the rest was easy."

On his return to the United States the scholar resumed his search. A few months ago he published the translation of another fragment of clay tablet adding more names to the list of kings, and also the names of additional dynasties. And within 30 days of that publication he had found another fragment of a chronological tablet giving the place of each dynasty all the way back to the Flood. It should be stated here that modern scientists do not accept the figures of the early Babylonian historians, who often attributed a reign of 18,000 years to one king.

According to the Babylonian belief, handed down to history heretofore through Greek writers, the world was created about 432,000 years B. C. The Flood occurred in 32,000 B. C. The Babylonians believed that their kingdom had existed for that length of time, of course, under various conquerors. Their historians made up chronological lists, obviously handed down by earlier writers, giving the name of each dynasty and the name of each king. It was these lists that Dr. Legrain transcribed. He located in all eight dynasties never before heard of by modern archeologists. Here and there the name of a king was missing, but the tablets gave the length of nearly all the individual reigns, and also the total for each dynasty. By assuming that when the Babylonian historian said year he meant month, it is possible to account for the extraordinarily long reigns. And that method of computation brings the chronology back to beyond 5,000 years before Christ.

That Billion of Gold—Who Owns It?

Concluded from page 10

As shown in my last article, the $3,165,000,000 gold in the country on June 30, 1919, was counted as being all American owned, although an official investigation by the Department of Labor showed that alien laborers had some $4,000,000 in credits here at that time. It was also shown that foreign banks had credits here in 1919 for $6,357,000,000. So that, including alien hoards, the total foreign credits here amounted to $10,357,000,000.

But the financial officers of the government—the Secretary of the Treasury, the Controller of the Currency, and the Director of the Mint—do not seem to have had the slightest knowledge of this huge lien on our money supply. Not a word is said about the matter in their annual reports. Hence we should not be surprised when they take no notice of the movements of Reparations gold and count every dollar of specie and paper money as belonging to American citizens.

The experience of the New Haven Railroad with its French bondholders must have given a severe jolt to those who think we are a great creditor nation. *Last February officers of the road appealed to the French holders of its $27,000,000 loan for an extension of time, offering an advance in the rate of interest from four per cent to seven per cent.*

But the offer was refused.

Then the officers tried to borrow the necessary amount of New York bankers but here again they were met with a rebuff.

Next an application was made to the government and this, too, was turned down.

The explanation of this matter, as given out by several financial writers, was that the French holders of the bonds were in need of funds and were unwilling to grant an extension of time even with the higher interest rates.

But this does not explain why a great American railroad was unable to borrow money from banks that were fairly glutted with (alleged) American-owned gold!

The most likely explanation of the matter is that the gold was foreign owned and was needed to meet foreign requirements. There was no real American money to spare for the New Haven loan.

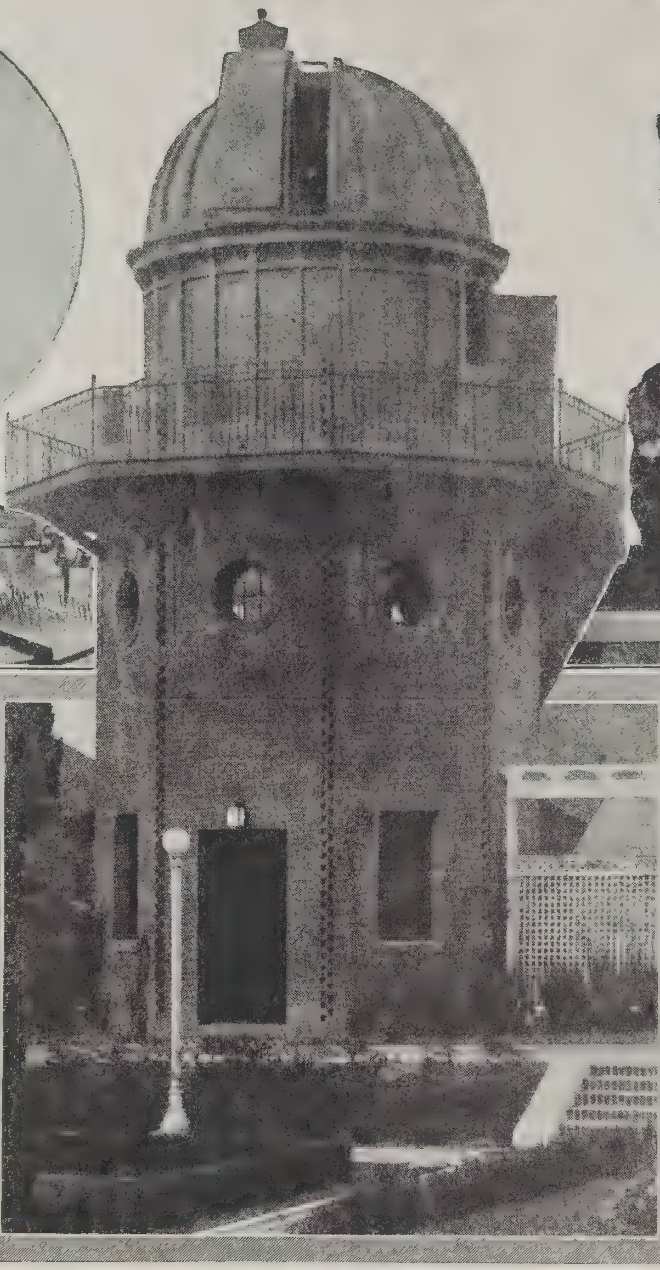
Finally, it would not alter the case to admit that perhaps some of the gold, say 10 per cent, came to make Reparations payments or to pay the interest on the British debt. If, for example, $100,000,000 of the metal came for these purposes in the calendar year 1921, the other $600,000,000 ought to have produced a good effect on the money market and general business. But, instead, we find money scarce and dear, a widespread depression in trade and industry, and an enormous increase of failure and bankruptcies with larger liabilities. *If this gold really belonged here, if it came in settlement of commercial debts as was claimed, these conditions of money, trade and industry would be an economic impossibility. There is no getting around that simple fact.*

There is no instance in the history of any country where such conditions followed an abnormal increase of its metallic currency.

Will the leaders in "this campaign of education against printing press theories of money" kindly offer their solution of that great mystery?

To Tell the People of Our Heavens' Wonders

Dr. Baumgardt at work in his laboratory making a large plaster model of the moon.



The Clark Observatory.

One of the largest meteorites west of Chicago. It weighs 357 pounds. Miss Boeckmann is pictured.

Maps Worked Out by Curator Afford Splendid Presentation of Phenomena of Other Worlds

Observatory Is Erected and Maintained to Give Instruction to Interested Lay Folk

By HENRIETTE BOECKMANN

NOT perched upon some far mountain height to which a pilgrimage means many laborious hours, but nestling in a garden a half hour's ride from the heart of Los Angeles, inclosed within red-brick walls, is a 60-foot observation tower, placed by William A. Clark, Jr., son of the former United States Senator. The tower was erected expressly to interest and educate the general public in the vast, star-flecked cupola that forms our night-heavens. With Dr. Mars F. Baumgardt as curator this unique institution has established a record in permitting the entrance weekly of thousands of persons to partake of the privileges set before them through the public spiritedness of Mr. Clark.

"They are too busy at the great observatories to bother with the public," says Dr. Baumgardt of the professional astronomers. "It is Mr. Clark's intention, as well as my own, to let the public know a little about astronomy without being bored by reading a great many books."

An enchanting feature under the dome of this tower—a dome made entirely of copper—is the display of star maps, an invention of Dr. Baumgardt.

In interviewing the doctor, we stood on the little iron balcony that extends around the tower at the third-floor level. Presently he stepped inside and then, reappearing, handed me a map on which the identical stars, seen off there in the arching night sky, seemed to twinkle and twinkle, only on a miniature scale. It was a black map on which twinkled the stars and glowed the Milky Way.

The key to the wonder of these maps is radium. For years Dr. Baumgardt had sought a suitable way to make illuminated maps, maps whereby the location of the stars might be studied at hand. There came to him the thought of using radium, and it is this which has brought the young curator fame in no small way.

To make his stars, the doctor used radium bromide mixed with zinc sulphide according to the degree of brilliancy of the star to be depicted. This powder is sprinkled on sheet celluloid which has been painted with ether. The sprinkling is done in spots to minimize the waste of radium. Punches similar to those used by street-car conductors are employed in punching the various sized disks required to represent the stars.

Thirty-three star maps have been made by the curator; there are to be 155 when the entire lot is completed. Most of the maps are of a small size, convenient to handle, but Dr. Baumgardt has made one map with dimensions of three or more feet each way. These maps are loaned to schools for study when such request is made.

Another invention of the young curator's is a plaster-of-Paris model of the moon on which he is working in his laboratory. By projecting lantern slides of the moon upon this globe with a stereopticon, absolute accuracy is obtained. Then begins the task of cutting out the contour of the moon by means of dental drills. There are many hundreds of craters, mountains and valleys. When this model is completed, the geographical details of the moon may be seen by the aid of a powerful electric light exactly as they would be viewed upon looking at the original through a telescope. Dr. Baumgardt expects to continue this work of moon-making, restricting the areas of the moon reproduced. These lunar landscapes will then be mounted in exhibition chambers down a hall and placed in proper setting.

The average spectator would have no idea of the labor and material expended on erecting this little observatory. There are three floors and a vault chamber, with each floor given over to astronomical displays.

The first floor of the observatory displays photographs of various phenomena, such as the solar eclipse, sun spots, star clusters, meteors, and so on. The largest meteorite west of Chicago is also found here. It weighs 357 pounds and was discovered near Cañon Diablo in Arizona of which place Dr. Joseph A. Munk, collector of the Library of Arizoniana, the largest collection of books relating to Arizona in the world and now lodged in the Southwest Museum at Los Angeles, has written at length in his book, "Sketches of Arizona." Because of the tremendous velocity with which meteorites enter the earth's atmosphere—the average rate is from 10 to 40 miles a second—only one in many millions ever reaches earth. They are consumed by friction with the air when whirling along at such fearful velocity.

In an underground room in the observatory are numerous photographic transparencies of astronomical subjects. Another of Dr. Baumgardt's innovations is the illumination of these photographic transparencies with a bluish or reddish light, as it may be, thereby giving the natural appearance as seen through a telescope. Some of the country's most notable astronomers, who have visited this unique institution, have been very much pleased with this display. The pictures show the nebulae, star clusters, comets and great spiral systems—probably island universes. Dr. Baumgardt believes positively in the theory of distant island universes.

Lately some very extraordinary photographs made at Mt. Wilson, and not yet shown elsewhere, have been on exhibition at the Clark Museum. Altogether 500 photographs and 1,100 lantern slides, all relating to astronomical subjects, belong to the Clark Observatory. Many slides were made at this observatory; here, also, are the best works in slides from all the great observatories of the country.

One portion of this vault chamber is reserved for a cell containing a radium display. Most of the radium is procured in Colorado and Utah.

On the second floor of the tower, the diameter of the dome, which is 12 feet 5 inches, is used as the standard, and represents the sun. Suspended in the open square formed in the center of the room by the four steel girders supporting the telescope on the floor above are the eight planets, all made to scale with the circle of steel about the room which represents the sun. The models have been painted by Dr. Baumgardt in exactly the way they appear upon looking through a telescope. On the platform beneath the planets is a planetarium. This is an interesting feature, for with the tiny planet models made to scale, their position about the sun is shown during each succeeding week.

On this floor is a mechanism which shows the model of the moon, sun and earth in their revolutions about each other; a superbly accurate machine is this contrivance.

An iron stairway leads up to the floor under the dome where the six-inch refracting telescope is mounted and equipped with every facility for astronomical observation and discovery. In fact, many of the most important astronomical discoveries in the past have been made by a telescope of this size. It is held aloft upon a structural steel foundation embedded many feet below the ground in a concrete block 12 feet square. Nothing more than a bit of felt padding comes in contact with this supporting structure of the telescope, thereby eliminating all vibration, although the street car runs not more than 200 feet away.

The other equipment found at the Clark Observatory includes: four portable telescopes, one eight-inch reflector, one five and one-half-inch refractor, two four-inch refractors, a two-inch twin objective glass, three prism binocular field glasses ranging from three to twelve power, a periscope, three stereopticons and a motion picture machine. One item of interest is a reel of 1,800 feet of film which depicts the construction, transportation and operation of the equipment of the Mount Wilson Observatory located on Mt. Wilson in Southern California and which is one of the two largest observatories in the world. Twenty-five mechanical slides portray the change and cause of tides, the eclipses of the sun and moon, comets moving about the sun, and so on. A library of more than 100 astronomical books of recent publication, and 300 magazines, pamphlets and other printed matter dealing with astronomy, form a part of the observatory's equipment.

This photograph was made on the second floor of the observatory. Suspended are models of the eight planets made to scale; on the platform beneath is a planetarium. Photographs of views taken on the moon are also displayed.

The little ball dangling from the string represents the earth; to the right is a model of Jupiter; to the left, a model of Saturn. Dr. Baumgardt, curator of the observatory, in the photograph.

1922—A Year of Unfinished Business

Concluded from page 8

schools and colleges of the United States is due in a large measure to our release and forgiveness of the Boxer indemnity and it is understood that some of the young men now imbibing education and democratic aspirations in the United States owe their opportunity to funds which otherwise would have been appropriated in payment of that penalty.

As an aspirant to a place among the powers of Europe, Italy is beset by many obstacles. Approximately as populous as France her area is much smaller and much less adapted to agriculture. Without minerals or coal she could not hope to become a great manufacturing nation despite the known tendency of her people toward skillful handicraft.

Socialism, always a factor in Italian politics, took a syndicalistic turn, the workers agitating the taking over of the management and ownership of industries on a basis similar to the so-called Plumb plan suggested for the railroads of this country.

Then a secret society came forward to act as strike breaker in industrial conflicts which the government had been unable to suppress; organized and disciplined members of this order occupied a number of Italian municipalities and forcibly removed their socialist officials, when the members of this order carried arms which, when opposed, they did not scruple to use.

This society—the Fascisti—was composed originally of young soldiers returned from the war and younger men who had been too youthful for that service.

On October 27 the Facta ministry resigned and the following day King Victor rejected the proposition to declare martial law and risk a possible mutiny in the army. The king met and welcomed the black-shirted hosts and on October 30 intrusted to Benito Mussolini the formation of a new ministry.

The economic stabilization of Europe has for some years been the desire and the hope of the world. Closely interwoven with German reparations it has been dependent, European statesmen maintain, upon the cooperation of the United States. It was anticipated that a world's economic conference might attain the end. While the Washington Conference was in session the Allied premiers met at Cannes again, as on previous occasions, seeking to obviate armed intervention in Germany. The United States had been asked to take the lead but President Harding definitely declined to do so. Three days later, January 6, England and Italy issued the call for such a conference at Genoa in March.

The sudden resignation of Premier Briand disrupted French plans and she insisted upon a postponement till April. On March 8 the United States formally declined to participate, but the meeting convened April 10. Russia and Germany sent delegates and before the main conference was well under way it was discovered that Germany and Russia had entered into a treaty mutually canceling all claims for damages due to the war and renewing diplomatic and commercial relations.

As France maintained that the matter of German reparations had been definitely and finally fixed by the Treaty of Versailles and the Reparations Commission which it created, this subject could not be discussed, but some adjustment of affairs with Russia looking toward the assumption by the Soviet government of the debts incurred under the Czar was undertaken. The Russian delegates responded that against these must be accounted the damages which Russia suffered through the invasions of Denekine, Kolchak and Wrangel with Allied encouragement and support. And as Germany would not barter her new agreement with Russia for a seat at the council table she was barred from sessions at which Russian affairs were discussed. Pope Pius XI urged the conference to proceed more in the spirit of mutual conciliation but after a month of idle talk the conference adjourned to meet at The Hague in June and renew its efforts to adjust matters with Russia.

The Hague conference met June 20 and wasted another month, so that the economic restoration of Europe in general and the collection of debts from Russia in particular must pass as unfinished business over to 1923, if, indeed, they can be brought about or be put in the course of adjustment then.

The crisis in the Near East is still in the acute stage. A Turkey believed to be banished forever from Europe returns triumphant, demanding her old homestead, and the powers of Europe seemingly find themselves both unwilling and unable to deny her the same boundaries in Thrace she held before the World War.

What safeguards can be erected, what guaranties demanded, news from the Lausanne conference gives little information. This conference may or it may not solve the problem, but it is certain that the Turkish question, with all its menace for the present and the future, will go over with other unfinished business.

But Europe and Asia have not furnished all the world's unfinished business. Congress enacted a tariff bill but it didn't settle the tariff issue.

The soldiers' bonus did not die when President Harding vetoed the bill. It also will claim its share of congressional attention in 1923.

As this is written the House has passed the ship subsidy measure and it is pending in the Senate. It may be enacted into law or it, too, may go over. In either case the operation of the law will not put a ship to sea in 1922 and subsequent months will determine its wisdom if it is enacted.

The final disposition of Muscle Shoals remains undetermined.

Two big strikes disrupted progress in 1922. Both walkouts of shopmen and miners were settled by truce.

Peace in the coal industry depends on no such uncertain contingencies. Its termination is definitely provided for. On or before these dates new wage scales agreements are to be negotiated. Unless the national coal commission now investigating the coal industry can shed such enlightenment upon it as will compose the long standing misunderstandings of miners and operators, and do so before next April, a coal conflict left over from 1922 may recur in 1923.

Shipstead, in Whom Farmers Believe

Concluded from page 2

"I entered the campaign at the request of progressives, regardless of party, who felt that there should be an entirely new deal in both our home and foreign affairs.

"American diplomacy and foreign policy must be absolutely divorced from high financial influences. We must not allow ourselves to be used as a club for suppressing small nations.

"The transportation and coal questions are at present two of the most vital ones that confront our people. I believe that the power of monopoly which gives owners and operators of these branches of industry the power to inflict hunger and suffering on the citizens should be taken away from them for the protection of the whole people.

"When the Federal Reserve Banking Act was passed, we were told that it would prevent panics and hard times, due to a scarcity of money. In practice it has proved a very clever device for giving a few men control of the people's money and credit. These men have used this law to bring about the very conditions that we were told the law would prevent.

"This was accomplished by encouraging inflation through liberal extension of credit by increasing the supply of money in circulation and by issuing large amounts of Federal Reserve notes, during the years 1918 and 1919. People were encouraged to extend their credit. Then what happened? In 1920 these loans were called on desperately short notice. Credit was shut off and the worst business depression in the nation's history was precipitated. This was done at a time when the Federal Reserve System had, according to the *Wall Street Journal,* a credit expansion power of $20,000,000,000.

"The power controlling the money and credits of the people holds the economic life of our citizens in the hollow of its hand, and the Federal Reserve Board holds that power. They determine where money and credits shall go, whether to agriculture, mining, manufacturing or speculation.

"I charge the Federal Government with the responsibility for seeing that the Federal Reserve System shall not repeat that shameful act this year, nor next year and that a fair share will be fixed for the farmer.

"The Esch-Cummins transportation act gave the railroads the power to raise rates 20 per cent and *freight rates 35 to 40 per cent,* by permitting the railroad companies' own valuation of $20,000,000,000 to be used as a basis of rate making. *This law legalizes $8,000,000,000 of watered stock!* The Esch-Cummins railway act and high financiers' deflation of agriculture and business has intensified the struggle for existence. As a consequence more women are forced to leave their homes to enter industrial employment, and thus compete with men for work. The mothers of our future generations must be liberated from this necessity by compelling industry to pay a living wage to the husband, or breadwinner of the family. We must safeguard the American home. If we fail in this the nation is lost.

"I am opposed to the ship subsidy and the abuse of the injunction power in courts in labor disputes. I am most positively opposed to the Fordney-McCumber tariff law, which claims to establish the highest tariff on record. Such a law serves only to make the trusts and monopolies richer and the people poorer.

"Our commercial and political life has divided the people into various groups or blocs. And whether we like it or not some of these political groups have existed and functioned for many years. For any candidate to say that he will represent all the people, if elected, is mere buncombe. Some of these groups are already well represented in the Senate by the Standard Oil bloc, the mine owners' bloc, the steel trust bloc, the railroad bloc and the financial bloc.

"I shall not seek, when I take my seat next March, membership in any of these blocs. But with such progressives as Borah, La Follette, Frazier, Brookhart and others, it shall be my endeavor to participate in the work of the farmers' bloc, the labor bloc, the legitimate business man's bloc, the soldier's bloc and the mother's bloc.

"We cannot blame any particular party for the present deplorable condition of the country. The Federal Reserve Banking Board is composed of both Republicans and Democrats. Democrats and Republicans alike voted for the Esch-Cummins bill and a Democratic President signed it.

"But both of the old parties are playing rotten politics. Both will be cleaned up from within or the people will sweep them out of existence. The day of reckoning is not far off and it will be an awful smash. The probability is that the men in power in governmental matters, at present, will not take heed soon enough, or it is not in them to change their spots, to ward off the wrath of the people that will destroy them completely."

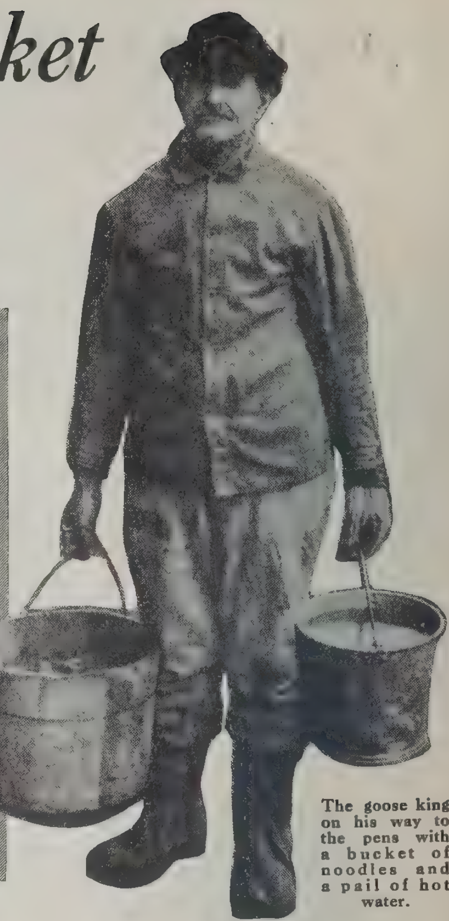
With every newspaper in Minneapolis and St. Paul fighting him desperately, except one struggling labor paper of Minneapolis, Dr. Shipstead received a plurality of 5,000 in the former and 10,000 in the latter, or rather in the counties in which these cities are located.

With the exception of some of the small country weeklies, the newspapers throughout the state were nearly all against him. But practically every small banker of the state, the farmers, the laborers and railroad men were for him. Usually a strong Republican state, the elements named, for the most part, deserted the Republican party, joining the Democratic progressives, who also deserted their party, to vote the third party, or Farmer-Labor ticket.

The Nation's Greatest Goose Market

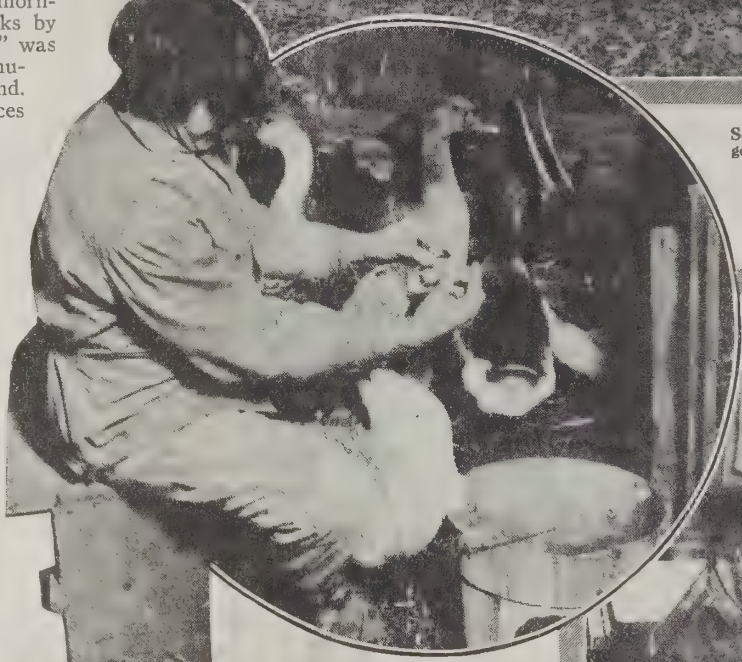
Farms of Watertown, Wisconsin, Supply World's Holiday Tables With Stuffed Fowl

By FRED L. HOLMES



The goose king on his way to the pens with a bucket of noodles and a pail of hot water.

Several members of the goose flock on their way to the feeding sheds.



Fred Albrecht, goose king at Watertown, feeding a bird.

The noodles are cooked in wash boilers and drained by the boiler sieve.

GOOSE farms of Watertown, Wisconsin, supply the world's holiday table. Wherever one travels, South or East, during the winter, the eye catches the sign: "Watertown Stuffed Geese." Railway dining cars and large hotels carry simliar notices.

Out of Watertown, a thriving city of 10,000, once the home of Carl Schurz, soldier, orator and cabinet official, and other noted forty-eighters from Germany, there is a countryside where thrives an industry, the like of it to be found nowhere in the United States. The rolling prairies of Dodge and Jefferson counties with their big red barns, and pastures of Holstein cattle, still continue one of the oldest and most curious of vocations—the stuffing of geese. The farmers of this industrious community, rich in dairy products, have developed it to such an extent that the neighborhood has become the greatest single goose market in the world.

There was a time, 50 years ago, when the "goose girl" who went forth in the morning and evening, assembling her flocks by the calls of "woodie, woodie, woodie," was as symbolic of the life of the community as the milk maiden of Holland. That day is gone. Woven wire fences now restrain the goose flocks, and a new conception of the work of women has taken many to the cities. The farmer and the housewife who remain. still use the same old call notes, and the industry has gone forward, in spite of the retirement of the "goose girl."

Watertown geese develop the largest livers of any geese brought into market. That is why Watertown heads the industry. To produce a goose of 30 pounds, with a liver weighing four pounds, is, to these farmers, an achievement as great as the raising of a cow to become one of the world's greatest milkers.

Geese are developed to this enormous size, with large livers, by forced feeding. The raisers call it "noodling," because a pasty mixture, rolled in the form of noodles, is forced down the fowl's throat every four hours to hasten the fattening process.

A century and a half ago, this strange method of forced feeding of geese had its origin in Alsace to satisfy the appetite of a sovereign.

Two methods are used by the Watertown farmers in raising geese. Stall-fed geese are placed in pens; given grain and water and allowed to eat as they desire. About 500.000 pounds of this class are sold from the locality. The firmness of their flesh makes them a desirable bird for food.

Stuffed geese are forcibly fed, and compelled to eat a certain menu. About three-quarters of a century ago, there was an exodus of Germans from the Fatherland. The first leaders came imbued with a love of liberty. With them they brought their Old-World customs, habits and industries, including the custom of raising and "stuffing" geese. About 100,000 pounds of "stuffed" geese are shipped from Watertown annually.

The goose industry is highly specialized. Early in the spring the largest eggs are selected and placed under hens for incubation. From four to five eggs are used in a setting. It has been found that a hen is more attentive to her nest; that she will leave it only for a few moments each day and that she is not given to excursions of fighting with her neighbors, as is the custom among geese. When the eggs are hatched this foster mother is as solicitous for the flock as she would be of chicks.

Three breeds of geese are raised—Toulouse, Emden and African. The Toulouse and African both have slate-colored backs and white bodies. The Emden is pure white. The African differs from the Toulouse in having a black bill.

Most of the goslings are hatched in April, or early May. Clean quarters are provided, and a pond in which to swim. The fastidious old hen spends much of her time scolding her strange children, who take to the water and dive and puddle around the pond for their food. Three or four weeks later, the hen refuses to mother them longer.

The making of the noodles for the fattening process is the key. The flour of three grains, barley, rye and wheat, is mixed into a paste that looks like putty. By using an old sausage stuffer, this pasty substance is molded into strings about the size of small wienerwursts, an inch in diameter and four inches in length. The noodles are cooked in a wash boiler, drained by a boiler sieve, cooled by immersion in cold water to prevent crumbling, and then put into a cold place until ready for use.

All is now ready for the feeding. With a bucket of noodles and a pail of hot water, the farmer goes to the stalls. Sitting on a box, he takes a goose between his legs and after dipping the noodle into the hot water, holds the goose's head in one hand and with the other introduces the noodle into the fowl's mouth and gently pushes it down. During the first few days, three noodles are fed every four hours. Some member of the family has to be awakened at night to attend to the feeding. Two or three weeks later a goose will be able to eat from 30 to 36 noodles a day. One man can stuff 35 geese an hour.

Feeding of noodles to the geese makes them thirsty and gallons of water are drunk by them; a 25-pound goose drinks two gallons daily. It requires from three weeks to 25 days before the "stuffed" bird is ready for killing. After the second week, the geese are too heavy to walk and sit near the drinking trough until the next feeding.

The dressing of the "stuffed geese" for market requires a skill equal to that employed in the feeding. The feathers cannot be removed from the tender skin either by picking the feathers dry or removing them by scalding. The birds are placed in cloths above a steaming boiler and kept there until the feathers come off without abrasing the skin. The bodies are singed over by an alcohol flame and then hung up in a cool place until the following morning, when they are packed for shipment.

Because of the value of the liver for the making of *pate de foie gras,* or goose-liver pie, these are often removed and placed in sealed glass jars for shipment. These livers are a pale red due to the fattening. The skin is often used as a delicacy by being browned.

Most of these "stuffed" birds weigh from 25 to 35 pounds each when prepared for market. Some of the geese are sold by a method that has been in vogue for a quarter of a century. Before the war, a goose weighing 25 pounds would bring 25 cents a pound; for every pound above that, the dealer would pay an extra cent, so that a 35-pound bird would bring $12.25. These price scales have been greatly changed since the war. Dealers are offering this year from 20 to 30 cents a pound above average weight. A 30-pound goose will now bring a farmer from $16.50 to $18. Long before the time for stuffing the birds comes, the agents are in the field making offers and the goose flocks are usually sold months before they are brought to market. An over-supply of geese at the Watertown market has never been known.

Unique among the leaders in the goose-raising industry of Watertown is Fred Albrecht, who has made goose feeding the chief part of his farm work for 30 years. Among the other farmers who stuff geese, Mr. Albrecht is "king." Owner of a modern farm with large barns, automatic milking machines, and prize Holstein cattle, he nevertheless likes to raise geese. Not alone for the profit does Mr. Albrecht continue this work amid all the modern conveniences on his farm, but because he "likes to work with the birds."

On his farm, the geese come to his call of "woodie, woodie, woodie" as quickly as a dog obeys his master. They are anxious to be fondled. He will take them under his arm, and there is no struggling to be released from his grasp.

"People do not often realize the great benefits conferred on mankind by geese," said Mr. Albrecht. "If a list of the benefactors of mankind were compiled the goose would be in high rank. There is hardly a part of the bird but has served some useful purpose."

There is a great deal of homely philosophy about geese from the lips of this king of the goose raisers of America. He points out that for centuries, the quill of the goose was used as a pen and the fate of many a nation has been sealed with a few strokes of the quill. Nor does he forget the legend that cackling of the geese saved Rome.

Two weeks before the Christmas season, the quiet city of Watertown takes on the bustle of a busy market place. The packing of the geese for shipment to the eastern cities requires considerable time. Every effort is made to place the shipments in cartons that will insure transit without damage.

It is during this season of the year that the talk on the market turns to "geese," just as the visitor at New Orleans during the same season must listen for hours to long discussions of the habits and succulency of oysters.

In spite of all the allurements of modern farming which have come upon the community, the goose farms have not been abandoned, but there has been a steady increase in the size of the flocks, due to the increasing demands. Watertown prides itself on being the largest goose market in the world.

Veteransville—A Community of Silver Stars

Minnesota Project in Which Rehabilitation Is Self-starting

By GRACE E. POLK

ITS name is Veteransville, and there is no other town in the United States exactly like it. It is made up of 31 veterans of the World War, and every one is a silver-star man. Veteransville is Minnesota's answer to one of the problems of rehabilitation. Just at present the town site looks very much like any other cut-over land in Northern Minnesota, but if the hopes and plans of its founders materialize, in half a dozen years, it will be one of the busiest little co-operative towns in America. The idea is unique and was conceived by D. D. Mayne, head of the University of Minnesota Farm school, and worked out jointly by him and the Veterans' Bureau of the Tenth District. They planned, but it remained for "the boys" themselves to put it across. If the energy and the co-operation hold out—and the 31 say they will—Veteransville will become a model for many such ventures in the United States.

All the men of Veteransville are rehabilitation men, and are being educated by the government in farming. This education includes a three-year course at the Minnesota University Farm school with summers spent in practical demonstration on farms of the state under the supervision of government and farm-school experts. With several hundred former soldiers expecting at the end of their three years' course to make a living from the soil, Mr. Mayne, who has long been interested in trade schools and co-operative projects for rural districts, believed that some plan could be evolved whereby these men could buy their own land, work it during the summer months, and so have something to show for their efforts when they finished their education, instead of merely having put in their summers on land of others. As few of the soldier students have any means except their government pensions, and not many are capable of doing regularly the heaviest farm work, the project required, first of all, co-operation for its successful conduct.

Nobody on "sick call" at this formation of veterans.

The first plan suggested was the joint purchase of a large tract of land to be worked co-operatively and owned by an association, but to this plan the Veterans' Bureau refused its sanction, as impractical. The present plan was then evolved by which an option was to be secured on a large tract of land, the land divided into smaller tracts, according to its best uses, and each man given an opportunity to buy a tract on small payment down and "long time." There were to be no unnecessary restrictions, no picking of men for the project: any soldier student, who should be adjudged physically fit for farm work, was to be allowed to come into the association and share in the purchase of land. Though so entirely democratic in principle, the scheme, in its working out, did actually result in the association getting the pick of the rehabilitation men, for only those who were taking farming seriously and who were willing to assume responsibilities to succeed, cared to enter the association.

This plan for organization was O. K'd by the government, and on these lines an association was formed and three of its members sent out to look up a suitable tract. The tract settled on lies 15 miles east of Mille Lac Lake, second largest in size in Minnesota, in the center of Eastern Minnesota and midway between Duluth and the Twin Cities. The district was once heavily wooded with white pine and 25 years ago was the center of vast lumbering projects. The tract as originally chosen included 4,500 acres, and would have cared for a much larger colony than the present one but nearly two-thirds of the land was thrown out after inspection by the Veterans' Bureau on account of swamp, stone or other defects. The remaining 1,580 acres has already been taken up, either by actual purchase or by option, by the 31 men now at Veteransville, so that the colony can be enlarged only by obtaining neighboring tracts. Several of the men have taken 40-acre tracts with an option on an adjoining 40, for which the rules of the association provide. The land was obtained for slightly less than $25 an acre, and the men have five years in which to pay for it, so that with their average pensions of $100 a month, they should have no trouble in doing so.

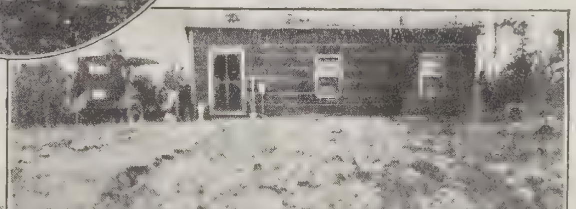
On a central 40 of the tract is an old lumber camp, with a dozen or more log buildings still standing. Twenty-five years ago they were used as headquarters for 3,000 men who logged in this region. Fire has been through the country several times since then, and two years ago it swept out of existence the 26 settlers' houses which formed the town of White Pine. A clearing about the old camp buildings and about the one-room schoolhouse saved them from the flames, and these buildings form the community center of the new town of Veteransville. This central 40 has been reserved, and option secured on it, and as soon as the association has been incorporated, it is planned to buy this 40 for the town site. Such, in brief, is the plan for the building of the silver-star town of Veteransville, and here is how the plan has worked out so far.

On May 1, the men arrived on the location. Some of them had already picked out their farms and had their projects passed on by the government. The rest were ready to do so as fast as they could. Eight of the men are married, and their wives either came with them or joined them soon afterward: several others are planning to get married within a short time.

When they arrived the land was rather a desolate looking place. Snow still covered it in patches: snags of pine trees, blackened by the fires, stuck out everywhere: the old buildings were what old lumber camp buildings always are, dirty—and worse: water from the Snake River covered all the land adjoining the future town site.

But the men came armed with enthusiasm and picric acid. In an undertaking of this sort, one is about as necessary as the other. On the second day after their arrival, they blew out the dam, which the old logging company had built, and by a few hours work reclaimed many acres of good pasture land along the river front. The unmarried men took over the main bunk house for their sleeping quarters, and the married men divided up the smaller shacks, settling two families to a shack, where feasible. The lumber company from whom the land was bought contracted to continue the "company store," and also to board the former soldiers, with a few of their own men still remaining, until January 1, 1923, at $16 a month. These arrangements have solved the living problem for the present, and given the men all their time to put in on their land.

"Fatigue" duty which none dodges.



The first arrival at Veteransville.

Co-operation squads of four work alternately clearing each other's land.

Co-operative farming colonies usually fail. The ideal seems good, but human frailties intervene to its destruction. Ever since the establishment of Brook Farm, groups of people in America have been banding together to do, in various ways, much the same thing that these 31 wounded soldiers of the war are doing. Two things have made Veteransville successful so far, and it is these two things, if anything, that will carry it forward to permanent success.

The first thing is that these men, with from one to three years' training in the University Farm school, are taking with them into this north country knowledge of the best ways in which to do their work and the spirit of scientific investigation which will lead them to try out their land for its best crops and its best method of cultivation. As an example of the latter, one of them has already, with a great sense of fun in the game, cleared out little patches here and there on his land and planted them to corn and various sorts of vegetables "just to see what will happen." With charred pine stumps the main impediment to cultivation of their land, the veterans immediately ordered in a carload of picric acid and began the "blowing-out" process.

The majority of the veterans have been on their land now for a little less than two months and they have an average clearage of three acres. Clearing in this case does not mean that the land is ready for the plow and crops, but that the stumps are out and the first grubbing done. The ordinary "jackpine farmer" in this neighborhood, grubbing out laboriously by hand, gets an acre a year cleared and is soon too discouraged to keep it up. Old settlers look with amazement on what has been done by these "boys" in a few brief weeks. Men from the Farm school and the Veterans' Bureau have kept in close touch with the work as it progressed, and helped with their kindly advice and suggestion. J. J. Dahlberg, of the bureau, has been detailed to remain at Veteransville a part of each month throughout the autumn and summer, and M. J. Thompson, of the Northeast Experiment Station, is a frequent visitor. E. O. Buhler, who sold the land to the men, has also taken more than a real estate dealer's interest in forwarding their welfare.

But the real thing that is making Veteransville a success is the spirit of co-operation. It's the old wartime spirit that men who fought in the trenches of France know so well. These men come out of fighting divisions. They have learned, not to forget, what it is to be near death, to be in pain, and yet to be courageous and helpful. Three of the 31 men lived through to tell the story, first-hand, of the famous "Lost Battalion": their big president, Knute Lothberg, went through every engagement in which the Fourth Division took part, from its organization until it was disbanded. Another man fought with the British tank corps and was wounded every time he went into action. No wonder every man is every other man's buddy and ready to help him in time of need. They take pride in what the others have accomplished. With the boyishness that characterized the men of the American Army, they even take pride in each other's wounds. "Now, you wouldn't think it to see him," said one man, "but that guy there's carrying 17 wounds. There wasn't much left of him but wounds when he came off the line."

When there's any work to be done for mutual benefit, they "pitch in" and do it together. They have put a fine hardwood floor into the big bunk house, taken out the old roof supports, which neighborhood wiseacres said couldn't be done, and hung the roof from the walls, and now they have the finest town assembly room and dance hall anywhere in the country. One of the first things they did after getting moved in was to put up the tallest flagpole they could find in the neighborhood. On Memorial Day, the women of the colony made a cross of flowers and Veteransville held the only Memorial Day program the farmers thereabout have seen since they moved in.

Co-operation is organized as well as unorganized. Buying in carload lots has saved them considerable. They hope to have an extension branch of the farm school opener at Veteransville.

"We're all bosses, so we all work," was one man's way of putting it.

BRIEFLY TOLD

Synthetic camphor, made from the turpentine of the pine forests of the South, is expected to remove Japan's control of the supply. The new process does not require elaborate machinery and can be made in plant units, and a by-product, which is the result of this synthetic treatment, has a commercial value almost equal to the cost of the original turpentine.

The Fascisti of Italy forced each landowner to hire a stated number of laborers for every hundred acres of land he owned or operated. This was done to abolish unemployment and increase production.

Premier Bonar Law outlining his anti-Coalition policy during the great parliamentary contest said, "The argument put forward that, in view of the pressure and danger from Labor, it was necessary to keep up even the name of a Coalition when the reality was gone, believe me, is a profound mistake. If we had succeeded in setting up, on the one hand, one party representing everything opposed to Labor, and, on the other, Labor alone, you could have done nothing which would have added more to the force of Labor, and you would have made it certain that, as an alternative government must come, the next government would have been a Labor government."

A 25-year-old ordained minister and his wife have entered grammar school in the seventh grade at Beaumont, Texas. Regular attendance at school was denied them during their childhood because they lived in an isolated district. The theological seminary is his educational goal as he wishes to qualify to minister to larger congregations.

A grub of the wood-boring variety is threatening to destroy many of the ancient architectural wonders of London. Westminster Abbey, the Guildhall and Saint Paul's Cathedral are among the buildings being attacked.

A newly discovered fiber known as "arghan" may take the place of flax and cotton in the manufacture of textiles. It is said to be half as strong again as the best flax and hemp, weaves into fine cloth that bleaches and dyes easily, resists the action of sea water and has unexcelled wearing qualities. It is derived from a plant of the maguey or pineapple type which originally grew only in South America. It is being transplanted to the Malay states, Ceylon and India by manufacturers who plan to bring it to perfection.

Experiments carried out in Seattle have developed a wood briquette that equals anthracite coal in heating value, according to reports. The new fuel is made of sawdust, bark and mill refuse now considered a total waste.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Scientists of Germany have synthesized a new chemical drug of importance in tropical medicine. This new drug, known as "Bayer 205," is antitoxin for sleeping sickness so common in Africa. The government of Germany has been called upon to safeguard this discovery, and not to grant the use of it to other nations except on condition that Germany's lost colonies be restored to her. Although Germany has no African colonies she appreciates the value of pharmacological research.

A skin suture, that leaves no unsightly scars in surgical operations, has been invented. The new suture is called "equistene" and is made by treating silk with chemicals so that the tissue cells cannot penetrate the meshes of the silk.

Ninety-seven per cent of Africa is ruled by the European.

"Lady Jewel," of Woodland, Washington, is the world's champion hen. She has broken all records by laying 335 eggs in one year or 11 times her own weight in eggs.

In Mukden, Manchuria, there is a street car line over which little dilapidated cars, each drawn by three Mongolian ponies, run from the walls of Mukden to the railroad station in the Japanese zone. These same cars were used on the cross-town lines in New York City 30 years ago. When New York discarded them they sold the cars to Tokyo, Japan, and when Tokyo adopted the electric system the cars were sold to a firm in Mukden.

Women were placed on a jury case in the supreme court in Red Deer, Alberta, for the first time in the history of Canada.

President Alvaro Obregon of Mexico travels extensively. He rarely journeys more than a day's ride from the capital but there is never a day of fiesta in any community of importance within that radius that the president doesn't attend. He plans to spend Christmas in his native state, Sonora.

Gray Gables, on Buzzard's Bay, Massachusetts, for years the summer home of Grover Cleveland, is to be cut up into lots and sold on the market.

Easter Island in the South Pacific is virtually devoid of vegetation and without bird life of any kind. Heavy winds prevent birds and trees from existing on the island which is triangular, 12 miles by 9 by 7. Two hundred Polynesians living there suffer perpetually from hunger. There are many high, carved stone images on the island, the origin of which never has been determined.

"Vibrac" steel is a new steel made in Manchester, England, which never tempers brittle and is absolutely reliable in behavior under any ordinary treatment.

Chief White Elk, Indian lecturer and head of the tribes of British Columbia, is on his way to England to present to King George the grievances of the Indians of the Pacific Coast of Canada. He is a Carlisle graduate and accompanied the Prince of Wales on his American tour in 1919. The Indians of British Columbia desire many reforms, chiefly in the direction of facilities for education.

Buildings of the University of Vienna are becoming unfit for use due to neglect and lack of money for repairs. The roof of University Hall has not been repaired since before the war and the rain is coming through, loosening the plaster, cracking the mouldings and staining the fine frescoes with dampness.

More than 700,000 pounds of honey was harvested in British Columbia during 1922.

The first form of an automobile made its appearance in the United States in 1795, according to an advertisement appearing in the *Columbian Sentinel* of Boston, October 14, 1795. It was heralded as the first moving carriage to appear in this country and the admission charge was three shillings.

Contractors who own the site on which London Bridge is built threaten to remove it, offering to set it up again in another place. To which proposition, lovers of old London reply, "A monument is not of masonry alone; it is the masonry plus the site."

A GOOD START FOR 1923

The next issue of THE DEARBORN INDEPENDENT starts the fifth year of its publication under Mr. Ford's ownership. During the past four years it has grown from a small village weekly, with a local circulation, to one of the foremost magazines published, with a world-wide circulation of more than a quarter of a million subscribers. These facts speak for themselves. If you are not already a subscriber to THE DEARBORN INDEPENDENT, join our growing family today and start the New Year right. If you are a subscriber, call our publication to the attention of your friends and neighbors and urge them to subscribe.
Any Ford Dealer will gladly accept subscriptions or they may be mailed direct, using the subscription blank below.

Power of Money and Credit

Of Every $1,000 Cleared by Banks in Year, There Was Just $1.78 in U. S. Money on Hand

CHRONICLER OF THE NEGLECTED TRUTH

Now the Government Must Tax Itself!

With One Hand It Has Extended the Tax Net; With the Other It Has Provided Means of Escape; Now It Must Curb Itself

By AARON HARDY ULM

AT LAST it has come to the point where government in these United States must tax itself!

And in making it possible to do so there must be added—by the mere stroke of a pen—at least a billion dollars of value to the sales worth of mere paper. The paper is beautifully engraved and of very fine texture but, particularly in respect to that added value which is to be given it, is only paper.

And that isn't the only curious phase of the newest realm in the realm of national and general taxation.

Perhaps the most singular one is that virtually all schools of political thought favor it, most of them urging it as absolutely necessary. The extreme radical advocates it no more heartily than does the crabbed reactionary. Even those of that class which presumably is to be most affected by it are for it. Why shouldn't they be? The moment it is adopted it will make them considerably richer, at least potentially.

The proposal is contained in what, if adopted as it probably will be, is known as the Twentieth Amendment to the United States Constitution. The amendment would authorize both the Federal Government and the states to tax public securities, that is, national, state, city, county and all other bonds.

It wouldn't permit any additional taxing of those outstanding now or at the time of the amendment's adoption. In the main they are tax exempt, and to change their status would be a violation of contract. But just as soon as it is fixed in law that all future issues of public securities will be taxed, those outstanding will increase in sales value, say experts, in the amount of five to 10 per cent. This will be because of the enhanced "scarcity" factor in the tax-exempt quality adhering to these securities.

It is that tax-exempt quality which has confounded the best-laid plans of recent years with regard to taxation. It is a rather long story and somewhat involved but one that every citizen should know.

> **TAX-EXEMPT securities are drying up the sources of Federal taxation and they are encouraging unproductive and extravagant expenditures by states and municipalities. There is more than the menace of mounting public debt, there is the dissipation of capital which should be made available to the needs of productive industry . . . . public borrowing . . . . if left unchecked may soon threaten the stability of our institutions.**
> **—President Harding.**

It goes back in a way to the beginning of what is known as public credit, which, as used today, is a quite modern creation. The practice of borrowing on the public credit began, substantially, with the modern banking system, with which it grew up and expanded.

It was held until recent years that for a government to make its own tokens of debt taxable would be a foolish if not a costly procedure, and it rarely was engaged in.

If a government, for example, asked for a loan, say, of a thousand dollars, the interest it would have to pay was believed to depend somewhat on whether it taxed its promise to pay—as it usually did other like obligations, such as land mortgages and industrial securities. If the tax amounted to, say, one per cent, it would have to pay one cent more interest, or such was believed to be the case. Thus before the tax was collected, the government, it seemed, would first have to pay the money in the form of added interest to the borrower, which would be merely a swapping of dollars in which it was thought more would be lost than gained.

Therefore, most of the public securities that have been issued in this country were and are wholly or in the main tax exempt. The Federal Government's bonds always have been wholly exempt from taxation by the states or other auxiliary governmental units. While a large proportion of those now outstanding are subject under certain conditions to Federal income taxes there are, at least for the present, such wide exceptions that one of the best political economists in the country declares that, practically, scarcely any taxes have as yet been paid on any of them.

Congress once attempted to impose a tax on the bonds of states and cities but John Marshall, the famous Chief Justice, held that such was not permitted by the Constitution. In practically all the states bonds issued or authorized by them are tax exempt when held by their own citizens. In a majority, however, bonds of other states held by their citizens are subject to taxation.

For accuracy's sake, it is well to point out that public securities are not exempt from estate or inheritance taxes. This is because those taxes are held to be not on property but on the right to inherit property. These taxes do not amount to a great deal as far as bonds are concerned; nor do the taxes imposed by many states on bonds of other states held by their citizens.

It is probable that the $30,000,000,000 to $40,000,000,000 worth of domestic public bonds now outstanding in or for the various governmental units in this country are exempt in actual practice to at least 90 per cent measure from taxation of all kinds. That is, the holders of fortunes invested exclusively in them scarcely need to know that there is any such thing as a tax collector. They need not worry in the least, as far as their personal interests go, about the wastefulness of legislators or public administrators, unless it goes to the point, which rarely has happened in this country, of causing default in payment of interest or the principal of public debt. They can put their bonds away, and forget business, industry, government—everything. *And there are many such persons in this country now and the number has been greatly increased during recent years.*

The conditions which make their situations possible caused no great concern, to either political economists or reformers, until within the last few years. The problem was brought to focus by the effects resulting from the operations of the Sixteenth Amendment to the Federal Constitution.

That amendment went into effect about 10 years ago. It empowers Congress to "lay and collect taxes on incomes from whatever sources derived . . . ." Some able lawyers say that under that amendment Congress might tax bonds, but others contend that the Supreme Court has nullified the effect of the words "from whatever source derived" in so far as they relate to other than Federal securities.

The prime purpose of the Sixteenth Amendment ostensibly was to reach the tax shirker, to adjust Federal taxation more equitably to the rule of ability to pay. But many students predicted that evil as well as good would result from it. This, even its best friends now admit, has happened, though they claim and no doubt rightly that much good also has come from it.

Evils which even its critics didn't fully anticipate have flown from that amendment.

One is the buttressing in its tax-escaping security of a large part of the very wealth which the amendment was to make bear more fully its proper share of the governmental burden. The effect of that on national economy has gone much further than mere loss in revenues. For it has caused much so-called tax-avoiding wealth to turn "slacker" in an industrial as well as a tax-paying sense.

And the oddity of it is that in both directions it has been aided and abetted by government itself—so much so and so irretrievably that government now sees no way out of the dilemma except to check its extravagant use of it by taking its own credit and thereby itself.

Does the world of imagery present an example of more amusing contradiction, anomaly, and confusion than that?

The proposed Twentieth Amendment will thus be a supplement to the Sixteenth. The sacredness of contract prevents it from correcting any of the existing evils it aims at; it is expected only to curb or prevent them in future.

Those evils are typified by the tremendous increase that has been made in public securities, that is, national, state, county, city, school district and all other kinds of bonds, in the main tax free. In 1913 all those bonds amounted to a face value of only about $5,000,000,000. At that time less than $500,000,000 worth were issued and sold on the average during each year. Today they total somewhere between $30,000,000,000 and $40,000,000,000. In 1921, a year of financial depression, new ones totaling more than $1,300,000,000 were sold by the states, cities, counties and other units outside the Federal Government. Political economists say that unless some way is found for checking this orgy of public debt-making that within a few years the income of the nation will be absorbing annually from $2,000,000,000 to $3,000,000,000 worth of new public securities. And in that, they say, there would be a most direful social and economic threat.

Why this rampage of debt-making? No doubt there are several contributory reasons, such as wild public demand for improvements to be paid for by later generations and the belief of many public officials that the easiest way to make good popularly is to spend money which their successors will have to raise.

But the controlling reason for it is the demand for public securities.

And the underlying reason for the tremendous demand for public securities is the taxes imposed by authority of the aforesaid Sixteenth Amendment—namely, the income and so-called profits taxes.

For those taxes can be escaped, legally and morally and ethically, as ethics generally are interpreted, by taking money out of productive enterprises and putting it into tax-exempt public bonds.

And because of that fact the bonds sell better and possibly at lower rates of interest than otherwise would be the case. Therefore, more of them are issued and sold; and to get money to pay the interest on them the ordinary taxes, which the operation of the Sixteenth Amendment was expected to reduce, have grown at a rate never before known in the history of the country. And where $1,000,000 of wealth escaped all taxes before the amendment was adopted now tens of millions escape all tax burdens. And those who must borrow money to build homes or equip factories have greater difficulty getting it and must pay higher interest rates because the tokens of these kinds of debts are taxable—and those who owe them as a rule must pay the taxes in the form of bonuses or higher interest.

This, let the writer say, is no attack on the income tax in principle or practice. The only aim is to show by undisputed facts the curious results and effects which nearly always flow from even the best intended adventures taken by government along new roads. Undoubtedly many results in this particular case are, as now generally declared, good, possibly in measure sufficient to offset the evil.

But the evil, according to some of our leading political economists, is sufficient to carry a serious threat to the basic institutions of the country.

The evil is inherently destructive even of the good in the process. Although during the last half-dozen years large individual fortunes grew as never before in this country, the income tax books would indicate a phenomenal decline in them. In 1916, 1,296 persons and concerns reported taxable incomes of $300,000 or more. In 1919 there were reported only 679 such incomes. The drop in the total of income reported by that class was from $992.972,986 to $440,011,589. And there have been similar drops in substantial taxable incomes all along the line, both in income reported and actual taxes paid on it.

Did those incomes decrease as a whole in any such degree by reason of the high taxes or otherwise? Not at all. The sources of them were merely shifted to non-taxable avenues, paved with the tax-exempt public security.

The reason for that is illustrated clearly by figures prepared by specialists in the United States Treasury Department. They show that if a man has $1,000,000 to invest it is necessary that he put it into a taxable investment that will earn not less than 10 per cent if he is to get from it a net income equaling the net yield of that sum when put into five per cent non-taxable public bonds. The bigger the investment, the bigger must be the earning if the public bond competition is met.

The Federal Government, now on a fixed scale of operations that makes it necessary to look largely to big incomes for its revenues, is forced out of sheer protection of the revenues to favor a curb like that proposed in the suggested Twentieth Amendment. The adoption of the measure has been urged by both President Harding and Secretary of the Treasury Mellon, who, singularly, have the support of persons belonging to schools of political thought with which those two officials have little sympathy.

Therefore, there was little opposition to it when considered in open hearings by the Ways and Means Committee of the House of Representatives. It has been reported favorably for passage and if acted on by the present Congress it very probably will be passed. If it goes over it will have even better prospects in the new Congress.

What the state legislatures, which will have to ratify it, will do is not so certain. There is reason to believe that the plea of State rights is more of an article than a real ground of opposition. The amendment as now proposed gives to the states equal power to tax Federal as the national government seeks for taxing bonds issued by or on the authority of the states.

The real opposition is based in the theory that some sections can benefit at the expense of other sections.

Most public bond issues in the South, for example, are sold in the East. Under present tax exemptions they can be disposed of at lower interest rates than if they were fully taxable. Authorities say that the difference in interest would amount to one-half to one and one-half per cent. This would have to be paid, say the Southerners to the Eastern purchasers.

There undoubtedly is validity in the contention that the taxing of public securities—though in essence it amounts to taxing public credit—will tend to curb the development of a peculiar class of idle and non-taxpaying "coupon clippers." It also will discourage the issuing of public bonds.

It also will make more secure the tax-raising facilities possessed by Congress and given almost revolutionary enlargement by the income tax amendment. This of itself may or may not be good, depending on whether Congress should have an unlimited field for raising and spending money.

Though it extends Federal power there is scarcely any alternative except abandonment of the income tax.

One affected interest—holders on large scale of outstanding mortgages on the public—will be immediate gainers, through the increased sales value given the bonds already procured by them. That, however, will not be a toll on the taxpaying public, as the increase will be wholly in sales value.

The new tax proposal is approved, not because it is excellent *per se* but because it is the only way by which legislators can correct gigantic evils resulting from things already established.

"Truth Crushed to Earth"

A Second Chapter of the Amazing Story of the Killing of Major A. P. Cronkhite

By CHARLES ALBERT COLLMAN

Harris & Ewing

MAJOR ALEXANDER P. CRONKHITE

WHILE a United States Army officer of high rank—a divisional commander—was leading his country's troops to action on a foreign battlefield, his young son was shot and killed on an army reservation in a western state. The young man was a major in the 213th Engineers, which he was training at the time for service abroad. He was 24 years old, and only three years before had been graduated from West Point. He was regarded by the junior officers and men in the ranks as the ideal commander. He was of an old and distinguished family, whose representatives had served their country in posts of honor for many generations.

The death of this young man was mysterious. It took place on a lonely and unused trail through the woods which he had been persuaded to penetrate. There were but two witnesses, and these swore before a military board of inquiry that he had shot himself by accident. About two and one-half years later, one of these men confessed that it was a shot from his pistol that had killed the major. He at once pleaded guilty to involuntary manslaughter before a United States commissioner. He implicated his fellow witness, and both men were indicted by a Federal grand jury.

But while proceedings were pending for the extradition of the two indicted men in New York City, a powerful racial organization, with fanatical leaders and unlimited resources, intervened, and asserted that one of the men should never be brought to trial. There is evidence to be presented, and there are witnesses to be examined. But this organization promises that the evidence shall never see the light, that the witnesses shall never be heard.

Beclouding the Public Mind

BY EXPENDING great sums of money, and inaugurating a publicity campaign unparalleled in scope, it is trying to becloud the public mind from the true issue, while in the courts its lawyers, with every quibble and loophole known to law, are tying the hands of prosecutors. They assert that, if need be, they shall bury the case for years by appeals to the Supreme Court of the country. In obstructing the course of justice, they have set up a plea that the United States has no jurisdiction in trying men wearing the uniform of the United States Army, who are charged with shooting their officer, while he was engaged in training his troops on an army reservation in time of war.

When a man confesses manslaughter and incriminates a supposed accomplice, the public officers who failed to proceed with the case would be liable to removal. But because they insisted upon the performance of their duty, an avalanche of attacks has been launched upon the chief law officers of the government, from the Attorney-General to the United States attorneys of the Federal districts, down to the agents of the Department of Justice who, in one way or another, have been identified with the case in widely separated parts of the country.

In this campaign, aspersions have been cast upon the young officer who was killed, his father has been attacked, and even his mother has not been spared.

One of the accused men has had the temerity, in public prints, under his own name, to charge that government officials promised him to drop the case if he would get his rich friends to put up money, and he has predicted a coming impeachment of the Attorney-General. **Is it possible that any organization in this country has the power to obtain, for racial reasons, the impeachment of a United States Attorney-General** because he is active in the performance of his duty?

In view of the fate that overtook a one-time governor of the state of New York, in similar circumstances, several years ago, this would not seem so improbable. An unfortunate youth, who had offended a Jewish Wall Street banker, had been sent to state's prison for the fearful term of 30 years. Time passed, but the cruel story came to light. A grand jury exonerated the convict, and pronounced him not guilty of the crime that had been charged against him. He was released from prison by the governor. But the father of the banker, himself a financier of wide influence, was infuriated by the fact that a public official had dared pardon the unfortunate, and it was on his testimony—which he had the power to withhold, had he so wished—that this same governor of the Empire State was impeached and removed from office. *Persons identified with this heartless affair were members of the same organization which is now protecting Rosenbluth.*

The other day I asked a prominent official of the government, "Do you believe these people will go to the length of obtaining a habeas corpus writ, and appealing their case to the Supreme Court?"

He responded quickly: "It would be a foolhardy act. *If they maneuver to keep these men from pleading to the indictments found against them in Tacoma, the Rosenbluth case will never be forgotten—it won't die in men's memory.*"

Statements made by a former member of the 213th Engineers, started agents of the Department of Justice on a hunt for Robert Rosenbluth, once captain, and Rolland R. Pothier, former sergeant bugler of the regiment—the two witnesses to the death of Major Cronkhite.

Robert Rosenbluth is a man now from 44 to 45 years old. He is rather short and thickset, and inclined to be careless in his attire. In appearance he shows his descent from an East European race. He has earned himself the reputation of being a great talker.

Left the Country Hurriedly

THE department agents learned that, after he had been mustered out in January, 1919, Rosenbluth immediately made haste in getting out of the country. He was away for more than a year and a half, evidently on some private mission of his own. When he returned to the United States, he was kept under surveillance for several months, and was then arrested, in March, 1921. When arraigned before United States Commissioner Hitchcock, in the Federal Building, New York City, Assistant United States Attorney, John E. Joyce, stated that the government had in its possession evidence sufficient to hold the man on a charge of murder.

At the time of his arrest and arraignment, Rosenbluth said that *he had been in Siberia, Turkey and other countries, engaged in collecting information and statistics, which he sold on his return here, to cover his traveling expenses. He told the agents that he could not understand how a shot by Pothier could have killed Major Cronkhite, because he had been standing between the two men when the shot was fired. His version of the shooting was that a bullet which struck a metal can had been deflected, killing the young officer. "I have absolute confidence in Attorney-General Daugherty," he said. "I am willing to return to Tacoma immediately and face any charges. I demand an open hearing and a real investigation."*

The above statements of Rosenbluth have been italicised, because, as shall be shown, later, in view of developments, he absolutely reversed them all.

Rolland R. Pothier is a short, stocky man, with a dark complexion, 28 years old, and of French-Canadian descent. Eight months after the shooting of the major, he was discharged from the army. He disappeared, was heard from in various sections of the country, and was finally located in Rhode Island, where he was working as a brakeman on the New Haven Railroad.

A man in the position in which Pothier then found himself, questioned and harassed by agents of the government, is like a trapped animal. He turns this way and that, he prevaricates, he contradicts himself. But the testimony of former comrades was quoted against him. His young wife pleaded with him to tell the Federal agents everything. Father Liberté, the priest of his church in Central Falls, Rhode Island, visited him and besought the wretched man to bare the truth. It was to his priest that Pothier first confessed that he had shot Major Cronkhite. Then, finally, a confession of the entire circumstances was forced from his reluctant lips.

Statement made by Rolland R. Pothier at the Providence County Jail, Howard, Rhode Island, March 24, 1921.

I, Rolland R. Pothier, on oath, depose and say that about four or five days before the shooting of Major Cronkhite, Captain Rosenbluth called me over to a space behind headquarters company and asked me if I was any kind of a shot, and if I ever handled a pistol before; that I answered, that the only time I ever handled a pistol was at target practice and he asked me where, and I said at Panama; that he then said: "You don't have to be an expert for what I want you to do"; that I did not ask him what that was; that he then said: "All right, I will see you later"; that I then left him and went to my quarters.

That on the next night, or the night after, I again met Captain Rosenbluth at the same place; that he asked me if I was going out with the school of reconnaissance and I said that I had heard nothing about it; he told me that it was for all noncommissioned officers, and he didn't see any reason why I should not go; that I said: "If that is so, I guess I am included with them." He then asked me if I remembered what he had said to me the other night about firing a pistol; I answered "Yes," and he then asked me if I had any idea what it was for, and I answered "No"; that he then said: "I want to get Major Cronkhite"; that I asked him what he meant, and he said: "I want you to kill him"; that I asked him what his reasons were, and he said: "Because we want to get him out of the way"; that I asked him why he wanted to get the major out of the way, and he said: "You never mind. You will find out later"; then I asked him whom he meant by "we," and if I was included in it; he said: "No, you are not included in it"; that I then said: "How am I going to get out of this thing if they put the blame on me?" and he said: "Never mind, I will see that everything will be all right"; that I then asked him how he would see that everything would be all right; he answered: "If you get sent to jail, I will get the best lawyers I can to get you out of it"; that I then asked him about the disgrace on my father and mother, and he said that he could not say anything about that; when I told him I was the only one who would suffer, he told me that he would see to that, and I need not worry about it; that I then asked him how I was to do the job, and he then asked me if I had ever been to this place before (meaning Camp Lewis) and I told him that I had not; he then said: "I have looked over the maps, and from what I could see, I think I have found a good location for it (meaning the killing of the major) and when we get there I will tell you. Be sure that you get him in a good place, so that he won't have a chance to say anything"; that I asked him where he wanted me to shoot him, and he said: "Of course you will be standing on his right side, and it won't be a bad idea to get him about here" (pointing to a spot about even with his heart); that I asked him what I was going to do after I shot him, and he said: "You never mind, I will be somewhere around, and when I see him fall, I will run up and grab him"; that he said further: "Then I will yell for a doctor and get him down there, and we will go about it just as if he shot himself. If there are any questions asked, I will tell them that he shot himself accidentally," and that I was to say nothing; that I said: "Suppose they ask me how it happened?" and he said: "You tell them it was target practice, and that the major shot himself accidentally, and everything will be all right"; that he then said:

Hollywood Again

IN SPITE of the press agent stuff which followed the Arbuckle scandal, and the assurance then given the country that Moviedom was a quiet place where the people drank tea and went to bed at 9 o'clock and attended church on Sunday—in spite of that, and emphatic of the falsity of all that, scandal has broken loose again.

And it is going to break loose again and again and again. There is no stopping it now.

Because, the whole business is enmeshed in stupidity. Two years ago, men who were really interested in restoring or creating a decent reputation for the business, took up with the chief rulers of Moviedom this very dope business. Also, one of the chief figures was named on a Federal warrant and was about to be arrested. What happened? Why, the chief rulers, aided and abetted by the social and political lights of Los Angeles ordered "hands off!" and even the Federal warrant was not served.

These things are known. Things still worse are known.

The most hopeless element in it all is that the newspapers know all this stuff beforehand, yet never lift a hand concerning it until it "breaks," as they say. And then they wax tremendously indignant about it. But, of course, the newspapers, like the movies, are paying for that kind of betrayal. Public confidence in a newspaper is in direct ratio to its public service. The newspapers render all kinds of propaganda service, but very few of them know what public service is.

In the midst of all this, the country turns to that good Presbyterian elder, Will Hays. His Presbyterian eldership is not referred to in a spirit of flippancy. Frankly, it was the most hopeful fact about Will Hays when he threw in his lot with his present employers. There is something about sound Presbyterianism that unmistakably asserts itself when it comes in contact with organized rottenness. Which, of course, is only one way of saying the same thing about Christian taste and temper generally.

And what was Will Hays doing about this time? He was dickering for a return of Fatty Arbuckle to the central circle of the American Film! And he was handing out sob-stuff about other doubtful persons. It is not that Will Hays has actually ordered the return of Arbuckle, nor that he has done other things—these are not the fatal elements; the fatal element was that he thought he could do it and make it stick. It proves conclusively what many have suspected, that Will Hays' fundamental disqualification is his inability to understand the psychology of the American people. And this is the more surprising because it was upon that supposed ability that his reputation has been built. Whether Hays has been kidding himself, whether he has made himself believe that maudlin sentimentality is moral sentiment, whether the success of his make-believe personal friendliness by letter in his mail-order campaigns and his capacity to stage effervescent good will has deluded him into thinking that he could pursue that course forever, are questions which a few observers have answered in the affirmative from the beginning.

He has made not only a serious mistake, but a fatal one. Perhaps it was inevitable. If his employers hired him to smooth things over, they have got what was coming to them. Any man, "white, free and twenty-one," whose mind could harbor the thought that he could work the Christmas Good Will feeling to bring Arbuckle back into the eye of the American people, into schools and recreation centers and public halls of entertainment, for the sole purpose of loading hundreds of thousands of dollars on that over-rated young man, and millions of dollars on his "owner," shows an incurable defect of judgment. It might go in politics; Will Hays has seen it work in politics many a time; but it wears out. It has worn out now. The American people are not vindictive nor would they hound poor Arbuckle. They would not prevent his earning a living. Only they object to his being established in the easiest chair in the national parlor, so to speak; they think it would be better taste if he were to work out his salvation in more modest ways. The net result is that the hard common sense of the American people has made Will Hays' Christmas nonsense look pretty sick.

In the midst of all this, what is to become of Mr. Hays himself? His employers do not like to retain stage failures. And he has failed, right in front of the footlights, with all the Christmas scenery falling on him. It has been predicted for months that Will Hays would do one of two things. Either he would pull off some superficial improvement in Moviedom and then resign in a properly press-agented blaze of glory, bowing to the American people and declaring that he had accomplished the great work he had set out to do; or, failing to get his employers to improve even superficially, he would pull the indignation stunt and throw up his munificent salary, protesting to the American people to witness the integrity of his soul by his sacrifice. After the Arbuckle incident, it is difficult to see how he can do the first. And, after the Arbuckle incident, it is more difficult to see how he can do the second.

It appears that Hays' employers have jockied him into an awkward position. They are experts at that.

All that remains now is another deluge of publicity dope telling how really nice Moviedom is.

Then—Crash!—with the next scandal.

Put Up or Shut Up, Mr. Kahn

OTTO H. KAHN, who likes to have Europe regard him as the financial ambassador of the United States, and who usually talks as if he were, although goodness knows that the people of the United States are not aware that they have the honor of being represented by him, is at it again, advising the people of the United States as to the course of conduct they should pursue with regard to the war debts.

In whose interest, that is, in what national interest, Mr. Kahn may be speaking, is not clear. Born a German citizen, acquiring British citizenship, and at a recent election having his assumed American citizenship called in question, it is not clear what nation is the proposed beneficiary of Mr. Kahn's remarks, although the natural presumption is, Germany. Mr. Kahn's firm has never relinquished its close German relations; indeed, Mr. Kahn's firm may be described as the American branch of a German-Jewish house—none of the partners, that is, none of the "American" partners, being American-born, nor even distinctively American in their thought.

It may be thought a trifle indelicate to make these allusions, but it is nothing to the indelicacy of Mr. Kahn in assuming to speak to or for this American nation. The man's vanity is somewhat overdue for a pricking, and it is certainly the duty of someone in authority at Washington to drop a word at London and Paris that Mr. Kahn's canned statements on international financial affairs may be perfectly legitimate as propaganda for the plans of the house of Kuhn, Loeb & Company, but are certainly not the unofficial utterances of any one in authority. On second thought, THE DEARBORN INDEPENDENT would become rather insistent that a sufficient authority at Washington do this very thing, quietly and effectively. The spectacle has gone too far for our national dignity as it is, much too far.

The only right which Mr. Kahn has in the matter of debt cancellations is to cancel some of the obligations which he and his partners hold. Unless he thinks the public is too great a fool, it must occur to Mr. Kahn at times that his fervent pleas for financial aid for the countries abroad in which he is interested would come with much better grace if he and his associates were to set the example.

The people are well aware by this time that the reason bankers of Mr. Kahn's type want the government to do certain things is that these bankers may then have easier squeezing of the debts which will not be canceled. It is comparatively easy to be generous with the Liberty bond dollars—but what about the same policy with reference to a few Kuhn, Loeb dollars? It would at least purchase Mr. Kahn the right to talk, a right he does not possess.

The Bonus

ONE fact concerning the soldiers' bonus has never been disputed: the money lenders will get more than will the soldiers. That is a fact which should be kept to the front of the discussion. Amid all the propaganda, ranging from the veriest melodrama to the stern assertion that a certain organization has demanded the bonus and is going to get it if for no other reason than to prove its power with the United States Government, amid all the drifting talk for the bonus and against it, let that fact stand out and let the soldiers themselves face it.

The whole bonus question has fallen into an unfortunate posture. What should have come, if it had come at all, as a gift from the people, a national gesture of gratitude, has become instead a demand, and, much worse than that, a political football. The whole bonus aspect of the matter has been wiped out. The spirit of generosity and gratitude has been completely eliminated. The question has descended to the region of cold finance, and the ugly fact confronts us that whatever sum may be given to the soldiers, a much larger sum will be given the money brokers.

If the question should be put up to the service men in this form: *Are you in favor of giving the money brokers another big chunk of war profits in the shape of a bonus larger than Congress would give you?*—would the soldiers vote for it?

It is well understood that one of the grievances the returned soldier has against the whole business of which he was a part, is that while he was giving himself to the army, the profiteers at home were looting the country. The expression of this grievance is justified. No more hideous form of gain exists than that which coins the war distresses of a nation. Not the soldier only, but the nation joins in the condemnation of it.

Yet, it is to these money brokers, the chief beneficiaries of the war, that the United States Government will have to go to borrow money for the bonus, and in borrowing will agree to a rate of interest which will certainly give the brokers about 25 per cent more than the soldiers would receive.

In one of the states, a bonus was given the soldiers of that state. The sum given was $30,000,000. The sum which the money brokers will eventually collect will be $57,000,000. It will cost the soldiers resident in that state as taxpayers just $87,000,000 to handle $30,000,000 in very small driblets of dollars per man.

There ought to be some expression of opinion on this aspect of the question from the prospective beneficiaries of the bonus. They represent the generation which will be paying the bulk of the taxes during the life of the loan. For the next 30 to 50 years the soldiers who may receive the bonus will be paying it back—nearly double. And the interests to whom they will be paying will be the same interests that have already swamped the world by their unholy profits.

Do the soldiers vote to give them another big slice of war swag?

The likely thing is that, from this point of view, the soldier would vote No.

This does not necessarily dispose of the bonus. Does young America as represented in the disbanded legions have no suggestion to offer which would eliminate the money brokers? Does the young soldier relish the spectacle of his Government being compelled to go down to the money barons and beg for money, paying a stiff rate of interest for the very money which the government certifies, and gives these same barons the right to issue and circulate? Does the soldier, honestly witnessing such a spectacle, feel that it is just right? Does it not strike him as being wrong somewhere, even though he may not be able to say just where it is wrong?

Does he think he is justified in forcing the government to do that, if there is another way?

Does he not think that one of the greatest services the legions can render the country is to set its multitude of minds to work to liberate the Nation from bondage to the masters of money? Would it not be the winning of another great war, the conquest of the cause of all wars, if the legions could restore to the United States Government control over its own money?

It is a question which will repay the serious thought of every man who saw service in the army. Here, in connection with the bonus discussion, is another service that may be rendered the country. Let the legions ponder it.

Mr. Ford's Page

ONE IS sometimes asked what is the greatest hindrance to a satisfactory life. A satisfactory life is one that fulfills up to the highest measure one's capacity for achievement and the sense of accomplishment, and then widens and deepens and develops that measure so that the man shall become better and bigger than his success. The only value of success is that it has made the man bigger, and anything that makes him bigger in power of mind or keenness of insight has been a success. This, of course, will differ with different people. We can only have the experiences we are able to receive and make use of, the rest slips by us.

The first thing to do is to get the material aspect of the question out of the way. We are rapidly moving out of that stage of human experience where success meant that a man had enough food and comfortable furniture. We get a sidelight on human nature when we remember that these were once thought the prizes of life. All that is changed: we believe that these creature necessities and comforts are the rights of all who work; and the steady readjustment of industry, wherever its leaders are awake, is toward the guaranty of these things. We are approaching a stage where success will be measured by something besides the fact that one man has a comfortable chair to sit in and the other hasn't. When both have chairs, because they both ought to have them, then the measure of success will be based on something higher.

So, with that taken care of, what are the chief hindrances to men finding that satisfactory adjustment between work and their own minds which is the essence of happiness? The chief hindrances are Fear and Pride. We hear a great deal about Fear, almost everyone has learned what a corroding influence it is, and everyone condemns it—but how many have succeeded in getting from under it?

Nothing is easier than to tell a man to get rid of fear. To tell him *how* is another matter. No one can *tell* him anything about it, but it always happens in the good providence of things that when a man has come to the point where it is possible to liberate him, some person or some idea is there waiting for him to help him accomplish it. Those are emancipated who are ready and willing.

Most men were born with fears of one kind or another. Some few have never known a fear. When men are young in fear, it is the Thing which they cannot see that frightens them—they are afraid of the dark. And the Thing they fear is never there. Then they grow older and they begin to fear many other things, and the difference is this—the Thing they fear is *there*, but it isn't worth fearing. The Thing that is there, tangible, understandable, is never worth fearing. That is the difference between childhood and maturity regarding the things they fear; in childhood we fear the unknown, in manhood the known. The one is fear of mystery, the other is a species of cowardice. We are gentle with the child in its fear, but with men the only treatment is to tell them to "come out of it!" Cowardice—too cowardly to face the experiences that everybody faces—Fear is too high a name to give it. Men, who do not fear God and yet fear men, need not be given too much dignity as to their emotions.

Pride is something of the same thing. Men are constantly getting out of the cowardice they misname fear, but Pride presents another problem. Half the opposition to industrial reorganization comes from Pride. You go into a shop and try to put it on a basis of successful operation and you will find nine times out of ten that the things you have to change are the very things in which someone takes an inordinate pride. Very recently the rebuilding of a broken down industry required the change of a certain practice. Analysis of the matter showed that this practice was at the core of the whole failure. The manager wanted to save this practice at any cost, because it was his, he had a pride in it. The clash came right there. Pride was stubborn and blind, and it had to be overridden. But the factory began to pick up immediately, like a patient which had never had right treatment before.

> *THE wrong kind of pride has wrecked many a career. It usually roots in the wrong thing. Observe for yourself and see if it is not so, that a man given to pride is usually proud of the wrong thing. Some men are so proud of their method, their system, that they think it is more important than the job itself. Touch their method and they bristle with indignation, although it may be that their method is ruining the job. The job is the thing. Become more job-centered and less self-centered and there will be less friction, less personal "touchiness" in business. Be ready to revise any system, scrap any method, abandon any theory, if the success of the job requires it.*

The instances where Pride has proved the hindrance in business are so numerous that one could go on quoting without end. It is peculiarly the hindrance of the professional type of mind. There is something about professional training which, in some natures, not in all, breeds a very unpleasant feeling of superiority. That is, it is unpleasant to one seeing it from the outside, and it must be extremely unpleasant for anyone to carry around inside himself. You set this type of mind at a task and presently you see it building up methods, and methods, until it is encased in a castle of methods, and very soon the operation of the methods takes so much time and energy that nothing is left for the main job. This type of mind likes sheets of paper more than people, and written reports more than first-hand performance. After awhile, if you try to release it from its castle of card indexes, if you try to liberate it from its delusion of office fussiness, then you come against that mighty obstacle—Pride. Ah, the man takes pride in his system! he revels in his method! Touch that, and you touch his life! He will be blind while you show him that his system does not reach farther than the four walls of his office; he will be deaf while you tell him that achievement must show elsewhere than on paper—the obstacle of Pride is there, and another clash is imminent.

We have just spoken of Pride as the obstacle, but that should be explained: it is an obstacle only to the man who lives on it. Its weakness is that anyone can wound it, and only a little authority can completely overthrow it. Its weakness is that it usually roots itself in the wrong thing. Practice a little observation and see if it is not the case that a man given to pride *is usually proud of the wrong thing*. He plants his pride where he cannot defend it, where it cannot defend itself.

Now, in business the job is the thing. When men are job-centered they are less self-centered and there is therefore less soil for the interference of personal likes and dislikes, personal prides or personal prejudices. If there is any pride, it is centered in the job. If there is any prejudice, it is with reference to the job. The job is the thing. Any method is willingly revised or abandoned, any cherished theory is immediately scrapped, any personal element is completely sunk, in the great central importance of the job. If a job isn't big enough to command this sort of allegiance in a man, he should make it big enough, and if he can't do that he should find one that is big enough. There are many jobs that must disappear too—picayunish jobs that do not contribute to the general welfare; jobs that drain the real job, jobs that cannot compel the loyalty and admiration and zeal of men. The time is coming when men will not merely demand the right to work, but they will demand the dignity of a work that counts for something. Society is already getting rid of the things that do not contribute, and industry will speedily get rid of the spirit that does not contribute.

The wrong kind of pride does not contribute. It deceives the man who harbors it and hinders everyone within the radius of its malign influence. It has wrecked careers that might have been useful. When a man falls in love with his way, his method, his system, and exalts them to the place of chief importance; when he resents competent criticism and change designed to focus his attention and efforts on the central job, he is then on the downgrade. Employers will know what this means, and so will many employes. Get rid of the wrong kind of pride. To be sure that you have the right kind of pride, just examine whether it focuses on the job.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Mummers' Parade—an American Event

Nothing Like Philadelphia's New Year Spectacle Anywhere in World; No Program, But Attracts Million

By WILLIAM A. M'GARRY

Winner of one of the many mummer prizes offered by the city.

Hobbyhorse mummers.

ACROSS section of the beauty and splendor of barbaric pageantry common to all races of man in the early days of their development has just been staged in Philadelphia. It brought together approximately 5,000 volunteer performers, some as individuals and some in groups or clubs, in the weirdest collection of costumes imaginable, ranging from the flimsiest of dancing girl tights to elaborate cloaks weighing hundreds of pounds and requiring the assistance for the wearers of scores of pages.

Philadelphia witnessed on New Year's Day all that color and spectacle in the form of the annual Mummers' Parade. There were more than a million spectators. A quarter of that number were visitors, many from points as far distant as Chicago.

There is nothing quite like the Mummers' Parade anywhere else in the world. Historians assert that the general idea back of the parade can be traced far back into the dawn of history. Specifically, it is an unconscious revival of William the Conqueror's first riotous Christmas in England and of the festival directed by the "Lords of Misrule" who came after him a few centuries later.

Although the Mummers' Parade has become almost a national event, it has no directing head. The truly amazing feature of it is its absolute spontaneity. During the 70 years it has been held a number of clubs have been organized and developed, but in addition there are hundreds of individual participants. Another curious fact is that all the paraders, until recent years, came from a single district; and even now fully 90 per cent of those in line are from that unique section of Philadelphia locally known as "The Neck." The original city was located between the Delaware and Schuylkill rivers about five miles from the junction of those streams. The land widens with bends of the rivers just before the junction is reached. For years uncounted that territory, never fully built up, has been a great truck-farming section. Just to the north is the melting pot, with every race in the world represented, but in "The Neck" nearly all the residents are American-born, many of them tracing their ancestry back far beyond the Revolution.

Some explanation may be found for the imagination and dramatic ability back of the Mummers' Parade when it is stated that "Neckers" and their offspring in South Philadelphia are generally credited by vaudeville comedians with the invention of a great majority of the slang terms in general use. All the great stage comedians take occasion to visit the pool rooms and other gathering places of the section every year or so. There they pick up snatches of slang and "smart cracks" to be retailed later all over the country. That is the background of the Mummers' Parade.

The procession moves over a stretch of about 15 miles on Broad street, nearly the full length of the city, and sometimes continues on leading business thoroughfares. Attempts to describe it have been made time and again, but always they have failed to do justice. In general terms, it is a peaceful riot. It has many of the features of the circus, including clowns. Clubs go to elaborate lengths in the building and equipment of floats to satirize some national or local issue. Traditions that underlie the custom in this country have been changed and corrupted by time until the parade, in addition to all of that, is a curious combination of festivals that originally bore no relation to one another. Yet it is remarkable for the methods and ideas of celebrations that it has preserved intact.

Historians have definitely traced the origin of many of the mummers' features back to the Battle of Hastings in 1066 and to Taillefer, one of the Norman minstrels, who rode in front of the invading army, singing the song of Roland, Charlemagne's heroic captain, as he charged the English line. Taillefer has been called the "king of all the mummers." It is held by some authorities that Taillefer's death was commemorated the following Christmas, when the Conqueror was crowned king of England, with a magnificent feast, which was later imitated by his barons with their minstrels and jugglers. Longfellow has sung of those old Christmas celebrations;

In the Hall, the serf and vassal
Held, that night, their Christmas wassail;
    Many a carol, old and saintly,
        Sang the minstrels and the waits.
And so loud these Saxon gleemen
Sang to slaves the songs of freemen
    That the storm was heard but faintly
        Knocking at the castle gates.

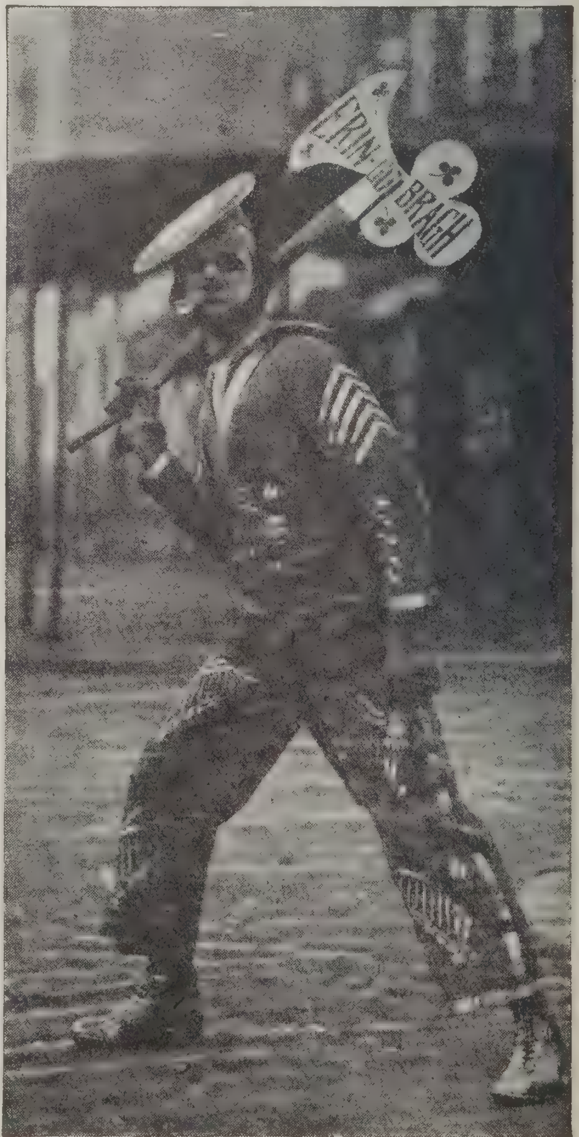
"Within a couple of centuries," says one historian, "the festival was extending over weeks, and the English kings, with a joyous people helping them, were celebrating all the way from Halloween, in the latter part of October, to the day after Purification, early in February. The very Halloween disguises we indulge in nowadays belong to those ancient days. When Edward III held his grand Christmas Festival at Guildford, orders were given to manufacture for the Christmas sports 80 tunics of buckram of different colors, and a large number of masks, some with faces of women, some with bears, some like angel heads of silver. There were mantles embroidered in heads of dragons, tunics wrought with heads and wings of peacocks.

"A lord of misrule was appointed, who reigned during the whole of the period, and was called then the master of merry disports. There was nothing but a succession of masques, disguisings and dances of all kinds. All the nobles, even the Mayor of London, had an officer of this king chosen in their households."

Historians agree that bone-breaking features of the festival were abandoned during or after the time of Henry VIII, after which the celebration in England became a splendid pageant with extravagant set scenes and a curious medley of nymphs, savages, heathen deities, Christian saints, giants and hobgoblins. The type of men that took part in the celebration in those days is described in one of King Henry's regulations for the liberties of the lower classes in popular games, and allowing for differences in definitions the description fits the Philadelphia mummers. The monarch put into the "lower classes" all manner of "artificers or craftsmen of any handicraft or occupation, husbandmen, apprentices, laborers, servants at husbandry, journeymen, or servants of artificers, mariners, fishermen, watermen or any serving men."

It was during the reign of Edward VI, however, that the "mummeries" came into the greatest splendor. That was due in great part to the rise of George Ferrara, as the "Lord of Misrule" of whom Mollinshed wrote:

"By order of the Councell, there was a wise gentleman and learned named George Ferrara, appointed to the office of Lord Misrule, who, being of better credit



One of the mummers who attracted considerable attention.

and estimation than commonlie his predecessors had been before, received all his commissions and warrants by the name of the master of the King's pastimes. Which gentleman so well supplied his office, both in show of sundry sights and devices of rare inventions, and in acts of diverse interludes, and matters of pastimes plaied by persons, as not only satisfied the common sort, but also were verie well liked and allowed by the Councell, and others of skill in the like pastimes, but best of all by the young king himselfe, as appeared by his princelie liberalitie in rewarding that service."

Philadelphia now owns virtually all that is left of the ancient outdoor English Christmas, for the last survivors beyond the sea are some lads who, distinct from the mummers, yet closely akin to them in origin and time of observance, are the sword actors of the annual open-air play, "The Seven Champions of Christendom," in the vicinity of Leeds. Disguised with false beards, they dress in costumes appropriate to the occasion as their knowledge and finances will permit.

As originally revived in Philadelphia the mummers offered little more than a reminiscence of the English saturnalia celebrated under the direction of the first lords of misrule. How the custom developed here the historians never have been able to determine accurately. It is known only that 70 or 80 years ago, in the sparsely settled sections of South Philadelphia, parties of young men dressed in fantastic garb appeared on New Year's Day, going from house to house and demanding dole, and reciting rhymes explanatory of their customs. One historian writes of the early Philadelphia mummers:

"These mummeries, however, did not find favor with all the people. In fact, Christmas itself was not generally observed. The Quakers did not incline to the commemoration of holidays, nor did the more rigid of the Protestant sects, especially the Presbyterians."

Nevertheless the custom flourished. About 50 years ago some of the independent bands parading the streets of their home sections began to join for more elaborate processions into the more built-up districts of the city. But it is only within the last decade that the Mummers' Parade has become a real institution, and even in that period its continuance has been threatened. Nobody knows definitely until the day of the parade how many clubs and individuals will be in line.

Each year the city council of Philadelphia hangs up about $12,000 in prizes, and in addition various business men's associations now encourage the celebration by appropriate prizes of cash and merchandise. The total value of all the prizes, however, fails to equal the cost of the spectacle. Therefore, while its commercial value to the city runs into the millions, the celebration itself has not been put on a commercial basis. Some of the mummers spend all their leisure time from one year's end to another preparing for the parade, without any hope of reward in money. The affair has even taken on, indirectly, some of the brutality of early celebrations, although that is more accident than design. Nearly every year there are deaths of mummers as a result of exposure. The female impersonators particularly take desperate chances with the weather. Last year three of them collapsed from cold before the parade had reached the center of the city. They were clad in ballet costumes offering no protection from the weather. Dancing through 15 miles of sleet in such a costume is not exactly conducive to good health. Police regulations have been made from time to time in the effort to protect such performers, but they have been rescinded at the last moment because if there is any interference the whole parade stops and the clubs refuse to march.

Attempts have been made also to transfer the spectacle to other cities and to new routes. New York business men once offered a quarter of a million dollars for a parade of the dozen leading clubs and the prize-winning individuals, but as soon as the Philadelphia parade was over the mummers lost interest and refused to go. Many other incidents might be recited to show how deeply the roots of the spectacle are lodged in a single section—South Philadelphia. Every year new clubs turn up from other sections, but as a rule they disappear after a year or two. It is a saying in the Quaker City that mummers are born only in South Philadelphia.

Life in the Hungarian Capital in 1922

BUDAPEST, the one-time proudest city in Europe, is today the most humiliated. The treaty of Trianon is the underlying reason for the misery in all Hungary, and especially in its most beautiful city. The perspective of the tourist, however, is different. He sees only luxury, happiness and gayety; he mingles with the crowds in hotels; the personality of the city is wrapped up in the poorer neighborhoods and its inhabitants.

The cafés which made Budapest famous are filled with guests from 4 o'clock until midnight where a band of Gypsy music plays Hungarian rhapsodies, folk songs, American jazz, and Oriental selections of the Broadway variety. The other night in the Café Palermo I enjoyed the "Poet and Peasant" even more than I did last year in Carnegie Hall, played by some Russian artist. These Gypsies play by ear, never having studied notes, and yet their music is as sweet as Mischa Elman's or Fritz Kreisler's. They are not paid but are permitted to take up collections, and they do this quite diligently.

The well-to-do of course are the leading class in the better houses. They come with their wives and grown-up children. The clerks are next. They come merely to be seen among the rich. This is a typical disease in Budapest. A clerk may have no more money in his pocket than the price of a tea or black coffee (35-50 crowns, 3-5c) but he will go to a café after he is through with his day's work. It is, as they have called it here for years, the "Budapest way of finishing the day."

Another class is the commercial agents who meet their clients to close a deal. Not infrequently the café is the stock exchange in Budapest. Whenever the National Bourse (exchange) is closed, all its activities are transferred to the café. One meets his friend or makes appointments. In a word, every man has his favorite café. The poor men, the working class, have their own clubs, which are not quite so neat as the old American saloon. They sit around little tables, spending but the price of a glass of beer (2c), discussing the outlook. Politics are the most favorite theme in these places. One must watch, however, for secret service men, for a little remark against the existing government brings jail without a trial. It happens often that one is sent away to some internment camp without being tried before a legal court and there he is kept indefinitely.

As in other European countries today, so in Hungary, one pays many extra taxes, but I know of no other country where eating an evening meal is considered a luxury by the government which collects from 10 to 20 per cent taxes for it. In some restaurants a special tax is charged for tourists at any meal, the dining cards in the first-class hotels are so made up that the food prices are marked in Swiss francs and its equivalent in Hungarian money. If the exchange changes, the prices too are changed. And this holds true of everything one buys in the stores. It happens quite often that one prices a pair of shoes to learn they are 10,000 crowns, the same pair upon inquiry the following day are 11,000 or 12,000 crowns. I never yet have noticed that prices were cut. When I arrived here last May, I paid for a room in a first-class hotel 1,500 crowns a day for which the charge is now 6,500 to 7,000 crowns. Prices are up at least 400 per cent since last May, and are still going up. A suit of clothes last May was 30,000 to 35,000 crowns. Today it is 100,000 to 150,000 crowns. (The dollar is equivalent to about 2,500 crowns)

It is law that no oranges can be brought into the country. The reason given is that they are a luxury and the people must spend no money for things that are not absolutely essential. The secretary of the national treasury holds that if we buy oranges our money is bound to depreciate because it goes to Italy in payment of the southern fruit. One firm smuggled through a cargo of oranges but the government confiscated the whole shipment and destroyed the fruit. There are other things which, although brought from foreign countries, are sold. Such articles are: Tea, cocoa, dried fruit and sardines. The middle class cannot afford to drink tea, milk is scarce, coffee is substituted, and so the people do not enjoy these things at all.

According to law recently enacted it makes no difference as to how much the excess amount may be in an allegation of profiteering, the severest punishment is meted out to whomsoever the law catches as an offender. The fines consist of money and goods to be restored, plus a prison sentence from one month to two years. Whenever one is thus found guilty, a daily occurrence, the charges and sentences are posted in conspicuous places as well as in the offender's own shop or store for 60 days. On such posters the name, age, occupation and religion are given.

Children born during the war do not know the taste of fresh milk. Only the rich can afford to drink milk. The milk supply is very limited, philanthropic institutions are not supported, hence the misery among the poor children.

If one sits in a café, restaurant, church or railroad car he will always meet the beggars. Some are ex-service men, crippled, of course, others are pre-war beggars, old women, men and children. They go from table to table, leaving out no one. People get so used to giving that seldom is one turned away. The strange thing is to see little boys and girls of six, seven, eight or ten years, ragged, shoeless, with two or three boxes of matches to sell, but chiefly soliciting alms for a sick mother or blind father.

These children, as well as the underfed adults, betray a very marked degree of feebleness and stupidity. Their moral life is at par with the habitual criminal, according to numerous tests made. Generally speaking, there is no society nor individual morality left in the country. Everybody seems to believe that it is of no use to be good or kind.

Budapest had the best lighted streets in the world. There were acetylene, gas and electric systems in use at once. Lamps were 10 yards apart, and higher up, about the third floor, were the 500-candle power electric lights 50 feet apart, and the acetylene lights every 100 feet. These looked like moons above the streets. All gas lamps are gone; they have been sold for old iron. Only electric lights remain. The city is quite dark. This is due to the coal shortage. The treaty of Trianon allotted all coal mines to Czecho-Slovakia and Hungary has to buy coal from the Czechs.

Confidential orders from the ministry of the interior to the various police chiefs (police are under the supervision of the minister of the interior in Hungary) call for the registration of all Jews of alien origin within 48 hours to ascertain the percentage of those who came into Hungary prior to the war. Later, it is stated, these will be returned to the country of their birth. The order mentions only Russian, Polish, and Galicians. All this is done, according to the order, to save Hungary from the Jews. Only last night the government party held its regular weekly meeting and the Jewish Question was discussed very critically. This is one of the greatest problems in Hungarian national politics, how to solve the Jewish Question. There is no official anti-Semitic program in Hungary, and members of the government deny such intentions, but there is a serious Jewish Question.

Picking a National Flower Is a Pretty Problem

Plenty of Possibilities, But Opinionated Public Just Can't Agree

By CARL SCHURZ LOWDEN

FRANCE'S national flower is the lily. Germany swears devotion to the bachelor's button which got its name from the custom of love-smitten swains to tuck it in a pocket when they a-wooing went; supposedly, no sweetheart could resist the combined charms of the dainty blossom and the artful Romeo. Egypt's emblem, the lotus, has the romance of Germany's with the purity of France's selection; for it is

> "A flower delicious as the rose,
> And stately as the lily in her pride."

Italy loves the daisy as the sweetest bloom that grows. India, as might be expected, adores the gorgeous poppy. In Holland, the culture of the tulip has been carried on since the seventeenth century. The classical olive brings sentiment to the heart of a Greek. The blossom of the orange is Spain's favorite, and the people of Peru prefer the gold of the sunflower.

The Sunrise Kingdom has never been able to make up its floral mind. Both the cherry blossom and the chrysanthemum, which the Japanese call "long-lasting plant," play a leading part in their arts and decoration.

Evidently two flowers are one too many; yet Great Britain claims three. In the British coat of arms the rose, thistle and shamrock grow from the same stalk. The shamrock represents Ireland. The rose is England's; it was adopted after the "War of the Roses." The thistle belongs to Scotland.

There is a stirring legend of how Scotland got its emblem. According to the common tradition, warring Danes attempted an assault on Staines Castle one night in the year 1010. Their footwear must have been in poor condition; for one of the invaders tread upon a thistle, gave an involuntary exclamation of pain at the sharp pricking of the spines and thereby gave the alarm to the unsuspecting Scots. The defenders then immediately attacked the enemy and gained a complete victory. In gratitude to the thistle that had probably saved them, the valiant fighters cherished the blossom thereafter to such an extent that they wore it on their coats.

With one exception, each of the foremost among the world's nations has a flower all its own. That exception is the United States. You may wonder why we are, in any respect, behind the other powers; we should not be, yet the situation can be explained logically enough.

A member of Congress has some constituent who is a devotee of a certain flower. He or she suggests that a bill be introduced to make it the emblem of the nation. An impressive petition may accompany the plea. The Congressman can see no harm in the measure; so he prepares it and starts it on its course. Advocates of other blossoms unite to oppose it, and the bill dies painlessly in some committee room. If jealousy does not end its life, the steering committee gives it the once-over and justly decides that it will not put more coal into family furnaces this winter or reduce the number of strikes or render any vital service to mankind. Congress has a habit of talking and talking until the final minute, then discarding every bill that cannot be classified as important. We need a Congress that has time to consider the esthetic side of our national life.

Only a few months ago Representative John Kissel, of New York, introduced a bill naming the demure daisy, poetically known as the eye of the day and euphonically as the day's eye. What happened? The measure was lost in the shuffle. Anyhow the daisy is not the national flower, and almost certainly it never will be.

Why should we take Italy's selection? Though assuredly not copyrighted, we ought to have sufficient pride and originality to get a flower distinctively our own. Furthermore, the farmers do not like it because it works a lot of harm by strangling timothy and clover; and what the farmers detest can never become popular. It is not a native of this country but came here in the hay imported for the horses of the Hessians who fought for hire to squelch our aspiration for independence. A better magnifying glass than has yet been invented would be required to see any patriotic association in that history.

The rules for the selection of a national flower are most exacting, but quite rightfully so. More than a quarter of a century ago delegates appointed by the governors of the states met at Asheville, North Carolina, to consider the selection of a national flower. It was resolved that it should be a native of the United States and grow wild over a greater part of its area, bloom on one or more of our national holidays, be capable of easy cultivation in any garden, should not be a weed or in any way offensive or harmful to health, should bear a flower and not be merely a foliage plant or one chiefly valued for its fruit, should lend itself readily to floral decoration, should have distinction and be conspicuous when arranged with other blossoms, should neither have been used by any other people as their emblem nor resemble such a flower in general form and should possess patriotic associations.

On the mountain slopes "the clustered laurel blooms."

The delegates did not make any recommendation. An informal vote, however, revealed their preference for the columbine or wild honeysuckle as the only plant that meets all of the requirements.

The blue columbine, state flower of Colorado, is not the wild honeysuckle which has petals shaped like cornucopias and are true horns of plenty for those visitors possessing a tongue of sufficient length to penetrate to the end of each spur. The largest of the bees can feed from the columbine's depths but the smaller ones must satisfy themselves by nibbling the pollen from the yellow anthers; occasionally, however, a bee with an extra share of resourcefulness will drill a hole into the honey pocket. The ruby-throated humming bird qualifies as the special friend of the columbine. Wearing a red tie, he consistently prefers to raid the nectar treasury of a red flower. Though this chumminess with birds and bees has never been named as a requirement for the national honor, there is something of a poetic nature attached to the blossom that pleases with its beauty and also makes itself useful by supplying food to its friends.

Frederick LeRoy Sargent, the artist, was probably the first advocate of the columbine's virtues. At the Columbian exposition in Chicago he urged its adoption partially because the flower contained the forms of five doves and therefore connoted the dove of peace. Linnaeus, the Swedish botanist, gave it long ago the scientific name of *aquilegia canadensis* because the spurs of the flower resembled the talons of the eagle. The Latin for dove and eagle is *columba* and *aquila,* respectively. Dr. Pryor, of England, bestowed the name of columbine; therefore he must have seen in the flower the images of doves. It evidently symbolizes not power alone nor peace alone but possibly the power to enforce peace.

The red and yellow dancer successfully defies good taste with its exquisite blending of these difficult colors. It may be found in every state and in all altitudes. It has never been considered a weed. Blooming as it does in May and June it heralds the approach of Mother's Day, Memorial Day and Flag Day. Perhaps the graceful, nodding blossom has been best pictured as

> "Skirting the rocks at the forest edge,
> With a running flame from ledge to ledge,
> Or swaying deeper in shadowy glooms
> With a smoldering fire in her dusky blooms
> Bronzed and molded by wind and sun,
> Maddening, gladdening every one
> With a gypsy beauty full and fine,
> A health to the crimson columbine."

A lover of this flower alleges there are just 13 species native to this country. In this connection he points out that the original states and the stripes of our flag are both 13 in number. But he may be overzealous; certainly at any moment the discovery of a new species would wreck this precarious simile.

The trailing arbutus or mayflower has patriotic associations that cannot be denied. It grows abundantly in proximity to Plymouth, Massachusetts. It constantly reminds its beholder that it was the first flower which greeted the Pilgrim Fathers after their fearful, heartbreaking winter. It therefore betokens the reward of endurance and persistence.

"The quaint blush of the arbutus in the midst of the bleak March atmosphere," Donald Grant Mitchell wrote, "will touch your heart like a hope of heaven in the midst of graves."

It is the best-loved flower in New England where the white or pink-tinted blossoms have been so often picked as to render it already comparatively rare. If it were selected as the national emblem, the sudden increase of popularity would lead to its extinction. As the fragrant beauty is not found farther west than Minnesota, it may properly be regarded as too sectional to be a true representative of the nation.

The goldenrod has a host of friends who aver it grows wild in all parts of the nation, blooms from July to October and symbolizes by its color the national wealth. With 80 species here and only two in the Old World it qualifies as distinctively American. Its botanical name, *solidago,* means *to make whole.* There is a certain sturdiness about it and a volume of bloom that endears it to most of us. Some observers see the yellow as clustered sunshine or bundled cheerfulness. The color gives it an appealing warmth which wins practically all except the calloused and hard-boiled. Personally I like this rhymed interpretation:

> "Columbia's flower, the goldenrod,
> On hill and valley grows;
> The gold is for one who earns,
> The rod is for her foes."

Those American residents who can never summer free from the pestilential hay fever are relentless enemies of the plumed plant that brightens our meadows and roadsides. Its pollen and that of the ragweed are the prime propagators of the disease; yet if one of the best authorities on this subject can be believed, the goldenrod is responsible for only 15 per cent of the cases whereas the ragweed ranks as the major offender with a count of 85 per cent. The sufferers maintain, however, that it aggravates the cases started by the ragweed. One thing is evident: the goldenrod will never be a unanimous choice.

The goldenrod has a loyal following. It leads in the number of state supporters inasmuch as it has been elected to sectional honors by Missouri, Nebraska, Iowa, Kentucky and Alabama. Four states have adopted the violet and three have declared for the rose; these two hold second and third places among state favorites.

An Experiment in Democracy—By H. T. DOBBINS

A REMARKABLE thing occurred at the election in Nebraska. Nothing like it had been recorded in the political history of that state before, and in but a very few instances has its counterpart been reported in other state elections. More than 100,000 voters crossed party lines and cast their ballots for Robert Beecher Howell, Republican, for United States Senator, and for Charles W. Bryan, Democrat, for governor.

Thousands of Republicans deserted Mr. Howell, their party nominee, because he had a record of opposition to corporate influence in politics and is a pronounced advocate of public ownership of utilities in a limited way. Thousands of Democrats deserted their party nominee for governor, Mr. Bryan, because he had exactly the same kind of a record as had Mr. Howell, upon those questions.

But the Republicans who went over to Bryan and Democrats to Howell vastly outnumbered the procession in the opposite direction, with the result that Mr. Howell was elected by more than 70,000 votes over Senator Gilbert M. Hitchcock, and Mr. Bryan by more than 50,000 over State Senator Charles H. Randall, both outstanding citizens of character and ability.

The explanation of this electoral phenomenon —70,000 majority for a Republican and 50,000 for a Democrat at the same election in a state where, outside the 1920 landslide, 10,000 to 15,000 either way is regarded as being a surprise—is a simple one. The Progressives of the state had the opportunity to vote for two men with known progressive records, and they refused to recognize the party label of either, but voted for the men.

This result was not accomplished, however, without organization and effort. The deflation of 1920 bore heavily upon the agricultural West. The farmers, as a class, believe today that they were deliberately chosen by the great financial powers, operating through the Federal Reserve System as the first victims of the deflation process. The fact is that the farmers bore the first brunt of the price decline, and from wheat at $2.20 and corn at $1.90 at the peak, prices declined until in 1921 wheat was selling at a third and corn at a tenth of those figures.

The result was that a number of the weaker banks in the state fell like a house of cards, and every other bank braced itself for a hard storm. All found themselves with loans to farmers made on a basis of war values of farm products, and with most of their assets frozen they were unable to function in any helpful way.

A regular session of the state legislature, made up almost entirely of Republicans, only four Democrats out of 133 members of the two houses, was held in 1921, and, oblivious of the gathered storm, it proceeded to increase state taxes.

The farmers rose up en masse to protest against this additional burden. They were backed by organized labor. Their leaders and spokesmen declared that both of the old parties had shown themselves incapable in the face of a situation that called for genuine appreciation of the problems of the people and for progressive action. The organization of a third party, local in scope and dealing with state questions only, was urged. The idea took like wildfire, and at Grand Island a year ago more than 500 farmers and workers from the shops and factories gathered and launched the Progressive party of Nebraska.

Within a few months, however, the Progressive party was wrecked by dissensions between the leaders and the aspiring politicians who had hitched their wagons to the new political star.

The final blow to the hopes of a third party was given when Mr. Howell and his Progressive supporters and Mr. Bryan and his group of Progressives advised that each party primary be made the battleground.

The more radical element declined to agree, and placed a ticket in the primary of the Progressive party. The less radical element matched this with a ticket of its own. At the primary election the mid-roaders lost, and the Progressive party nominee for Senator, Judge Arthur G. Wray, withdrew in favor of Mr. Howell, who had won the Republican nomination.

The Republicans had nominated for governor Charles H. Randall, who had been a member of the last legislature and who had voted for several measures denounced by the Progressives. He was a banker of considerable wealth, and while by no means a reactionary he lacked the clean-cut progressivism of his opponent.

In the Democratic primary Mr. Bryan and Mr. Hitchcock had effected a truce. In past campaigns they had been bitter opponents. Because of his opposition to Prohibition, suffrage and a number of progressive measures, Mr. Bryan and his powerful brother had denounced Senator Hitchcock as a reactionary. Mr. Hitchcock, through his influential newspaper, the Omaha *World-Herald,* had said many uncomplimentary things about the Bryans. Charles W. Bryan found himself opposed in the primaries by a dirt farmer with a Progressive legislative record, and while Senator Hitchcock did not need the Bryan support at the primary, he faced the fact that he had no hope of election in November without it.

In the Republican primary Mr. Howell found himself opposed by Congressman Jefferis, a reactionary, and Attorney-General Davis, who had a fairly satisfactory Progressive record. He won handily. The Progressive issue did not enter into the Republican contest for governor, and Mr. Randall emerged with a few hundred majority.

While both candidates kept their party regularity straight by speeches in which they supported the entire ticket upon which they were running, the result was never at any time in doubt. Both were men of known Progressive records, each pledged to a program entirely satisfactory to the Progressives of the state, and each ran almost equally well in country and city.

The Progressives of Nebraska gave a Progressive Republican candidate for state railway commissioner 80,000 majority, and elected a Democrat secretary of state by 20,000. They defeated a referred law which aimed at the destruction of the direct primary method of making nominations by 105,000 and one which required every farmer in the state to register, a device of the professional politicians to restrict his freedom to move about freely from one party primary to another, by almost as large a vote.

The Nebraska election was a successful experiment in democracy, and demonstrated that with the issues clearly drawn as between men representing definite policies, the Progressive majority found a way to register effectively and accurately its wishes.

Economic Power of Money and Credit

What Does Gold Standard Mean When, of Every $1,000 Cleared in Year, There Was Just $1.78 in U. S. Money on Hand in the 34 Banks Reporting

By PAUL G. LEWIS

A FAIR working knowledge of money may be obtained by understanding the most prominent features connected with its origin and development.

In our colonial days the Indians used as their money strings of black and white beads made from sea shells; and the black beads were worth twice as much as the white.

What began to puzzle the Indians in their trading with the early settlers of our country was the methodical and mathematical disappearance of white beads as if these had been swallowed up by some mysterious being or power.

Finally they discovered that their civilized brethren were engaged in the profitable industry of dyeing all white beads into black ones, thereby enabling them to purchase twice as much of the commodities offered for sale.

Although we are no longer dyeing beads, yet the principle of getting twice as much as we are morally and ofttimes legally entitled to has not changed one whit.

Next to be used as money were the products of the soil such as cotton, tobacco, tea, rice, and so on, mostly of a perishable nature; and thereafter warehouse receipts relating to the above were used as mediums of exchange.

Later the land of the Great Northwest Territory, as it was then called, was used as a basis upon which the colonial banks issued their notes.

Still later the Constitution of the United States provided for the use of only gold and silver coin; and finally we find that instead of such coin the government issued gold and silver certificates.

The Beads Possessed Value

IT IS very apparent that money, from the earliest period of our country down to the Constitutional days, always possessed intrinsic or natural value of some kind, or was representative of such value.

The beads, though purely ornamental, possessed a value placed upon them by the Indians for exchange purposes. Every exchange constituted a special form of barter wherein the beads performed the special function of money. It was no different when cotton, tobacco, tea, rice, and so on, were used as money. Later when warehouse receipts of the foregoing were used as money, we find a different kind or type thereof put into circulation.

The warehouse receipt, although possessing no intrinsic value, did, nevertheless, represent something of value.

In the use of a warehouse receipt as money, we had an instrument which certified to the character, quality and quantity of that special kind of property, mostly of a perishable nature, which was stored in the warehouse mentioned.

This particular form of money was far from being a convenient medium of exchange on account of the frequent necessity of checking up each time for exchange purposes, the property represented thereby, because any deterioration, damage, or loss of property, certified to in the warehouse receipt, materially affected its use as money.

The Colonial bank notes constituted another particular form of money, also based upon property, and although the property, being land, was of an imperishable nature, the value was nevertheless most uncertain and speculative, so that this particular grade of money met with little favor; and many of these notes became worth little more than 10 cents on the dollar.

The next important change with reference to money was that which was embodied in the United States Constitution.

Adequate Foundation Needed

UP TO this time the colonists had tried out everything exchangeable which could be used as money. With this wide range of experience in money, the framers of the United States Constitution made a final selection from among all different kinds of material property known to man, by the adoption of gold and silver coin.

> "No state shall . . . . make anything but gold and silver coin a tender in payment of debts."
>
> Art. 1, Sec. 10, No. 1, United States Constitution.

We have often heard it said that history repeats itself, and this statement applies most aptly to gold and silver coin.

We could hardly have expected a higher grade of money than beads which constituted ornamental property when we consider that the making thereof was left to the poor ignorant Indian, but when THE HIGHEST TYPE OF THE EDUCATED WHITE MAN who for centuries had tried out as money all kinds of material property which at all times was most essential for the sustenance of the race, FINALLY FALLS BACK AGAIN INTO THE SAME PIT by again using *ornamental property*, or gold and silver, for his money, then we had forced upon us again the same old principle of PLACING OUR MONEY UPON SOMETHING "WITHOUT" WHICH EVERY NATION COULD LIVE.

The theory that money should be based upon or be representative of something of intrinsic or natural (utility) value has been so firmly established during the centuries of constructive evolution that there is no longer any logical reason for the existence or promulgation of theories which dispense with "value" as a foundation for money, or which advocate the theory that money should be based upon a non-interest bearing indebtedness.

There is nothing in all the world used as a means which is so extensive and has so wide a range of application in its practical operation as money.

Everything movable and immovable, capable of having its inherent, utility or natural value expressed in terms of dollars and cents, comes within the broad range of the science of money.

It is now up to the economists and philosophers, with thousands of years of experience to draw from, to ascertain what really constitutes the highest value known to humanity in order that its people be provided with an adequate foundation for a medium of exchange of the highest type.

In other words, what is it without which humanity in its civilized state could not have continued to exist, but with which it has weathered all storms; and which must be the sustaining power of all time to come?

All Forms So Far Failures

EVERY civilized nation in the world has tried out every form of money based upon some kind of property, and every such form has been a failure; more particularly is this true of the present character of money.

The evolution of money had exhausted itself so far that it could not be longer based on property, when the United States Constitutional selection of gold and silver coin had been made; and for that reason we are now compelled either to find a value which is "greater" than gold and silver, or we must forever remain on the gold standard, together with the use of some silver.

In other words, we must find a better foundation for our money.

Our wise forefathers wore the knee breeches of a boy, and were of the firm opinion and belief that there would always be plenty of gold and silver metal for coinage purposes at hand and to be discovered, wherewith to discharge all financial obligations.

However, the economic necessities, which arose from the extreme shortage of gold, caused other forms of money to be invented and adopted, the outcome of which no government officials and no textwriters had anticipated.

Instead of the government exercising exclusively the function of making and issuing money, we find that today nearly everybody with a few hundred dollars to his credit in a bank ledger, with a small check book, and with a fountain pen, is issuing his own medium of exchange which today is accepted with as much welcome as gold coin was in the western coast country during bygone days.

Overwhelming Use of Checks

THE money issued by individuals as evidenced by their checks is based upon a credit for which the bank is liable in United States money, on account of some kind of a deposit received by it.

A deposit which entitles the depositor to a credit in a bank's ledger may consist of coin or their certificates, circulating notes of the government or banks, checks of all kinds, and *lastly*, but by *no means least*, the *thirty, sixty or ninety day I. O. U. notes of depositors.*

The last-named deposit is one known as "discount" which means that the bank becomes indebted to the depositor for the amount placed to his credit in the bank's ledger in exchange for the depositor's I. O. U. note.

The bank makes no distinction in giving credit to a depositor whether such deposit was United States money, or whether such deposit was individual checks, or whether such deposit was an I. O. U. (debt), for in each and every case the depositor gets his credit as long as the bank is willing to accept his deposit regardless that a deposit in United States money constitutes an ASSET whereas other deposits are liabilities, whether of other banks (as in the case of checks), or of persons, as evidenced by his I. O. U. note.

As banking is conducted today, *an I. O. U. note of a depositor when within the reserve limit, is much more desirable than a deposit of an ASSET in United States money, because the I. O. U. depositor pays interest to the bank,* and that makes banking profitable, *whereas the depositor of an asset receives interest from the bank* whenever he agrees to allow his credit to remain at the bank for six or twelve months as the case may be.

That the reader may get some tangible idea of the enormous extent to which "checks" are used instead of United States money, a reference is here made to the 1916 report of the United States Controller of the Currency wherein it will be observed that for every thousand dollars ($1,000) of exchanges which passed through the New York Clearing House from September 30, 1915 to September 30, 1916, there was just one dollar and seventy-eight cents ($1.78) in United States Money on hand in all of the 34 New York reporting banks.

Exchanges in New York Clearing House September 30, 1915, to September 30, 1916, as per report of the Controller of the Currency for the year 1916, Vol. 2, page 918	$147,180,709,461.
United States money in all 34 New York reporting banks; same report and volume, pages 658-659	$261,466,556.

That is, check exchange was $146,919,242,895 in excess of all the cash available in New York banks.

It is also of great interest to know the total deposits in all of the banks in our country, including the 12 Federal Reserve banks and those of our island possessions, as well as the amount of loans and discounts which (less interest deducted) is credited to depositors and therefore included in total deposits.

Likewise, it is of importance to know the amount of United States money in all of these banks wherewith to discharge their obligations to depositors primarily, and secondarily the obligations of these banks to their stockholders for their investments.

From the reports available this information is to be found in the 1919 report of the Controller of the Currency, Vol. 1, page 179, dated June 30, 1919, as follows:

General deposits	$33,180,744,000
Loans and discounts	27,114,262,000
Cash on hand	3,213,609,000
Liabilities to stockholders	5,577,478,000
Total liability of banks	$52,903,455,000

Although the general deposits on June 30, 1919, in all of the reporting banks of the United States and island possessions, including the 12 Federal Reserve banks, amounted to 33 billions in round numbers, yet it must be remembered that about 27 billions out of the 33 billions is not money at all but represents deposits of I. O. U. notes.

Credit 10 Times as Great

THE credit given to depositors equaled more than 10 times the amount of cash on hand in all banks mentioned, not taking into consideration the liability of banks to their stockholders which in round numbers is more than five billions.

The total liabilities of these banks amount to nearly 53 billions, so that these banks *with only about three billions in cash* would find it exceedingly difficult in troublesome times to liquidate their obligations of 50 billions in cash with nothing but bonds, mortgages, and other securities with which to do it.

At least one thing ought to be apparent—our national wealth is not in money: and most of our trouble comes from trying to make believe that it is.

The banks are drawing interest on 27 billions as represented by their loans and discount account in addition to interest and profit on investments, and yet have only three billions of cash on hand.

The economic status of our country is certainly in a seething turmoil, for

> Strong in the PRODUCTION OF RAW MATERIAL;
>
> Strong in the PRODUCTION OF ALL MERCHANTABLE COMMODITIES;
>
> Strong in the LABOR that produces; for the production, transportation and the distribution of the foregoing;
>
> BUT UNSAFELY AND ALARMINGLY WEAK IN FINANCE AND BANKING thereby making it impossible to have a GENERAL WELFARE among the people of the United States.

The reason for the existence of "credit" is that there has never been enough of the Constitutional gold and silver coin to satisfy the country's economic demands.

Brought New Kind of Money

IT WAS this extreme shortage of gold coin (national money) which compelled a birth of a new kind of money whereby each individual (amateur) could make his own by issuing his personal checks.

In short, it became necessary in order to transact our business to augment the constitutionally weak and inadequate provisions relating to money, with personal checks.

The fact that by far the greatest percentage of business is financially discharged with checks, and the further fact that only men of property-wealth are able to discount their I. O. U. notes, have made it possible to bring about and establish firmly the greatest DISSIMILARITIES wherein profit was expressed in terms of money and included in every selling price, and interest charged for every debtor's promise to pay at some future time.

The banks thrive upon the economic ills and ailments; for these, like doctors, prosper only when and where their communities are in great pain and suffering, BUT WOULD STARVE TO DEATH IN A HEALTHY PLACE.

The money problem strikes at the very life of every nation; and it therefore behooves us and other nations to look long, carefully and studiously at every phase of the science thereof; and then take steps to adopt that highest and best grade of money which during its operation would tend to bring about a GENERAL WELFARE instead of many SPECIAL WELFARES as now for special individuals.

Moctezuma—Asleep in the Sun

Mexican "'dobe" in Heart of Sonora Desert

By MARSHALL SOUTH

The plaza and church, Moctezuma.

Where the glory has departed. A street of ruined and deserted buildings.

A patio.

THE golden glory of the desert sunshine floods the somnolent silence of its dusty streets; the fierce, infrequent desert rainstorms, scouring across the mesas, beat upon the carved façade of its ancient church and refresh the grateful branches of the thirsty cottonwoods; the seasons come; the seasons pass, summer and winter, seedtime and harvest; but lulled by the cooing of her thousand doves; soothed by the whispers of her desert winds—Moctezuma sleeps on.

Less than 150 miles south of the Arizona border, where by day and night the throbbing pulse of industry and the trailing smoke clouds of giant copper smelters attest the restless activity of the *gringo,* this quaint Old-World city, steeped in the picturesque atmosphere of Moorish Spain, lies tucked away in its little corner of the Sonora desert—"the world forgetting by the world forgot."

You come upon the city suddenly. A turn of the crude and rugged road that winds and bounces its way across the stony plain and in the distance an ancient dome of weathered stone lifts suddenly above the thorny summit of a stunted mesquite clump. *"La Ciudad de Moctezuma,"* says your Mexican, extending his hand dramatically, *"La Iglesia."*

And presently, rounding several more clumps of thorny brushwood and dipping downward across the bottom of a dry, sandy *arroyo,* you are beneath the shadow of this same *Iglesia*—the massive ancient church which for close upon four centuries has stood sentinel-like in the silence of the desert, guarding the quaint squat roofs and dusty *calles* that sprawl about its base.

Moctezuma lies in a wide, dry valley, sprinkled with mesquite trees and shimmering with the hazy undulations of the heat waves that play across the dry and dusty earth. Flanking it in the distance to east and west rise low barren mountain ranges, a play of bewildering brown and purple shadows and within whose canyons and caverns the bear and the dreaded *tigre* still keep their haunts.

The river bed beside which the city stands has, in common with most of the streams of Northern Mexico, but little water in it, save only during the brief *estacion de aguas* when on occasion it becomes a raging torrent whose brown flood pours to unite with the headwaters of the Yaqui—river of ominous repute.

Great clumps of trees dot the windings of the river channel and line the banks. The graceful heads of cottonwoods waving high above the greenery of lower vegetation, with here and there an ancient date palm thrusting upward its tall and feathery crest—for here the elevation of the country is much lower than the high Arizona tablelands to the north and in the dry sub-tropic climate the palms and oranges planted by the Spanish *padres* flourish in unchecked luxuriance.

For, though it be not always apparent on the surface, there is water here. Within the cool, heavily walled *patios* of Moctezuma's houses the old stone-faced wells open their cavernous depths, cool and inviting, toward the clear and limpid waters of the lower strata, and on the rich river bottoms the vivid green splashes of tiny fields of corn and garden stuff attest the fertility that follows the union of water and soil.

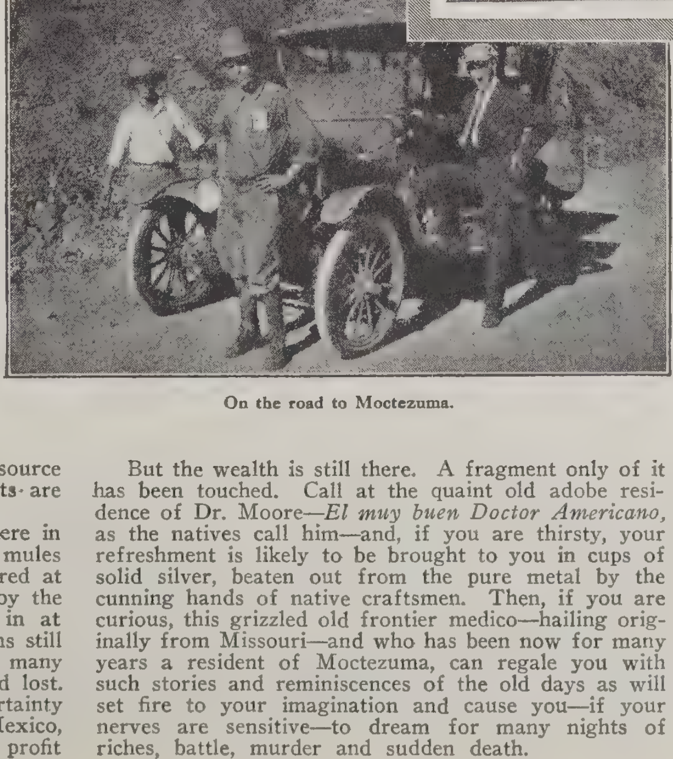
But though the soil is rich and the water is within reach it is upon mining, not upon agriculture, that the glory of Moctezuma has arisen—and decayed.

The surrounding country is rich in minerals. The mountains bulge with silver and many another metal, the lure of which, acting as a magnet, drew hither the old Spaniards and was responsible for the founding of Moctezuma, the proud and aristocratic gem of the northern desert.

But Moctezuma has fallen upon evil days. Silver declines, political upheavals, revolutions, all have laid their heavy hands upon the source of her greatness and today her once busy streets are deserted and her glory has departed.

Today, around the great bare dusty plaza where in the palmy days of old as many as 1,800 pack mules laden with ore from the mines have been tethered at one time, the same pack mules now come but by the half-dozen, by threes and by twos; straggling in at uncertain intervals and the nature of their burdens still more uncertain. Most of the mines are closed; many are ruined and destroyed; some are forgotten and lost. In a turmoil of upheaval, revolution and uncertainty such as the last two decades have brought upon Mexico, mining is a hazardous business and with but little profit attendant upon the hazard.

Interior of the ancient church of Moctezuma, almost four centuries old.



On the road to Moctezuma.

But the wealth is still there. A fragment only of it has been touched. Call at the quaint old adobe residence of Dr. Moore—*El muy buen Doctor Americano,* as the natives call him—and, if you are thirsty, your refreshment is likely to be brought to you in cups of solid silver, beaten out from the pure metal by the cunning hands of native craftsmen. Then, if you are curious, this grizzled old frontier medico—hailing originally from Missouri—and who has been now for many years a resident of Moctezuma, can regale you with such stories and reminiscences of the old days as will set fire to your imagination and cause you—if your nerves are sensitive—to dream for many nights of riches, battle, murder and sudden death.

For the walls of the old church have looked down upon many things. Wrapped in its mantle of desert sunshine and the stillness of moonlit nights the city of Moctezuma drowses on, but many a fierce turmoil and eddy has torn the peaceful current of its stream of existence—only to be blotted out again and forgotten in the sleepy spirit of *manana.*

The dreamy stillness has not always been unbroken. Rifle fire has crackled vengefully along these dusty streets and the faces of the old buildings have been scoured and shattered by storms of flying bullets. The handsome equipages of Mexican mine and cattle barons have passed majestically beneath the shadow of those crumbling old walls and many a dark-eyed *senorita* of wealth and position has been courted by a romantic Romeo—"playing the bear"—as is the Mexican saying—before her barred window in the moonlight.

The sinister crack of the rifles of execution squads have echoed through these quiet streets—if you are morbidly inclined you may still see the splintered door and the bullet holes in the adobe wall which mark the spot of the recent execution of a Federal judge and his private secretary—but these sounds, together with the clattering hoofs of galloping revolutionary cavalry, have died away and been swallowed in the silence. Moctezuma dreams on.

The glory of Moctezuma has departed but she still dreams hopefully of the day when her vanished prosperity shall return. Sooner or later will come the railroad. It would have come ere now but for the blighting hand of the revolution. The roadbed had already been graded for many miles to the southward of Nacozari—the present rail terminus—when political conditions suspended the work. Much of the grading will have to be done all over again but eventually it will be done. Eventually, some time in the not far-distant future, the steel rails will come creeping southward to unite with the Mexican system at Tonichi and giving access to the West Coast through connections with Guaymas, Topolobampo and Mazatlan. And when this time comes, so say the optimists, Moctezuma will once more return unto her own. The mines will be reopened. The refugees who have fled will return. Their palatial Moorish-Spanish residences, many of which are now ruined and deserted, will be rebuilt in as fine a style as ever. The long streets of crumbling adobe houses of the peons will be repaired and retenanted. Industry will once more raise its head and commerce will be resumed. Yes, of a surety, *"Muy pronto, Senor. Pasado Manana,* maybe if *Dios* so wills it, Moctezuma will return again to her prosperity."

Moctezuma's residents are slowly learning the lesson of rapid transit and efficiency. The Ford car is displacing the sure-footed mule, even on the rugged and rough trails which lead to Moctezuma's outlying mines.

Meanwhile, Moctezuma dreams on. The desert moon rises and floods with silvery light her deserted streets and among the inky black shadows cast by half-ruined walls the wandering burros, nosing in the dust for a scant meal of stray corn shucks, disturb with the soft shuffle of their dragging hoofs the solemn silence of the desert night. No other sound disturbs the stillness. Wrapped in her dreams, and peopled by the ghosts of her past, Moctezuma sleeps on.

Everyday Doings at the Animal Fair

National Zoological Park, Champion in Raising Baby Wild Beasts

By GEORGE H. DACY

This trio of baby bears affords amusement to the zoo visitors when they frolic and cut capers.

HOW would you like to tackle the job of doctoring a sick and ferocious tiger? It was a nice, full-grown tiger, big as a Shetland pony and as vicious as these jungle beasts are before they become accustomed to the restraint of steel cages. The tiger was suffering with acute indigestion. He was in such agony that he had fallen to the floor of his cage. The head keeper, a famous animal expert, knew that if he entered the cage he would be torn to pieces. What could he resort to to introduce a dose of medicine into the tiger's mouth? Finally, he hit on the scheme of getting on top of the cage to tickle the animal's nose with the long lash of a whip. The tiger—greatly irritated—snapped repeatedly at the lash. The keeper substituted a stream of castor oil for the lash. The tiger snapped at the descending oil and before he knew it he had swallowed enough to remedy his ailment.

This resourceful head keeper was William H. Blackburn, of the National Zoological Park, Washington. D. C. He is an expert animal raiser and trainer. He cut his eyeteeth in the wild-beast breaking business years ago with a famous circus and for 40 years has devoted all his time and attention to the study of jungle beasts, their haunts, habits, likes and dislikes. For three decades Mr. Blackburn has been in charge of the wild animals at Uncle Sam's zoo in Rock Creek Park. To him credit is owing for the success of this national project and its championship honors as the outstanding zoological park in raising and developing baby wild beasts. The national capital zoo has had greater success in raising its young than any like institution in the country.

If you revel in true tales of real adventure, it would do your heart good to sit and talk with Mr. Blackburn for an hour or so. He has faced death and braved danger as frequently as most of us get a haircut. Once he was in the midst of an elephant stampede, following the collapse of a circus tent in a cyclone. A baby elephant ran far and fast; finally he stopped at the doors of a large iron foundry. It looked warm and inviting. The trespassing beast ambled in and caused a stampede among the laborers. Soon the elephant had the place all to himself. After he spent the night stumbling into foundry fires and getting badly burned, he was very docile and anxious to be led away by his keeper when that worthy appeared next morning.

Thirty-one years ago Mr. Blackburn escorted two full-grown elephants out to Rock Creek Park from the Smithsonian Institution and chained them to large trees. "I staked the beasts out fore and aft to make sure that they didn't break loose and run amuck over the fashionable residence section adjoining the park. It was five months before I obtained government funds to construct sheds and stables for the beasts, and, in the meantime, I had assembled five elks, five buffaloes, a half-dozen deer, as many bears and a few other animals at the park to keep the elephants company," said Mr. Blackburn. "Originally my herds contained a predominance of male animals and it was some years before I was able to reverse conditions by raising many females. The second winter I made arrangements with Forepaugh's circus to winter 75 animals for them. This filled all my available cages and pens and attracted great interest. People came from all sections to visit the wild animals in Rock Creek Park. Our present National Zoological Park is the logical outgrowth of these pioneering efforts to establish a creditable wild animal station in Washington."

The infant mortality record at the Washington Zoological Park is small indeed. For example, during the 1922 season all but two of the 137 youngsters that were born in the cages and dens of the Federal zoo lived and prospered. It was the fault of a neglectful mother that two of the three lion cubs died. Usually the first two or three litters which the young lioness bears are not easily raised as the young mother has not yet learned how to care for her young. It so happened that the cubs in question were the first borne by this particular lioness.

"What is the most difficult wild animal to raise?" I inquired of Mr. Blackburn.

"That is hard to say," he replied. "Many tigers and lionesses neglect their babies. Pumas and leopards frequently eat their young. Recently, I have had trouble raising young peafowls, as there are some wild raccoons and possums in this large park which prey on the peafowls. I had to take four tiger cubs from their mother about a year ago and raise the youngsters by hand because their mother was beginning to get tired of them and would cuff and pummel them about. I raised the baby tigers on ground pigeon's meat. They did well and today are a fine quartet."

"What kind of a mother is that hippopotamus?" I asked, pointing to an enormous hippo from East Africa that weighed 4,800 pounds.

"A dandy," responded Mr. Blackburn. "Since 1917, she has raised three fine youngsters. One of them is now in the St. Louis Zoo in Forest Park. Another is with a professional circus. The third is here. We have to run the babies with their mothers until it is time to dispose of them as we have not enough extra pens to separate them sooner. The baby hippo soon learns to nibble at hay and the grain ration including ground oats, bran and chopped vegetables. It is not long before the youngster is eating his or her fill of these staples."

Mr. Blackburn has raised many wild animals—orphans or waifs that were abandoned by their mothers—on the bottle. It only takes a day or so to introduce the hungry youngsters to the proper combination on the nursing bottle. Thereafter, the little fellows guzzle cow's milk with keen relish and wax fat and healthy in the doing. Camels weigh about 30 pounds at birth. They usually are weaned from the bottle system of feeding at 10 to 12 months. At that time they are accustomed to grass, hay and grain.

For some time, Mr. Blackburn had been admiring a large, healthy boa constrictor that was one of the finest snakes at the national zoo. One day he walked by the glass case where this snake was quartered. He stopped in amazement and for the time being thought he was "seeing snakes." In the case were 62 little boa constrictors which the stork had brought the previous night. Now, if you think it is easy to get rid of enough boa constrictors to terrorize the leading cities of the Atlantic seaboard, just tackle the assignment. By art and artifice, Mr. Blackburn finally gave away, traded and sold his curious collection of baby "boas" and when the family was finally dispersed, this head keeper solemnly affirmed that "all the king's horses and all the king's men would never get him into the snake business again."

Elephant cows, as a rule, are good mothers. Their young soon learn to eat hay, grass, bran, apples and bread and milk. They are particularly fond of bread and milk, the plum pudding of the elephant family. Even under jungle conditions, infant elephants are very friendly. In case of a stampede in which some of the youngsters are left behind, it is easy to capture and train them to follow their masters about like dogs. Elephants mature slowly and do not attain their full growth until they are about 25 years old. An elephant is not considered old until the animal has passed the half-century mark. Many attain the age of 80 years or more. They are unlike other wild beasts in developing as most of the inhabitants of the jungle make their greatest growth between the ages of one and two years.

The animal keepers are invariably up against a knotty problem when any of their charges get sick and require doctoring. The wild beasts are most suspicious of any strange smell or odor. Hence it is very difficult to put medicine in their food and get the animals to consume it. When zoo inmates show signs of illness, the usual practice is to give them no food or water for a day. The animals that cannot be handled, such as lions, tigers, pumas, leopards and the like, are given large doses of epsom salts in water. The animals are so thirsty that they will gulp down the medicated water after their fast. The keepers also pour castor oil over the noses, heads and fore feet of the sick animals. The beasts will lick off this material and in that way get much of it into their stomachs.

Mr. Blackburn tells of a nearly bald tiger which the proprietor of a leading circus once gave him. The beast was troubled with mange. Placing the tiger in a cage, Mr. Blackburn mixed up a novel bath for the tiger. He climbed to the top of the cage and showered the beast with a mixture of sweet oil and sulphur. He repeated the applications until the animal was cured and became as sleek and glossy as a grizzly bear. This tiger lived to be 30 years old and was one of the most admired animals in the Washington Zoological Park.

Animals like camels and llamas, which can be handled by a keeper, can be drenched from a bottle when it is necessary to give them medicine. For the most part, buffaloes and deer have to be handled like timid and excitable domestic live stock when they need the services of the doctor. Mr. Blackburn has had interesting experiences in mending the broken bones of some of his wild pets. On many occasions, he has set the broken bones of deer and buffaloes in plaster of Paris casts so that the injury again knitted and the animals finally gained full use of their legs. He has also played dentist whenever necessity demanded. One of his recent exploits was to pull an ailing tooth almost as large as a potato from the mouth of his best hippopotamus.

A quartet of baby tigers and one of their playfellows. The young tigers are docile as dogs and frolicsome as kittens at this age.

Many llamas have been raised at the National Zoological Park.

Introducing Mrs. "Hippo," who weighs 4,800 pounds, has raised three fine youngsters since 1917 and is one of the prize matrons of the Washington Zoo.

Mr. Blackburn, head keeper at the National Zoological Park, and one of the young, little old men that he is raising.

"Truth Crushed to Earth"

Concluded from page 3

"That is all. I will see you on the day of the march which will be the day after tomorrow."

That on the morning of October 25, 1918, after the company had been dismissed on the way back to my quarters, Captain Rosenbluth stopped me and asked me if I had forgotten what he told me the night before; that I said: "No"; that he then asked me if I had a gun, and I told him that I had not; that he then said: "You want to borrow one then, and get ammunition, too. The person from whom you borrow the gun must not be told what you want it for, and when you get the ammunition, put it in your pocket, and when the company falls in, you know where your place in line is, and after we get on the march, I think we will have some advance guard problems, and I will talk this over with you when we have these problems. That is all for now"; that we then started on the march, and had proceeded about two or three miles from the camp and started doing advance guard problems. In the meantime, Major Cronkhite showed up and apparently assumed command; that I then asked Captain Rosenbluth if it would be all right to go with the major now, and he said: "Go ahead"; which I did; that while engaged in advance guard problems, Captain Rosenbluth said to me: "If anything comes up after the shooting, you explain that he was engaged in target practice, and that he shot himself accidentally. If they ask how it happened, you say that the major was holding his gun barrel up a little, inclined to the rear, and that his gun twisted in his hand, and as he went to catch it, he accidentally shot himself"; that the captain then told me to go with the major and stay with him; that we came to a place where a trail led off to the right of the road, and the company was assembled, and the major and captain went in front of the company, and I was about six paces behind both of them, and the head of the column was about 50 yards behind me; that we had proceeded to a point about four miles from camp by this time, and while going down a slope, Captain Rosenbluth dropped back and told me to go back and halt the company. In the meantime Major Cronkhite kept on walking until he arrived at this little open space behind some bushes, and stood there with his back to the road; that I met Captain Rosenbluth as I was on my way back to join the major and the captain; that the captain told me to go get him now; that I then joined the major in this open space, and when about two feet behind him, I loaded my revolver with the three shells; that I fired one shot into the open field, and as the major was turning around in my direction, I fired my second shot at the major, hitting him in the right breast; that about this time I heard another shot from behind where I was standing; that Captain Rosenbluth came rushing upon the scene and picked the major up and dragged his body so that it lay in a position parallel with the road; that Captain Rosenbluth then drew his gun from his holster, the flap of which was unbuttoned, and shot a hole through a tobacco can and said: "Do not forget about this being target practice, and that the major shot himself accidentally, and if any questions are asked about this, let me do the talking, and you keep still"; that I did this; that Captain Rosenbluth then looked over Major Cronkhite and said: "I think he is dead"; that he then called for Dr. Seaburg and about 10 minutes had elapsed between this time and when the major was shot; . . . . that I accompanied the body to headquarters in the ambulance and then to the hospital, where I was ordered by the officer of the day to make a statement concerning the shooting; that Captain Rosenbluth and Dr. Seaburg were also requested to write out statements; that these statements were each written in a separate room and handed to the officer of the day after they had been written; that before leaving the hospital, Captain Rosenbluth stopped me on the way out after I had made the statement, and told me to meet him the night after, the following night, after tattoo, in the same place where I had met him on several occasions previous to the shooting; that on this night I met Captain Rosenbluth as requested; that he told me not to forget about explaining the shooting as the result of target practice, and that the major shot himself accidentally, and for me not to fear, as everything would be all right; that I later went before the board of inquiry when it met, and testified the way I had been told by Captain Rosenbluth.

(Signed) ROLLAND R. POTHIER.

Subscribed and sworn to before me this 25th day of March, A. D., 1921.

THOMAS J. CALLAGHAN,
Special Agent in charge
JAMES J. LEE,
Special Agent.

Whether this sworn confession be true or false can never be determined until testimony is given concerning it before a judge and jury, directed by a prosecutor and counsel for the defense. That is Anglo-Saxon law. Unfortunately, there is only one race in the country that refuses to submit to it.

In this case two facts stand out like white patches on a black curtain. They are the work of stealthy hands, of men hidden in dim backgrounds.

The uniform of Major Cronkhite was burned, thus destroying the evidence of powder marks and the direction of the shot.

The second fact is that, after the confession, and the arrest of the accused men, when it was seen that their testimony hinged upon the proximity of the scene of the shooting to the gatepost of the Schuffert farm, incendiary fires were started to destroy the fences, posts and buildings.

In describing the third phase of the Rosenbluth-Cronkhite case, details will be given of the organized assault upon the law forces of the United States Government. Agents of the Department of Justice are hated, feared and reviled—by wrongdoers. Those familiar with the work of these men, know how generally they are actuated by a stern sense of responsibility.

During the years in which the government agents were working on this singular case, they came upon many strange discoveries, which have not yet been brought to light. One of the most significant "finds" was the existence of a secret code—one designed for use in obtaining trade advantages and concessions in countries with which trade at that time was prohibited by the United States.

This code, whose numbers run from one to two hundred and ten, is in part as follows:

173. Aside from the general contract . . . .
174. Part of our general contract . . . .
175. Situation now justifies our showing our hand, and I so recommend.
176. Proposition re liquidating foreign claims and goods in warehouses here excellent.
177. Proposition re liquidating foreign claims and goods in warehouses here is still being negotiated.
178. Proposition re liquidating foreign claims and goods in warehouses here is dead.
179. I am to be chairman of commission to arrange settlement of foreign goods now here. Others on commission are . . . .
180. Also including all other claims of foreigners.
181. You are to be general agent America, duty to bring in every person with such claims.
186. Soft coal mine and general character coal mining rights in . . . .
187. Private owners organizing to come in according to our plans.
189. Railroad to mines to be constructed or reconstructed within . . . . months.
190. Railroad to be entirely reconstructed and equipped.
201. Secured concession with full rights and guaranties, according to principles laid down by us for years.
202. Secured concession with full rights and with the following guaranties . . . .
203. Secured concession with full rights and with the following guaranties and securities in properties and otherwise.
204. Secured concession with the following principal conditions . . . .
207. Minimum amount of money to be deposited . . . .

The method of operating a code such as this, is by having alphabetical characters representing the different number groups. If for instance 179 were represented by the letter W, 176 by the letter H, 175 by the letter S and 201 by the letter O, the following message sent by cable or wireless:

SHOW, Braun, Jonas, Rabinovitch

would read, when decoded:

> Situation now justifies our showing our hand, and I so recommend. Proposition re liquidating foreign claims and goods in warehouses here excellent. Secured concession with full rights and guaranties, according to principles laid down by us for years. I am to be chairman of commission to arrange settlement foreign goods now here. Others on commission are Braun, Jonas, Rabinovitch.

The question that now arises in the Rosenbluth-Cronkhite case, is what is the meaning of

The studied assault that is being made upon the law forces of the government;

The secret destruction of evidence, the smothering of testimony;

The deadly fear shown of permitting witnesses to plead to a Federal grand jury indictment;

The sudden appearance of hordes of lawyers to defend one of them;

Their threats to impeach the Attorney-General of the United States if he insists on proceeding with the case?

These facts incline one to the belief that this affair is more involved than may appear on the surface, that there may be "men higher up"—men of wealth and importance—concerned in enterprises which they are determined must not see the light of day.

The third chapter of the Cronkhite-Rosenbluth mystery story will appear in an early issue of THE DEARBORN INDEPENDENT.

Variations in the High Tariff Shibboleth

Consistency of Argument Not the Jewel in Protection Claims

By JOSEPH DANA MILLER

WE HAVE heard a great deal of a "scientific tariff." But we have never had such a thing. A scientific tariff would be one with rates of duty based entirely upon differences of labor costs—never so great as is assumed—here and abroad. These could be ascertained only by long studies in comparison. To make it really scientific, rates of duty should vary from month to month, almost from day to day, to meet wage fluctuations. How this is to be done has not yet been discovered, so to anticipate the advent of a really scientific tariff is a vain hope.

Like the poor, the tariff we always have with us. And one protective tariff does not differ greatly from another. Always they are the result of compromise between interests clamoring for favors; the stronger the interests, the greater the concessions they are enabled to win from the tariff-makers.

From the log-rolling that takes place, the schedules emerge as top-heavy monstrosities, with their combinations of ad valorem and specific duties which make it almost impossible for the average man to determine just what is the actual rate, and with all the absurdities and complexities inseparable from the practical administration at the ports of entry.

But while tariffs have not changed, either in their incidence or origin, what have changed are the arguments in support of protection. It will be of interest to review these, and show their kaleidoscopic character. The advocates of high protection have agreed that you cannot fool all the people all the time with the same arguments, but you can do this very successfully by varying the "reasons" from time to time as they become "shop worn."

The "High-wage" Cry

"WE NEED A TARIFF BECAUSE OF OUR HIGHER WAGES HERE." It will surprise those who are not close students of the shifting tariff argument that Alexander Hamilton and Henry Clay did not advocate the tariff as a means of raising American wages. On the contrary, their contention was that wages here were too high. Their idea of a tariff was to encourage the investment by foreign capitalists in infant industries here, and thus promote the immigration of cheaper labor from foreign countries. Hamilton urged this argument with perfect candor, though it is to be observed that he regarded high tariffs as temporary expedients and not as permanent policies.

But Henry Clay was more frank. He said: "I am aware that the public domain constitutes an impediment, in the opinion of many, by its tendency to prevent the reduction of the wages of labor."

But the most incredible thing of all is that Clay urged that the system of protection actually increased poverty and the number of great fortunes, and that this condition had its advantages. We quote from what he said on March 30, 1824:

"As to the poor rates, the theme of so much reproach without England and so much regret within it among her speculative writers, the system was no less a proof of her unbounded wealth than her pauperism. What other nation can dispense, in the form of requested charity, the enormous sum, I believe, of 10 or 12 million sterling? The number of British paupers was the result of pressing the principle of population to its utmost limits, by her protecting policy, in the creation of wealth, and in placing the rest of the world under tribute to her industry. Doubtless the condition of England would be better without paupers if in other respects it remained the same. But in her actual circumstances, the poor system has the salutary effect of an equalizing corrective of the tendency to the concentration of riches, produced by the genius of her political institutions, and her prohibitory system."

Less than a generation after these words were spoken Great Britain had abolished every vestige of her protective tariff!

From Days of 1860 to 1900

"WE NEED A TARIFF TO PRESERVE OUR HIGHER WAGES." This was an admission, at all events, that the somewhat higher wages prevailing in this country were due to other causes than the tariff. Note that the argument had shifted. It was used with effect from 1860 to the days of McKinley. Why wages here were higher as compared with wages abroad, was not indicated. The true cause was pointed out by Clay in the paragraph quoted, in which he refers to the great public domain which for a long period furnished an outlet for labor and tended to keep up wages. This explanation was advanced by Adam Smith writing before we were a confederation, and, therefore, before any tariff here could have existed save the one for the protection of British industries against which we revolted. How wages are determined, the fact that wages are always higher in a new country, and that tariffs have little or no relation to the causes governing the compensation of the workers, were ignored even if they were understood by the advocates of high protection.

"PROTECTIVE TARIFFS CREATE HIGHER WAGES." Again the argument had shifted. High wages, instead of being a disadvantage, as Clay had argued, were now to be preserved at all hazards. Observe that this argument inferentially denies the validity of the former plea. It counted nothing to the advocates of protection that immigration was unrestricted, that there was no bar to the incoming "pauper labor" of Europe, that wages in the more highly protected industries were the lowest paid, and that a theory which relied upon the manufacturers paying higher wages voluntarily out of their increased profits was not likely to work out in practice. It was demonstrable that high wages were not due to protective tariffs. Protectionists, however, pointed to Great Britain as an awful example of free trade. But wages were as much higher in free-trade England over those in protectionist Germany or France as they were higher in protectionist America and over free-trade England. So the argument had several loopholes—in fact, was much like a sieve. It needed to be strengthened by several other arguments, such as

"MONEY PAID FOR GOODS HERE REMAINS IN THE COUNTRY." This contention has the support of Adam Smith, who in a moment of inadvertence spoke of domestic trade as having the advantage of being an exchange of two capitals within the country, and, therefore, more profitable than an exchange of a domestic for an imported commodity.

The subtlety of this fallacy offers difficulties to the average mind, of which protection advocates were quick to take advantage. Yet obviously what is exported is the excess production of a commodity after the domestic demand is supplied, in exchange for something else which is in greater demand. Obviously, too, this serves the purpose of greater satisfaction to the people, and all exchange in the absence of artificial interference takes this course normally because it does serve the larger satisfaction. International trade is like domestic trade, and is engaged in only because it conduces to the greater satisfaction of buyer and seller. The talk of exchange of two capitals within a country as being more profitable than foreign trade is the sheerest form of concealed nonsense, even if it does have the support of the great name of Adam Smith.

"BRITISH GOLD IS SENT HERE TO DESTROY OUR PROTECTIVE TARIFF." This was a favorite argument in the eighties. There was an organization in England composed of a few hundred members, known as the Cobden Club, and named after Richard Cobden, the eminent Englishman who was a devoted friend of the United States when we needed friends. They were free traders, and they were supposed to be vastly interested in the result of American elections—why, no one ever satisfactorily explained. But the Cobden Club and British gold were long a convenient bugaboo which had its influence upon Irish-American voters and served its purpose for quite a period until abandoned for its sheer inanity.

"PROTECTION IS THE AMERICAN SYSTEM." This was for many years an attractive shibboleth. In view of the fact that it was as old as England, which had protection down to 1846, as old as Spain, where the protective system had been so effectively applied that even the export of gold was forbidden, it was something of a tax on the credulity of the American voter to call protection the "American system." But this argument served for a while until it, too, was abandoned. Mr. McCumber does speak of his brand of tariff as an "All-American tariff," thus recalling the old phrase. The habit of substituting phrases for thought, which Walter Lippmann calls "mental stereotypes," is to be noted in the tariff argument at all times.

"PROTECTION MAINTAINS THE FAVORABLE BALANCE OF TRADE." The balance of trade is the *pons asinorum* of political economy, and offers difficulties not easily resolvable. Under the terms of this fallacy it is assumed that any excess of exports over imports shows a favorable balance, and is, therefore, a good thing for the country. It is remarkable how many acute minds fell under this delusion. It was tacitly assumed that this "favorable balance" was paid by the debtor nation in money or gold. But even this amount is received not as money but as bullion. The material of which this is composed is assayed, and the bullion value, not the money value, is credited. So that even ultimate balances of trade are settled in commodities.

But if after all accounts are settled it can be shown that we have such a so-called "favorable balance," or an excess of exports over imports, it must follow that we are giving something for nothing, which, of course, would show that we are that much poorer. This argument of a "favorable balance" has been relegated to the discards. It belongs to another era.

And so the argument has shifted. We have got a long way from the argument of Henry C. Carey (sometimes known as the father of American protection), who wished that the Atlantic Ocean had been an unnavigable sea of fire, thus fulfilling the ideal of the high tariff advocates of an earlier day. We have traveled a long way from the actual protection practice when British custom officials thrust sticks covered with tar into imported firkins of butter to protect the domestic dairy interests!

They're Not Dismayed, Though

WE HEAR no longer the plea that "the foreigner pays the tax." If that were so there would be no need of any further argument. It would then be good public policy, apart from possible ethical considerations, to levy the entire expense of government on the foreigner. But nobody believes that any longer. The "infant industry" argument has been abandoned, though it is occasionally heard when protectionist Congressmen talk of the dye industry. Nor do we hear in these days much of the "home market" argument, the need of establishing the factory side by side with the farm. The latter argument lost its force when the growing agricultural industries moved further west and away from the factories.

But the high protectionists are undismayed. The new argument is that depreciated currencies abroad and high exchange rates make it possible for foreigners to undersell us in the domestic markets. But, of course, the same discrepancy in exchange rates would continue under the McCumber Tariff. As long as we were a debtor nation some of the reasons for a high tariff were at least plausible. But now that we are a creditor nation, with foreigners owing us billions of dollars, pleas for a high tariff seem fantastic. For they cannot pay us in gold; we do not want their gold: we have enough of it already, and more of it would invite disaster. We must take goods in payment, and it is now proposed to make this payment doubly difficult by the erection of higher barriers against goods coming in. This policy is, practically, to make a present to the debtor countries of what is owing us. It is protection run mad.

Things in the Making—Needles

THE use of the needle dates back to the dim ages. Historians tell us that in the remnants of the Stone Age, there have been found stone needles, with the hole in the opposite end from the point. The earliest needles, however, did not have holes in them, but were used like awls to make holes through which the thread was drawn or pushed. In the reindeer caves of France, bone needles with eyes in them have been discovered.

Steel needles are believed to have been first used by the Chinese.

In the early part of the eighteenth century metal-eyed needles were made with a stamping machine, but it was not until some 50 years later that they were made entirely by machine.

The ordinary sewing needle is made of soft steel wire, which is first cut into lengths of eight feet. The wire is coiled in such a manner that there are exactly 100 pieces in each half of the coil when cut.

These bundles of 100 wires are then cut again to the length of two needles. The wire through the coiling process is somewhat curved, and must be made exactly straight. This is done by making the short lengths of wire into bundles and placing them in two iron rings, which hold them loosely together. Now they are softened by heat and are put upon an iron plate, and by means of a curved bar, termed a smooth file, rolled back and forth until they are perfectly straight. Both ends of the wire are now pointed, on a grindstone.

By means of a die and counterdie, two grooves are stamped on each side of the wire, which is now pierced under a press with two holes, which form the eyes. The needles are now cut in two. They are still in the rough and have to be polished and tempered, and their heads ground into shape.

All the processes which a needle must pass through until it has reached its finished state, are now done mechanically, and an enormous quantity can be turned out in a day. Just where all the needles go has been a problem, as many millions of them are manufactured and sold every year.

Needles for use in machines, such as the ordinary sewing machine, and for coarser work, are made by a process similar to that of the hand sewing needle. A special machine, which is a marvel of mechanical art, is used for their manufacture. Charles R. Gibson, in his account of the automatic needle maker, says:

"We find great reels of steel wire from which the sewing machine needles are to be made. The wire is fed into the machine which straightens it and cuts off one inch at a time, while a little metal arm with two fingers catches the little bits and places them in a miniature rolling mill. The one-inch wire is rolled out to about one and a half inches, leaving at one end a small shank of the original thickness of the wire.

"The next process is to cut a groove for the thread on both sides of the needle, so the little rolled pieces are handed over in bulk to the grooving machine. This machine feeds the pieces forward, one at a time, toward a little arm, which closes its two fingers upon the shank end of the needle and lifts it over to a pair of cutters. While these cutters are making the groove, the little arm has returned to bring a second needle, and while it is doing so a second pair of fingers takes hold of the first piece and lifts it out of the cutters, placing it upon a sloping tray, and releasing its fingers so that the needle rolls down into a collecting box.

"It still remains to pierce the little eye in the groove near the point. The needles are fed along by a spiral screw, so that they lie side by side at a little distance from each other. The first difficulty is that the machine must not merely pierce a hole in the needle, but this eye must be through from one groove to the other. The needle is caught by a pair of fingers, which turn it around, so that it lies with the grooves in their proper position. A second pair of fingers places the needle absolutely straight, so that the hole is pierced exactly where it is required. It is worth while to take a look at a sewing machine needle through a magnifying glass. It is remarkable how regular and well shaped the eye and the grooves are made."

Einstein and the Nobel Premium

BY THE provisions of the will of Alfred B. Nobel, the Swedish oil magnate, who died December 10, 1896, a fund of 1,750,000 pounds sterling was placed under the control of the Nobel Foundation Directorate. The will provided that the interest which accrued from this fund should be devoted to premiums given in recognition of exceptionally meritorious achievements in science, literature, and in the furthering of the cause of universal peace. The Nobel Foundation Directorate is composed of five members. The King of Sweden appoints the president of the directorate.

The intent of Nobel in creating this foundation was of the highest altruistic order. Intellectual achievement was raised to a type of dignity which could be appraised by those who estimate human values only in monetary terms. The recipients of the premiums acquire independence which permits them to pursue their work unhampered by the burdens imposed by the struggle for existence.

A great responsibility rests upon the Nobel Foundation Directorate. In the past this responsibility has been met with calm deliberation and in most cases with eminently fair decisions. The record of the directorate is not beyond reproach, however, as the sad case of Ibsen bears irrefutable testimony. It has been definitely charged, and the allegation is undoubtedly true, that politics guided the award of the Nobel premium to the Norwegian author Bjornstjerne Bjornson in preference to that great Norwegian master of the drama, Henrik Ibsen, whose dramatic genius has not been equaled since Shakespeare. Bjornson was an able writer but he was also a noteworthy political figure. He was given the premium and the great master Ibsen died without receiving the well-earned award. This breach of faith of the directorate with the intent of the donor of the foundation caused vigorous protest at the time and should have served as a warning against similar flagrant departures from duty in the future.

Recently the Nobel Foundation Directorate awarded the Nobel premium for distinguished achievement in physical science to Albert Einstein. Uninformed and uncritical opinion will, undoubtedly, concur with the directorate in this choice. Biased opinion, created by world-wide propaganda, will heartily agree with the directorate in its decision. In this instance, however, the directorate has deliberately conferred a unique distinction and set its seal of approval upon a man who has been definitely and publicly charged with plagiarism through the medium of the international press and in such scientific journals as still retain their freedom of expression.

It may be thought that the award to Einstein was based upon ignorance of the actually involved facts and that the directorate may be exonerated on the plea of lack of information. It must be admitted, however, that in this case ignorance of facts should not and cannot be accepted as a defense of the award. The plea of ignorance cannot be allowed because of the all-important reason that the directorate's attention had been definitely called both to the charges made against Einstein and also to the unbiased appraisal of his alleged achievements.

One of Sweden's most eminent scientists, Professor O. E. Westin, published in the well-known Stockholm paper, *Nya Dagligt Allehanda* (October 22, 1922), an article entitled: "Einstein, the Coming Nobel Prize Winner.—Can Einstein justly be regarded as a scientist of note?—And has he shown himself honest in his researches?" This communication appeared in *Nya Dagligt Allehanda* some weeks before the prize was awarded to Einstein.

DR. O. E. WESTIN,

Famous Swedish savant, formerly Professor of Mechanics at the Royal Technical College of Stockholm, who warned the Nobel Foundation Directorate against awarding a prize to Einstein.

Dr. O. E. Westin has written extensively on the fundamental principles of mechanics and physics. Among his most noteworthy contributions are: "Reality and Abstractions in Theoretical Mechanics," "Einstein's Theory of Relativity," "Mechanical Questions." Professor Westin writes English, German and Swedish with equal ease. For many years Dr. Westin was professor of mechanics at the Royal Technical College of Stockholm. He has now retired and resides at Amal, Sweden, where he devotes his time to writing on his favorite subject, the foundations of science.

With rare and commendable courage Dr. Westin calls the attention of the Nobel directorate to the flimsy foundation upon which the claims of Einstein to scientific greatness are built. Westin's summary of the situation includes the following pertinent criticism:

1. Einstein claims that he has discovered the fact that there is no absolute motion. This discovery was made long before the advent of Einstein and he has not advanced the theory one iota.

2. Another alleged discovery of Einstein is that time is relative. This, again, is an old idea which cannot be accredited to Einstein. He has, however, tried to foist upon sensible people the reason-twisting mathematical manipulation of his intellectual affinity, Minkowski, by which an imaginary value becomes a real time. From this perversion there followed another intellectually thrilling fallacy that the world is four dimensional. Our world is three dimensional and every physical fact bears testimony that this is true despite the so-called super-intellectual wishes and desires of the Einstein-Minkowski cohorts.

3. Westin points out, in this connection, that Einstein after accepting the four dimensional hallucination of Minkowski became so intellectually intoxicated that he forgot the doctrine of his master and literally annihilated two of the dimensions with the result that our world must now manage, as best it can, to survive with two dimensions instead of four, as originally intended by Minkowski. In this manner did the magician Einstein transform the world into a two-dimensional surface whose area can be computed, by this super-scientist, by dividing the volume by the weight of the matter in the surface. This type of fantastic speculation is supposed to represent the super-reason of the twentieth century. One may readily understand why it is so difficult to distinguish genius from insanity.

4. According to Lorentz and Einstein a moving body becomes shorter in the direction of its motion. This contraction theory of Lorentz, adopted and fostered by Einstein, receives a staggering onslaught at the hands of Westin who shows that if this theory is true then many celestial bodies would be annihilated because of their velocity.

Dr. Westin's powerful article points out many other glaring irrationalities in Einsteinism. He concludes his article by citing definite charges of plagiarism against Einstein, including the notorious case of the identity (including errors) of Einstein's formula for the bending of light with that of Soldner (1801). Westin also cites the charge made against Einstein that he owes his alleged discovery concerning the motion of the planet Mercury to the earlier work of Paul Gerber (1898).

Dr. Westin concludes his communication with the following statements:

"From these facts the conclusions seem inevitable that Einstein cannot be regarded as a scientist of real note; that he is not an honest investigator; and that no valid reason can be assigned for awarding him the Nobel premium. It behooves the Nobel directorate carefully to examine all the charges of plagiarism made against him before taking an irrevocable step which later may be regretted."

Was Einstein brought before this tribunal to defend himself against these charges of plagiarism? We understand that he was far away from Sweden at the time the award was made. Has Einstein ever flatly denied the charges made against him and has he ever tried to show that they are not true? If he had, the world would have known it by every means under the control of his supporters.

It would seem that the same sinister influence which forced Einsteinism upon the world has controlled the decision of the Nobel directorate in its recent award. In view of the timely warning of the fearless and honest savant, Professor O. E. Westin, it is difficult to find any justification for the directorate in bestowing the Nobel premium in physics upon Albert Einstein.

Miniature Gas-manufacturing Plant at Smithsonian

PRACTICAL lessons are taught at the Smithsonian Institution at Washington by means of little models. Many of these mute instructors may be found at this institution. The rapid depletion of natural gas caused the Smithsonian Institution to build a little model of a gas-manufacturing plant which would serve to educate consumers concerning the method and equipment employed in manufacturing and delivering gas for consumption in the home. This little faithful replica of a large gas-manufacturing plant, although complete in every detail, is so small that it takes no more room than is afforded on the top of an ordinary table. The story of how gas is manufactured is silently told by the little model. The miniature plant traces the reduction of coal to "gas house coke" and impure gas. It shows how the ammonia, sulphur and iron impurities of the gas are removed. The volume of pure gas generated by the plant is then measured by the station meter and passed on to the large storage holder.

(C) Harris & Ewing

This little gas-manufacturing plant is complete in every detail. It stands on the top of a table in the Smithsonian Institution.

The gas holder is so constructed that it equalizes the input and output. A governing device converts the variable intake pressure into a constant pressure at the distribution point. From the governor the gas flows into the street mains and finally it reaches the various household-consuming appliances. We are indebted to S. R. Winters for the description of this model.

THE LIBRARY OF THE UNIVERSITY OF ILLINOIS

BRIEFLY TOLD

Bonar Law, Prime Minister of Great Britain, is the son of a frontier Presbyterian clergyman who came from County Antrim, Ireland, and settled in the Richibucto district in New Brunswick. In those pioneer days the father farmed as well as preached. The house which the family occupied, a little wooden story-and-a-half dwelling, still stands.

Mount Vesuvius, at night, is white to the edge of the crater; the reflection of the eruption glow on the snow is visible many miles out at sea and makes the city light as if from moonlight.

A "campaign of kindness" has been inaugurated by coeds at Northwestern University. Eighteen sororities have voted to discontinue their regular semester dance, and to use the $2,500 or more saved in this manner for a Christmas fund for Evanston's poor children.

A verdant inaccessible valley of approximately 640 acres has been discovered by a miner high up in the Salmon River mountains in Siskiyou County, California. The valley is walled in by jagged granite rocks. A creek meanders through the valley and falls 800 feet over a precipice. A view of the valley was obtained by means of a spy glass from the top of an adjoining peak.

The temperature rarely goes below 10 degrees above zero in Western Iceland.

It is now possible for aircraft to cross the Sahara Desert safely by means of a buried cable through which an electric current flows. The current influences delicate apparatus on the plane or airship so that the pilot is able to tell his exact position at a glance.

Great Britain, France, Italy and Czecho-Slovakia have agreed jointly to lend to Austria one hundred and thirty million dollars, of which thirty millions are for repayment of previous loans made her by these states, for rehabilitating her finances, and placing her currency upon a stable basis. This loan will be secured by the Austrian customs, the tobacco monopoly and other assets.

Less than two per cent of the Scottish orphans who are brought to Canada by the Quarrier Homes are, according to government statistics, failures in after life.

A sanity test will be given all persons arrested for speeding in Indianapolis. Those held for an examination by the sanity commission will await the test in jail, the state law providing that they cannot give bond.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

Two years ago slaves were sold and bought in the bazaars of Afghanistan. The Ameer of Kabul ordered all slaves to be set free in that city in January, 1921, and by March of that year, 21 men slaves and 673 women slaves had been emancipated.

"Jail the flirt," is the slogan of the Anti-Flirt Association which was organized recently at the Hotel Biltmore in New York City to prosecute a campaign against the masher. Through publicity, the association intends to educate public opinion to the point where a woman will consider it her duty to prosecute the masher who attempts to force his attentions upon her. The association intends to have its own counsel who will aid in prosecuting all masher cases.

Monkeys showing clear traces of having suffered from smallpox have been found by explorers of the Brazilian wilds.

The Bureau of Fisheries five years ago planted Atlantic coast lobsters in Puget Sound marking them with the mark "E-17." One of the marked lobsters was recently taken from the waters of Oregon, 500 miles south of Puget Sound.

A "talking movie" device, invented in Italy, which is based on the principle of phonetic and optical simultaneity, was successfully tested in Rome recently.

A training school for nurses will be built in Paris and administered by the American Committee for Devastated France. In preparation for the work of administration in the new school, three French nurses are attending special classes at Columbia University.

A sheep can exist for 280 days solely on a diet of prickly pears, according to experimenters on the government agricultural farm near Johannesburg, South Africa.

Dr. Duncan Spaeth, professor of English at Princeton University, says, "I think that public opinion ought to control the whole matter of the motion picture, because it touches the life of the growing generation and brings about new experiences in a way which nothing else does."

Important crime news is barred in Japanese papers in the belief that the publication of facts may assist the criminal to escape.

A claim for possession of more than 1,500,000 acres of oil land, located in the Panhandle section of Texas, will be presented to the Texas legislature by attorneys for the Texas Cherokee and other kindred bands of Indians. The claim is based upon a treaty between representatives of the existent Republic of Texas and the Indian tribes nearly a century ago.

The fur market of Paris is flooded with specially prepared rabbit hides masquerading at high prices as rare Hudson Bay and Russian furs.

Carbon tetrachloride, a common and cheap chemical, has been developed into a cure for hookworm by a scientist connected with the United States Department of Agriculture. Reports from the Fiji Islands and Ceylon show 100 per cent of success in thousands of cases. All persons treated show a great amount of increased vigor.

A youth of 23 was chosen secretary of Yale University.

Vote or do jury duty is the program in Cleveland. The city clerk is going to have juries selected from a list of 65,000 citizens who failed to register at the last election. He intends to get the registration lists for the last two years, check 2,500 who did not register this year and put their names in the jury wheel. He thinks his idea is a good one to increase exercise of the franchise and enrich the treasury where all citizens who register must pay a poll tax.

Twenty-five secretaries deal with the Pope's daily mail which averages 22,000 each day.

A gold strike 60 miles up the Nahanni River, a tributary of the Mackenzie River, has started a wild rush of claim stakers from Fort Simpson and other trading posts along the Mackenzie. More than 100 claims have already been staked and the trails along the South Nahanni are cluttered with gold seekers.

FACING THE ISSUE SQUARELY

One reason for the rapid growth of THE DEARBORN INDEPENDENT is due to the fact that no matter what problems or conditions it discusses, this publication ALWAYS FACES THE ISSUE SQUARELY.
Being non-partisan, non-sectarian and free from any entanglements, THE DEARBORN INDEPENDENT publishes information based on facts and nothing but facts.
More than 250,000 subscribers testify to its value and thought-provoking qualities.
Any Ford Dealer will gladly accept subscriptions or they may be sent direct, using the blank below.

ON GUARD!

Alien forces in American life which in the past have succeeded in creating smoke screens of propaganda in behalf of selfish and sinister purposes, are continuing actively their attempt to break down the present all too inadequate restrictions against immigration. Seldom has there been witnessed in this country a finer example of the success of cleverly directed propaganda. "Manufacturers Associations" and "Farmers Organizations" are going on record here and there as favoring the letting down of the bars against immigration. The cry is that "farmers are needed on the land." Bankrupt American farmers should take cognizance of this alarm. The cry is that "cheaper labor is needed if we are to compete with the world." The truth is that unrestricted immigration would bring neither *cheaper labor* nor *farmers. It would bring new swarms to the cities that are fast being swallowed up by the aliens already permitted entry.* Let American voters take heed now. Tell your Congressman to listen to Americans instead of to paid alien propagandists.

CHRONICLER OF THE NEGLECTED TRUTH

"The Shover" Tells Why Counterfeiters Fail

Old-timer Believes Silk Fiber Paper Has Much to Do With Failure

By GEORGE C. HENDERSON

"THE SHOVER," they call him at San Quentin prison, although strictly speaking he wasn't a shover at all. He had gained entrée to the select society of the "big house" by usurping the governmental prerogative of making $100 bills. He had served his term and now he was to be freed.

I saw Jake Emerson as he came through the gate. Other convicts had been coming and going through the same portal of the medieval tower. As they passed out, the guard at the door would say, "one out, warden's office" or "one out, stables" and his words were taken down by another guard.

The counterfeiter, gray, stooped, careworn, his body shaking with the palsy of over-eagerness, hurried through the steel gate as if afraid that it would close upon him. The guard did not count him. A released felon did not figure in his official routine.

Jake wore a suit of old civilian clothes. The trousers were too short and the coat too baggy. This attire had been taken into the prison by some short, corpulent person and now it was given to "The Shover" in accordance with prison custom.

"It ought to be easy to make counterfeit bills," I suggested after we were seated on the electric train, San Francisco bound. "Why do you fellows fail?"

He glanced furtively around.

"It is easy," he said in a low voice. "You've been a good friend of mine and I don't mind telling you that I've found a way of beating the game.

"Don't you believe I've been mooning away my time in a cell for two years for nothing. Keep this under your hat but watch for the big clean-up."

Jake Gets a New Bill

HE REFUSED to say more and laughed at the suggestion that he should take honest employment.

"Once a counterfeiter, always a counterfeiter" is an axiomatic expression.

I knew Jake's history and I was not surprised to find that he planned to go back to lawlessness. There is an irresistible lure in this form of outlawry. The "old-timers" cannot put aside the feverish urge to make their own money.

First Jake had served time in Pennsylvania for "base metal" work, making silver dollars out of a lead mixture. Three years in a cage gave him opportunity to reflect upon his mistakes and he left prison firmly convinced that he would have succeeded had he made bills instead of coin.

Emerson spent the next few years studying steel engraving, was arrested with plates in his possession and given another prison term. Before his incarceration, however, he was a fair engraver.

Out of prison, Jake decided to "shoot square," as the convicts call it, and went to work on a dairy ranch. For five years he worked steadily, putting his money aside, establishing a reputation for honesty and sobriety. During all that time he was mulling over in his mind the mistakes he had made and thinking what fine money he could manufacture. He was unable to break the spell.

One day he saw a small printing press and line engraving outfit advertised for sale. The price was within his means. He cast the temptation aside at first but some time later he drew his money from the bank. There were five $100 bills and some change. The bills were all crumpled and soiled.

Jake threw one of the soiled notes back and said:

"Give me a brand new bill for that, won't you? I like the new ones."

A counterfeiter must have a new note to work with.

Emerson placed this new bill in a folder so it would not crease. Each night after milking he studied this $100 bill. He dreamed and planned feverishly.

Jake met "Denver Slim" and "Little Mac," two ex-cons and former cellmates, and in a hotel room over glasses of liquor they listened to his plans.

And that week Jake Emerson quit his job and went into the counterfeiting business.

Plans to Make a Million

FIRST Jake made the steel engraving. It was a difficult process and he worked at it for months, discarding plate after plate for some imperfection. The two jailbirds became impatient and cursed the master workman for his procrastination, but he made them understand that it was his game. At last, however, he brought forth a product that was near-perfection. Then he set about to make the plate for printing the other side of the bill.

Proofs of the engravings caused "Denver Slim" and "Little Mac" to go into the wildest ecstacies. They wanted to take the crude proofs out and try to pass them at once.

"We will make 10,000 bills, totaling $1,000,000, before we pass any," said Jake Emerson. "When we have a million, we will split it three ways, destroy our plant, dies and all evidence and then unload our $333,333 each as quickly as possible. By traveling day and night we can put the bills in circulation in a week and when the Feds start looking for us, none of us will have a single bad note and the plant and dies will have vanished in thin air.

"That's what I call 'covering up.'"

Apparently both accomplices agreed.

From his paper samples, Emerson picked out a bond that was as near like the government paper as possible, but only one-half of the weight. He cut several thousand pieces of this into sizes a bit larger than a bill and proceeded to print his plates, using a dark ink for the bill proper and touching up the seal with blue. The serial numbers he had to put on with a rubber stamp in blue also.

"Denver Slim" and "Little Mac" both developed skill at the work, so that in two weeks each conspirator had $5,000 worth of bogus paper money, which he was pledged not to pass until it had grown to $333,333.

The temptation was too strong for the ex-cons. One night they went out on a jamboree and put $10,000 in circulation. Even the banks accepted them. But there was one class of money handler who could not be duped. And these were a few women. Emerson's currency got into the United States Treasury. Here it fell into the hands of the women money-counters, through whose fingers millions of dollars pass daily. They can tell the denomination of a bill by the feel, without looking at it. Paper money slides through their hands with machine-like rapidity and precision. When they find a counterfeit they throw it out of the pile without losing the cadence of their count.

One came upon an Emerson note. She threw it on the counterfeit pile with a glance. United States Secret Service men took that bill, studied it and then sent out a description of it and a warning. Presently, scores of the notes came pouring in, all having their origin in San Francisco. A description of the two men who had passed them was compiled through information gained from their victims and the local authorities identified "Denver Slim" and "Little Mac."

The first thing that Emerson knew of the treachery of his companions was when a couple of Secret Service agents crashed their way into his plant, slipped a pair of nippers on his wrists and confiscated $100,000 worth of bad money. He pleaded guilty and was let off with two years' imprisonment and was sent to San Quentin instead of to McNeil's Island. I met him at the expiration of the term.

"Watch my smoke," said Jake, as we got off the ferry boat that had carried us across the bay to San Francisco. "I'll be driving up to your place in a limousine one of these days."

Six months later I received a telephone call from him.

"I'm down in the city jail," he said. "Come and see me."

He was the picture of despair as he sat behind the steel grating with his head in his hands.

"I told them it was perfectly good money; that I had made it myself," joked Jake, grimly, "but they wouldn't believe me. What makes me sore is that I had worked out a scheme that would have made me rich just when they nabbed me for publishing a few measly government checks. I hate to get picked up on a piker deal like that just when I had enough coin to start work on my big scheme.

Life of Bogus Note Short

"REMEMBER I told you one time how much trouble I had imitating currency bond and making good steel engravings? My big idea was to make the government do all that for me.

"My plan was to 'raise' the bills instead of manufacturing them," he continued. "Here is a $1 bill. I can make it $10 in an hour's work. I don't need plates nor other junk. The secret part is the chemical I use to take the coloring out of the note.

"You can't beat the game, Jake," I said. "One would naturally think that with modern methods, even a mediocre mechanic could copy and reproduce currency and government bonds at will. Yet you counterfeiters are detected almost before you get under way. Why is it?"

The old fellow was silent for some time. His wrinkled countenance displayed no emotion.

"I wish I knew," he answered. "I've done a lot of time because I can't answer that same question.

"Charley Ulrich, one of the best of the old-timers, used to say that there was something about cutting a counterfeit plate that made it impossible to do a perfect job. I have experienced the same thing. You tell me what it is. Do you think that concealed inside of all of us there is a moral force that fights against any crime? Or is it just fear?"

He drew from his pocket a $5 bill.

"See that," he said, flipping it with his hand. "If that very same bill, just as it is, were a circular you wanted reproduced, I could do a job on it so that you could not tell the original from the copy. Just because it happens to be government currency my hand loses its cunning.

"Yet I believe it is the silk fiber paper that is the downfall of the most of us."

One factory in the United States is permitted to manufacture the silk fiber paper used in making American currency. This plant in Holyoke, Massachusetts, operates under the strictest supervision, secret service operatives being present at all times to see that none of the valued parchment is taken away or is shipped out except to government money printing plants. A fine of $5,000 and 15 years imprisonment is provided for any person found with this paper. The paper is the very finest and toughest of bonds, but the distinguishing feature is the silk fiber woven into its texture. This is manufactured by a secret process. No one man holds the key to this process, thus no disgruntled employe could flee to Mexico or some other land and start making currency bond. One individual knows certain details of the secret but it requires the co-operation of several trusted experts to put out a perfect product.

If the government engravers want to make and throw away a hundred plates before they secure one, they may do so. One man could not do that. Thus a lone workman cannot equal them in craftsmanship and the result shows in the product. Any one of them would be better than the best worker on the outside and when you take the combined genius of all, they cannot be approached.

Even if a counterfeiter could secure the silk fiber currency paper, he would not be able to imitate the art exhibited on government money closely enough to deceive an expert bank teller.

The life of the bogus bank note is short. It is put into circulation. To the man on the street it appears to be genuine. But the minute it passes into the hands of a bank teller or cashier it is betrayed as a fraud by the blurred lines, the irregularity of the numbers, the unfamiliar thickness of the paper, the harshness to the touch of the parchment or the imperfect coloring or shape. The genuine is perfect in all these respects.

Curiously enough these experts who detect counterfeits so easily rarely study them. Few tellers or cashiers have ever seriously studied counterfeit notes but they do know the genuine. For the year ending June 30, 1922, 39 new counterfeit notes were discovered. Most of them were photographic reproductions and none had been out more than a few months. This is a record-breaking figure.

1,025 Arrests in Single Year

THE Secret Service is responsible for the short lives of these contraband notes. For the year ending June 30, 1921, government detectives made 1,025 arrests for offenses against the currency, coinage and government checks. Of the total, 324 had raised the figures on bills, 259 had falsified government checks and the remainder were counterfeiters. In this year, $196,993 worth of bad currency was confiscated and $12,279 in lead dollars destroyed.

Realizing the necessity for safeguarding the currency of the nation, banks and commercial houses report promptly to the Federal authorities when they receive a bogus bill. The Secret Service has the country divided into districts and it is the duty of each chief operative to keep his district clean. Immediately a counterfeit issue is discovered, every agency is put to work to locate the author of it. All known offenders, whether free or on parole, are placed under surveillance. Descriptions of the counterfeit are printed and sent broadcast. Everyone is on the lookout for it.

In the old days the chief of the Secret Service could tell who had made a counterfeit frequently by merely looking at it.

"This is the work of Miles Ogle (or Charley Smith or Charley Ulrich). Bring him in," he would say. The veteran steel engraver left his trade-mark on his work just as surely as the pen and ink artist identifies a portrait by his style. But cameras know no style.

Although Federal judges seldom impose the maximum, they may at their discretion sentence a man to a term which equals life imprisonment. The maximum term on one count that can be doled out to the currency counterfeiter is 15 years and $5,000 fine. For a coin counterfeiter it is 10 years and $5,000. However, the criminal may be given 15 years and $5,000 for passing the note, another term of the same degree for making it, still another for having the note in his possession and several more such sentences for making the plate and having possession of the plate. They needed only one count, however, to put old Jake Emerson away for life. The judge gave him 15 years which means that "The Shover" will die in prison. There will be no "next time" for this optimistic crook.

Note raising has become the favorite of the counterfeiter. The crime is on the increase, despite the fact that anyone can distinguish the frauds by the numbers in the corners of a note.

How a Combination Works

THE counterfeit combination considered best is that which involves a "maker," a "dealer," a "boodle carrier" and a "shover."

The dealer buys the counterfeits direct from the maker in large quantities for about 60 per cent of face value. He then retails them to the boodle carrier who hires a shover to pass the stuff on the unwary.

The boodle carrier may have several thousand dollars' worth of bogus money in his possession at one time but he personally will not try to "shove" any of it. Instead he gives the "shover" one bill at a time and hides out within eyesight while the latter puts the currency into circulation. After the "shover" has passed a bill, the "boodle carrier" meets him surreptitiously and hands him another counterfeit.

If the shover is arrested, he has but one bill and he can plead that it was given to him in change. The "boodle carrier," watching, flees and warns the dealer if the "shover" is arrested and the dealer in turn notifies the counterfeiter. Even if the shover squeals he can involve no one but the boodle carrier.

Theoretically, this system protects the criminal. In reality the suspect who passes even one bill at a time may be convicted if the prosecution can locate several of his victims.

There are three distinct types of counterfeiters. They are the steel engraver, the photo-engraver and the coin counterfeiter. Few steel engravers are encountered today. Photo-engraving has supplanted other processes.

The Motion Picture Industry Enters Politics

Seeks to Repeal Ohio Law Because of Trash Censors Have Eliminated

OHIO has had a motion picture censorship law for a decade. In years gone by it was only a name; now it is anathema to those producers and distributors who wish to unload upon the state their salacious trash under the high-sounding and impressive slogan, for advertising, of "million dollar features."

The law and the censors, being in the way of the aims of the industry, must, perforce, go; and that is the object of a quiet, very quiet campaign which is being waged in Ohio today.

Producers, distributors and local-theater managers awoke, a little less than 18 months ago, to the fact that Ohio had a censorship law with teeth and a chief censor not afraid of the wrath of those less interested in public morals than private profits. She was Mrs. Evelyn M. Snow, of Mt. Vernon, representative of Vernon M. Riegel, head of the department of education, under which the censorship division operates.

The censorship activities of Mrs. Snow, her drastic measures to insure clean films for Ohio, and her campaign of education attracted attention for months. She was bitterly attacked by the industry, internal dissensions broke out and these led to her removal about June.

Film men heaved a sign of relief, but it was short, for in the act of the heaving they got a new shock.

"What do you think of the present Ohio censors and the censorship law?" a local manager of state-wide reputation was asked a few days ago.

"Worse and worse," he answered disgustedly.

Rejecting the "Super-feature"

HE HAD advertised a "great" feature to open in a few days, one said to have cost $1,500,000 to produce. It had been shown in other states and the reports were that it was a box-office attraction of the first power. The name was a drawing card and the star one of the most popular on the screen. All Ohio theater managers who had booked it expected a land-office business.

"Rejected," was the telegram received by each from the Board of Censors and this means that this attraction will not be shown in the state unless it is so reconstructed as to meet the approval of the censors.

Why was it rejected? Let the censors give the reasons.

"We saw the film several times. It was difficult for us to make up our minds because it had many fine parts to it but we reached the conclusion that while it might be perfectly harmless for adults, it would have a corrupting influence on the child. We rejected it and the director (Mr. Riegel) sustained us."

The censors, too, want to uphold the law which says that "only such films as are in the judgment and discretion of the Board of Censors of a moral, educational or amusing and harmless character shall be passed."

And these censors, who are the targets for more concentrated criticism than any other public official in the state, are merely two young women, neither much more than 25 years of age, eager to do their duty to the state as they see it. A week before Mrs. Snow was dismissed they were named as assistants from the Civil Service rolls. Miss Mary Edith Luethi, of Columbus, a graduate of Ohio Wesleyan University, is a Presbyterian. Her associate is Miss Susannah Warfield, a graduate of Ohio State University at Columbus. She is a Methodist.

"The motion picture industry is in politics," one of the foremost church leaders in Ohio said only a short time ago and there is every indication that he knew what he was talking about.

Seeking Sunday Appeal

ONE law on the statute books prohibits the showing of motion pictures on Sunday. It is enforced in some cities; in others it is not. It is part of what our "liberals" term the "blue laws." An attempt will be made to have it repealed at the session of the legislature starting January 1, 1923, provided the motion picture interests see any hope of success. One of their representatives in the last few weeks has been traveling throughout the state, urging local managers to feel out public sentiment and to get the attitude of the county's representative in the legislature on the proposition of repeal. Their idea is not only to legalize the showing of motion pictures in the state in houses already established but to open up new theaters in the smaller communities for Sunday showings only.

Failing in this, they will agitate strict enforcement of other so-called "blue laws" in those cities not now permitting motion picture exhibitions in the hope of forcing public sentiment against officials, who, in turn, will allow theaters to open.

Succeeding in this, they will go one step further; it may be presented at the session of the legislature starting the first of the year; if conditions are favorable, they hope to marshal sufficient votes to repeal the censorship law. There is little likelihood of this being done, however, and the politicians of the motion picture industry know it, so the great idea on which they are centering their forces is for a popular vote on censorship.

Ohio has the initiative and referendum. It's no trick to get sufficient signatures to obtain a vote on almost any proposition. All you have to do is to get some petition peddlers, send them throughout the state, wait a little while and they will return, provided their expense money holds out. But the motion picture men will be saved this expense. The petitions will be placed at the theaters and patrons urged to sign.

They have hopes that the people will reject censorship. This is based on the vote in Massachusetts when the industry fought the churches and the legislature and obtained freedom of all restrictions; this, too, after the legislature passed a censorship law by an overwhelming majority.

This defeat is attributed largely to the well-planned and carefully organized campaign of the film promoters, who, with their wonderful and unsurpassed facilities for advertising and an unlimited amount of money, were able to get their message across to the people. The opposition forces were disorganized and lacked these extensive means of publicity. Protestants and Catholics working together were unable to meet the campaign of producers. One side was fighting for dollars; the other for a great moral issue and it's easier to fight when your pocketbook is affected than when your neighbor's morals are endangered.

The campaign in Massachusetts, and the quiet, almost whispering campaign in Ohio, lead one to think that there is a master politician directing the affairs of the industry. One pauses to ponder the tremendous salary paid to that astute political manager, Will H. Hays, to "clean up the movies" in the light of his recent action, and to wonder if his services in another line are not proving more valuable to his employers.

The censors of Ohio believe heartily in censorship. They believe it should be national in scope, instead of, as now, limited to a few states, seven to be exact, and a number of cities in other states. Censorship admittedly does not solve the problem of clean pictures but it is a long step in the right direction. It helps to awaken the public conscience to the danger of such licentious pictures as are flooding the market.

Censorship in Ohio alone has cost the industry millions. A charge of $1 is made for each reel of 1,000 feet or less censored and no film can be shown unless it has received the approval of the censors. From 20 to 50 reels are reviewed daily; eliminations are ordered in probably an average of 10 per cent; some are returned with instructions to be revised or reconstructed; some are rejected entirely.

Add to this the fact that many films which the producers know to be objectionable are not even sent to the state. They refuse to take the chance.

"One of the chief benefits of censorship in Ohio," the censors say, "is the refusal of these producers to send films here which they know stand no chance of being approved. If it were not for this law, the state would be flooded with pictures unfit for anybody to see.

"The producers or distributors often tell us that the local manager demands pictures that are risque. The local managers tell us they do not want pictures of this type; that their patrons do not approve of them. We believe the managers. They know their people and the manager with an eye to his future prosperity does not want pictures that offend good taste."

"Triangle" Film Frowned On

THE censors realize the difficult position which they hold. They know no picture can please everybody and that what they may consider unfit would be passed by some one else. They are merely trying to see the pictures through the eyes of the law.

The storm which has been waging about the division since Mrs. Snow assumed her duties took on added velocity recently when Director Riegel called a halt on the "eternal triangle" film, on which his censors had reported. Many of these have been shown with the ultra-salacious portions eliminated and others had been rejected. Mr. Riegel notified distributors that censorship of these would be even more vigorous than in the past. Here's his letter:

"Motion picture productions may have various objectionable qualities that bring them within the scope of the censorship law enforcement. However, we think the one great, outstanding, objectionable feature of the motion pictures, and the one that is most menacing to the welfare of society is the sex question involving the love triangle and other illicit love affairs. It will, therefore, be our policy in the future to censor such films strictly. Legitimate love-making scenes that do not border on licentiousness, salaciousness or lewdness will not be banned. We shall be as liberal in our censorship in general as is possibly consistent with the proper performance of official duty, but strict censorship of pictures involving illicit sex questions will be our policy in the future."

In the last six months 24 screen productions have been rejected; others have been revamped, and all have involved the sex question to a greater or less degree.

One favorite bit of what the producers are pleased to call comedy is to place the Protestant minister in a ridiculous, ludicrous and occasionally a risque situation. Sometimes he is made to kiss a bride. At other times he is smoking cigarets, drinking or put in some undignified position. Ohioans do not know how many times the producers try to put this across; the censors do and only in the most unusual cases is it permitted to go to the public.

Here is a typical order of the censors:

"Cut out all scenes of minister represented as a comic character marrying couple and all scenes of bee stinging minister on head and his head swelling."

Not so many months ago, the country was entertained by newspapers and rotogravure sections of Sunday papers picturing "the most beautiful legs in the world," showing a petite feminine visitor to America. Of course she was screened and the pictures shown in many states. But not in Ohio. The censors rejected this so-called feature. It is one of the commonplaces of the silver sheet to show women with as little clothing as possible. Clothing is a requirement of the Ohio censors in approval of pictures.

Pictures displaying too much of the human anatomy, bootlegging, girls smoking cigarets, long passionate embraces, gatherings of the Ku Klux Klan, cruelty to animals, arson, crime—all these are either taboo or reduced to a minimum.

Use of the name of the Creator in a vulgar sense is not encouraged; seldom allowed. Even "hell" and "damn" are eliminated.

Scenes which are obscene, salacious, immoral or teach false ethics are not permitted.

Here are only a few of the orders of the censors in the last six months:

Cut out scene where Brainerd kisses mayor's wife on neck.

Cut out scene showing Jack Johnson and all subtitles referring to him.

Cut out all scenes where women are drinking.

Cut out scene of prisoner taking saw out of banana.

Cut out scene of man pouring liquor down woman's back.

Cut out scene of woman lying on couch and man bending over her.

Cut out scene of woman in transparent gown before burning building.

Cut out all scenes of Night Riders.

Cut out subtitle, "Making moonshine where the sun shines," and cut out all scenes and subtitles relating thereto.

Cut out all scenes of girl shimmying.

Cut out scenes of girl pulling up her garter.

Cut out subtitle, "Bedtime and use your own imagination."

Cut out all scenes where boy is shown with gun.

Cut out all burlesque scenes of Heaven.

Cut out subtitle, "Does your womanly intuition give you any idea of what is going to happen now?"

What is the effect of such scenes and subtitles on the public conscience? What of public morals? What influence will it have on the next generation?

The Contest That Is Shaping

OHIO censors hope the producers will co-operate with them and send clean pictures to the state. If they do not co-operate it will be their loss. Ohio is demanding a higher grade of motion pictures. The producers are preparing to fight. They do not want to be interfered with in their demand to present such pictures as they see fit regardless of public morals and the effect they will have on the mind of the child.

The contest has not reached that stage of development where it is receiving the attention of the newspapers. Perhaps it will during this session of the legislature and if it does, the public should be fully informed as to the value of this law on the statute books. When they do know the facts it may not be difficult to predict, at least, that the representatives in the legislature will be advised to vote for the right.

Ohio's situation is different than that in Massachusetts. Ohio has the law and, to a certain extent, there is public sentiment behind it; the Bay State had no such law in force. It is easier to defeat a measure proposed for law than to repeal a law, the benefits of which have been accepted by many.

It will be a contest between the motion picture producers, distributors and managers on the one side and the forces of moral righteousness, led by the churches, on the other. Ohio, to its honor, has a strong church federation with headquarters in Columbus. Its leaders are aware of the campaign to repeal the Sunday closing law and also the censorship statute. They have not been caught napping and the result in Massachusetts has taught them that it will not be an easy contest. Therefore, they are preparing, and the state may see a contest rivaling in interest that of last November when an attempt was made to vote a wine-and-beer clause into the Constitution. The attempt failed by 200,000 but interest was greater than in any other issue or for any office.

The Managers Are Difficult

THE progressive manager, the man with a vision, will not show films that are suggestive. Some of the more conscientious cut out certain parts themselves. One, a few weeks ago, called in a committee of women and had this committee make selections for an entire week. But a great many, a majority by far and large, take the big features as they come, regardless of the effect they have on the minds of the young. His eye is solely on the box office.

When Mrs. Snow was censor a remark attributed to her and later denied was that 75 per cent of the people were unable to act as censors of the pictures they see. The movie fan goes to his theater for entertainment and not for criticism. If he sees an unusually objectionable scene, he comments on it for the moment and thinks he has forgotten it. He does not think of the effect of a repetition of such scenes on the youthful brain or even the influence on his own character.

Ohio gets cleaner motion pictures because of its censorship, but the situation is not ideal. The censors are fallible. They pass scenes which in some cases it seems they should not pass and they also reject scenes which in the opinion of many should be permitted. Their ideal is to approve only such pictures as are moral, educational, amusing and to bar the suggestive and the salacious, or those which teach or elevate crime.

The Stir at Washington

THE allegation of American "aloofness" from European affairs has been punctured. But so general has been the assumption that our government was aloof that even the ranking member on the Foreign Relations Committee of the Senate made a proposal that the Government take a certain line of action looking to a finding of facts with regard to the condition of Europe.

That, in brief, is the meaning of the Borah resolution. Its presentation exposed a strange situation and action followed. Consider that had Henry Cabot Lodge been defeated (which came within an eyelash of occurring) Senator Borah had succeeded to the head of the Senate Foreign Relations Committee. Consider that Senator Borah, so far advanced on that committee, introduced a resolution counseling action. Consider further that he did so in ignorance that anything was transpiring in the Executive mind—and there you have a complete picture of the way our own Government functions. Upon hearing of Senator Borah's action, the President communicates with Senator Lodge deploring such action, because, as the President said, the Executive had a helpful plan which should not be interfered with. Whereupon, of course, Senator Borah gracefully withdrew. Then the second thing occurred: on the evening of December 29, Secretary of State Hughes made his New Haven Speech, which really deserves reading. Although the whole matter is veiled in lies and concealments and delusions, Secretary Hughes does state in unmistakable terms the attitude—we may say the entirely correct attitude—of the United States Government.

The funny element in the chaos is that Senator Borah was led to action by the naval amendment. The question of armament was up, the United States was arming again (quite properly perhaps) when the Senator was moved by the inconsistency of the thing. There had been a Disarmament Conference, or something of the sort, at Washington recently, had there not? Yes. Well, then, why go on arming? Because Europe was in such a commotion. Then why not call another Conference to deal with Disarmament and Europe? These conclusions of a direct mind are embarrassing. Senator Borah may be wrong, but he is consistent. The Administration may be right, but it is not consistent; it keeps telling the people one thing, or permitting the people to believe one thing, while it is really proceeding along another line. The American people are the worst bamboozled people on the earth today. Every other nation is "on to" the tricks of Governments, except our nation. We're still the babes in the woods. Maybe it is providential that we are; maybe the awakening will be the more effective for that. Anyway, Senator Borah stirred up the worst kind of an alarm by making the most innocent kind of a suggestion.

What the Administration now proposes to do, as its reason for asking that Borah withdraw his plan, is to supersede the League of Nations in the matter of reparations: it proposes to call an Economic Conference. The Administration is perfectly correct in so far as it assumes that no conference of European Premiers can ever settle the Reparations Question. Not because they do not know how, but because they are not free agents. No Premier of Britain or France can go into conference on German reparations and pretend to be honest. His whole job is to maintain his balance between the facts as they are, and public opinion at home. The interested nations would destroy a Premier who worked the problem out scientifically, and would repudiate his undertakings. That fact is recognized by the Administration, and it is a fact.

But whether the United States has anything to do in the matter is another question. What about the League of Nations? Isn't there a League of Nations? Have not we been besought for years to join the League of Nations, the great Court of the World's Justice? Wise observers have been convinced for a long time that the Reparations Question is on its way to the League of Nations: why hinder it with another Conference?

Secretary Hughes has done this service: he has made coldly clear the fact that the United States regards the Reparations Question and Europe's Indebtedness to America as two separate matters, not to be mingled or confused. He points out that the Reparations Question would be precisely the same if there were no European indebtedness to America. In this, Mr. Hughes has checkmated the obvious intention of International Financiers to rope in America and flimflam her: and the International Bankers who propose to do this are resident in the United States.

Now, although it appears plain that the proposal of the President to call an Economic Conference (not to sit at Washington but at Brussels) is a concession to the pressure brought to bear by International Financiers, it is equally plain from the statement of Secretary Hughes these gentlemen are not to have it all their own way.

If such a Conference is called (and no one except the International Financiers will be overly enthusiastic about it) the best counsel we can give to President Harding is to be careful, mighty careful, more careful than he has ever been about anything before, whom he chooses as America's representatives. Let them at least be American and free of allegiance to any alien banker.

Taking the Tariff From Politics

RECENT news dispatches from Washington, evidently inspired, are that President Harding is to confer with the tariff commission with a view to settling such changes in the Fordney-McCumber Act as are necessary to make the schedules workable and more equitable. Apologists for the Administration say it means the removal of the tariff issue from politics.

Does it? And if so what is the nature of the power, if not political, which hereafter will regulate the tribute domestic industry may wring from the people in the guise of protection to home manufacture?

The power granted the President to increase or decrease the schedule rates on imports is susceptible of very ill use. It gives power to insure liberal financial support of candidates, or punish where such support is refused. It not only does not remove the issue from politics, but it makes it more difficult for the people to select the legislative members of government who will decide the issue as they wish. It means the strengthening of the hands of organized monopoly by making it more easy for it to control.

It may be said that the other extreme is possible, that a courageous President can protect the people from the grafters. But the people are unorganized, unsettled in conviction, and disagree as to the causes of national ills. The interests, or that portion which will be active, are united and join in a common cause. They are powerful and really make and unmake Presidents. They control all major parties indiscriminately, while the poor dupes of imagined or real principle worship at the shrine of party fealty, unmindful of the truly tragic fact that party sheds principle as readily as men discard worn clothing.

No national issue should be out of politics. It is not the fault of our form of government that politics is abjured by many as dirty.

If the tariff has been taken from politics it will be replaced when politics shall have been purified by the liberal injection of the limpid waters of principle, and the dregs of impurity drained into the soil of democracy, to be absorbed as earth itself absorbs the fertilizing constituent, leaving the poison dead and powerless.

The Winters of Former Years

THOSE of middle age observe the remarkable revolution the last two decades have wrought in winter amusements. The automobile and motion picture have been leading causes. Concrete roadbeds do not furnish the foundation for miles of smooth, slippery track; automobiles have supplanted the spirited horses; the sleighs, "bobs" and cutters rot in storage, while the merry bells hang silent. The city swain taxis to the theater the country lad has his car, the concrete road is soon rid of the thin coating of snow and the closed all-winter car silently rolls along without hint of the buoyant happiness of the passengers.

Hayrack rides are no more save in country districts, where at least one ceremonial ride may be taken by the young folks every year. Even the clear, bright skies, with the moon a wintry silver and stars snapping frostily seem to have been displaced by fog and cloud, while river and pond seldom offer ice skating. Indeed, skating is in danger of becoming a lost art, since professionals have taken charge of youthful sports, to dictate games and drag the growing children through tiresome pageants to show them off.

Perhaps the modern youth, blessed beyond the comprehension of his predecessor of two generations ago, is as happy; perhaps the club skate is a vast improvement over the wood-bottomed "mooley" of our youth and its automatic fastening; perhaps special shoes are ahead of the straps which must be so tightly buckled as almost to paralyze the feet; perhaps the skating costume and the heated rest room make for greater enjoyment, but certainly it is all less picturesque. Why? Do you remember the old pond? Do you remember the rivalry of skill? Fancy skating is almost forgotten. Even on "moolies" the lads could spin, write their names, cut circles, grapevine, and spread the eagle in style requiring agility and speed. How many today could gain a local reputation by "cutting the figure 8" or beating the wind on skates?

The girls could skate, too. The games of pull-away, crack-the-whip and follow-the-leader led the younger ones into danger at times, and tested their skill in maintaining an equilibrium always.

Exhilarating? It was, beyond anything now imaginable. Fatiguing? Yes, of course. But it was wholesome, and brought strength and poise of carriage: it gave purity to the blood, roses to the cheek, and a depth of slumber which millions of gold could not buy.

Youth of that day knew little of dancing, if what is called dancing today deserves the name. In these days of syncopated tunes that admit of no foot accompaniment but a languid slide, real dancing is impossible.

The adolescents learned the square dances, Virginia reel, money musk, the ordinary and fancy polkas, the varsouvienne, schottische, and the stately lancers. No prettier dances than these, taken in perfect step to special music, ever were seen. Now and then, where normal folk do congregate, you see these dances, and they appear like beautiful, vivacious memories emerging from a rapidly receding past.

No, our winter sports are not the same. Neither are our winters. Even the snow is measured out less bountifully. And while youth is always self-sufficient, there are some of the privileges of youth which one could wish had remained. But, as nothing good passes entirely away, we may hope for the world a revival of all the best of what once was youth's.

Oases in the Dry Desert

THE Oakland, California, *Observer* is a keen one; for at that distance it has descried the reason for the willingness of national statesmen to remain on the job in Washington during the holiday season. And the *Observer* speaks by the card, claiming to know from participation rather than from observation.

Of course the press announced there would not be the usual recess because of "national exigencies," but that, it seems, was pure bunk. It did not mention whether any of the Senators or Representatives refused mileage, either. A brief news dispatch spilled the beans.

The dispatch announced the arrival of a British steamer in New York, the interesting part of its cargo under government seal and consigned to several embassies "on consular service." Those words are notice that the boxes and their contents are duty and inspection free and have priority rights to delivery.

That the essential cargo was of service, in a proper way, may be vouched for; and if there were any object in mellowing the relations between this country and others, who can doubt the rare wines of foreign vintage might have that effect?

So while the country went its tolerably dry way at Yuletide, the boys at Washington sacrificed the pleasure of home-coming and made frequent pilgrimages to foreign soil, sometimes no farther than across the street, to work for better international relations.

Mr. Ford's Page

THERE are people who turn away their attention whenever they see or hear the word "Europe" for it has become the synonym of endless problems and incurable disorder. And for thus turning away their attention, they are likely to be scolded or lectured for being devoid of world spirit. It is, however, worth considering whether the instinctive repulsions and attractions of the people do not mean something in themselves. After all, the great human masses have nothing to fall back upon except their instinctive feelings about things. This they feel to be right, this they feel to be wrong; this they feel to be immediately important, this they feel to be unripe as yet.

What we have missed is this: perhaps these feelings are important guidances to the facts of the situation—the larger facts. It may be, it may well be, that there is such a thing as premature activity on the part of America. It may well be that still other, and maybe unforeseen things are yet to occur in the world, before America will be free to march out on her full World Mission—before the inner promptings of her spirit will tell it that It Is Now Time.

It may be the part of wisdom to wait until the people are sure that the time for action is come. When Springtime comes, everyone knows it; we don't need special propaganda societies and squabbles in Congress to make us aware of the fact. And in some such silent way the people may be aware of the coming of the right moment.

One thing is lacking yet, and that is a definite idea on the part of Europe as to what she needs, or as to what we can do to help her. And one reason for this is that Europe does not yet think as Europe. We in America, in the greater part of America at least, think as America. But Europe has not the European sense, that is, does not think as a whole. Everywhere you are crossing frontiers, and not political frontiers only, but racial frontiers, psychological frontiers—a succession of little worlds bristling with animosity each toward its neighbor.

In such a condition as that there can be no sense of the real need of Europe, the need that is common to all parts. And yet today there is no community, except the community of need.

The commonest cry that would come from Europe in reply to the question, "What do you need?" would be "Money." Of course, that is what every wastrel, every prodigal wants. It is "the easiest way" all over again—Money! What do they want money for? Simply to perpetuate the very things which have brought them to their present condition.

UNTIL Europe discovers what it is she needs, nothing vital can be done for her. The common cry is that she needs Money! That cry is encouraged by dealers in money, who live off that largest tax-roll in the world, that most unremitting tax system in the world, the interest system. Money was the ruination of Europe; something else will have to prove her restoration. So far, Europe says nothing for herself as a whole. There is no inclusive European sentiment or thought or sympathy. Europe is one name given to a dozen irreconcilable things. Europe has not been fused by war, nor by the sufferings of the peace. Europe is yet to be born. Then she can be helped.

And, our International Bankers, hearing Europe's cry for "Money!" prick up their ears and say, "Yes, that's it—Money! Money! Money! Fabulous national loans and large percentages of interest, running as a mortgage on endless generations. Money!"

Then follow political whisperings and pullings and haulings, and presently we hear of a "conference" being called (that most popular way of deceiving the people just now) and the International Bankers have put over their plan! Is Europe any the better off? No, but the whole world is much the poorer off.

The most amazing thing about Europe is that she has not learned anything in the last half century. Some day, observing men will mark the time when Europe ceased to be the teacher of the world, and began to sink into that pride-sick condition where she absolutely refused even to learn any more. The attitude of the better classes of Europe today is simply that of a refusal to learn. If they assume the attitude at all, it is usually for the purpose of wheedling us into a better frame of mind with regard to—Money! Europe and her leaders are still trying to re-establish what God Almighty has destroyed for them; they are still butting their heads against the stone walls of destiny; they are still searching for the familiar paths which the recent cataclysm destroyed. Europe is leaderless. What is worse, all her sorrows and sufferings have not melted her into the least semblance of spiritual sympathy or unity.

Naturally, we of America first ask, What can be done? Well, when you look over a wreck you usually know what can be done, but you can see no clue in the European wreck, because it is not a wrecked unit. A wrecked unit can be repaired, but Europe never was a unit in the first place. If your wreckage consists of such a jumble as a wrecked car, a wrecked business, a wrecked character, a wrecked jar of jam, a wrecked temper and a wrecked confidence in things—how are you going to put that wreckage together again? It can't be done. It is not an accident to be repaired, it is just something that has come to an end, that is all—simply come to an end! There is nothing to do, except the elementary things, the fundamental things on which life, mere human life, is founded.

What is still necessary to enable Europe to find herself, no one can say, not even those who talk most about it. There never was so much counsel without wisdom, as there now is. There are, of course, plenty of plans. There are always plenty of plans. Few men could not plan out the whole business if everybody concerned would agree to follow the plan. The big task is to provide a plan in which everyone concerned will see his own advantage, and which everyone concerned will agree to follow. This has not been done. It will not be done. The time has not yet come for it. Europe apparently has still more experience to undergo until she becomes willing to learn a few of the elementary things.

The utmost that can be done now is to make use of the power of necessity. The first necessity is to produce the raw material of life, to plant, to manufacture, to transport. The first necessity, to express it another way, is to get a job. And this necessity has been pointing the way to leaders for a long time: their duty is to make jobs. Poor, helpless leaders that they are, the moment they think of making jobs, they look toward the money-brokers—the cursed obsession of Money again! They look at exchange, and loans, and notes and all the other belongings of ordinary business. But it is really a matter of potatoes and wheat and leather and cheese and flax and spinning and baking and other services. These are all present and involve no money at all—if there were only leadership.

But that "if" intervenes, and it cannot be changed. It is probably up to Americans to make jobs for Europeans, to show them what to do and set them to work. It is true that we in the United States have lately put ourselves down upon the European level of mind by erecting a high tariff wall—but doing the very thing that hinders trade and makes it hard on both sides of the tariff wall—but even in spite of the folly of our own government (and we are just as destitute of real leaders as is Europe) it is our privilege to give Europe work if we want to.

That much is true in the noise of the propagandists: America may have a big hand in saving Europe; but not in the way the propagandists imagine—Money! Not money, but Work. Money is responsible for what flame remains in Europe today. Money explains the Greek and Turkish troubles. If Europe were utterly and finally financially bankrupt, she would be in better condition, so far as looking forward to future unity of effort is concerned, than she is now. While now she has not much money at hand, she is still under the delusion that Money will save her. No. Money did not create Europe. But Money did destroy her. And now, if she is to be recreated, it must be by that which created her first, not Money but a common high purpose and work.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Crossing the Rockies in the Locomotive Cab

Thrill-Charged Scenes of Mountains Look Different From Front End

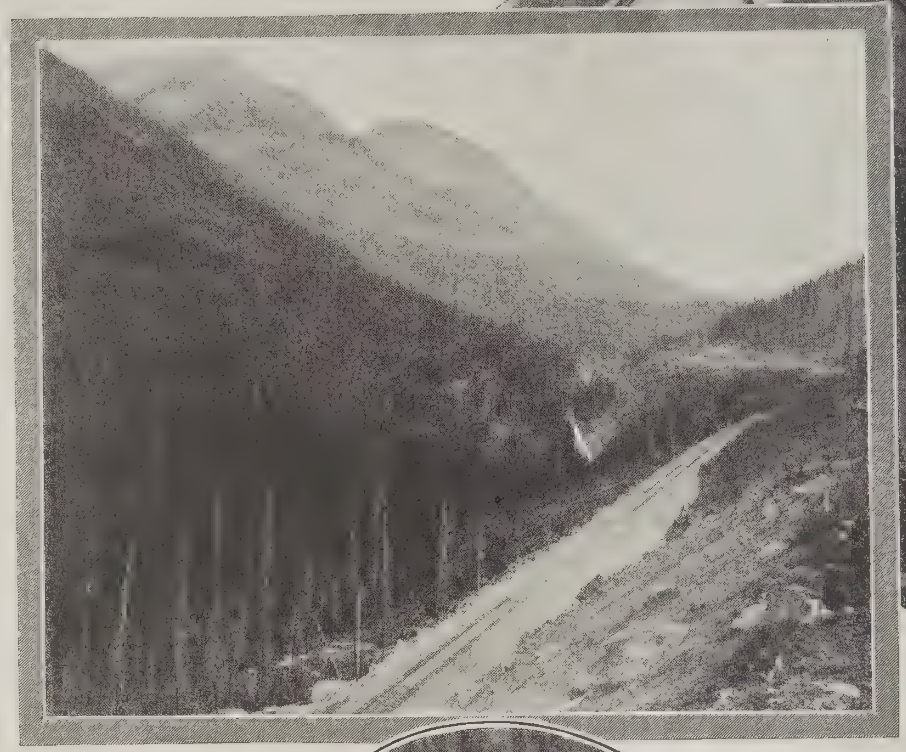
By A. R. PINCI

ACCOMPANIED by mighty sternutations of smoke, steam that had coursed through the elaborate veinwork of the locomotive began to move the heavy transcontinental train westward. The bell ceased jangling, nodding to and fro silently on its pivots as though in recognition of its inadequacy in the midst of a confusion of noises. Snorts and wheezes, at first disconnected and discordant, attuned themselves as forward motion became accelerated, and presently subsided into an opaque echo of new but decipherable sounds—that of metal on metal, metal against metal.

And then began our dance—that of the fireman and myself, each pivoting on either or both feet, as a lateral swaying forced us out of equilibrium. The engineer, resting easily on his perch, a hand skillfully caressing the air-brake lever, watched ahead—a blur in the foreground, because the day was cloudy and mists hung low, fringing mountain tops and pines emerging amid their loftiness, the track visible in sections as we twined our way along a serpentine maze, skirting here a tiny torrential stream, crossing there a barren rocky bed, but always contesting a difficult grade, first upward and then downward.

A sheer drop of 1,900 feet in 12 miles, through baby canyons, above high valleys, through spiral tunnels—two of them—at one time a panoramic vista of many miles beneath us, for either of us could have stepped into eternity during any of those 55 miles of arduous piloting. That WAS a sensation that I felt as I rode on the engine, but that I missed when I made the trip safely and comfortably ensconced on the rear platform of the observation car.

For this is what I wanted to know—what of the road ahead, as it met the eye, instead of the road behind, as it disappeared from sight? There is always a difference between meeting a thing and leaving that thing behind, and I wanted to see what the engineer saw—that which the most timid passenger, even, fails to think about while gazing upon scenes of panoramic grandeur that have been rendered safe by man's engineering skill.

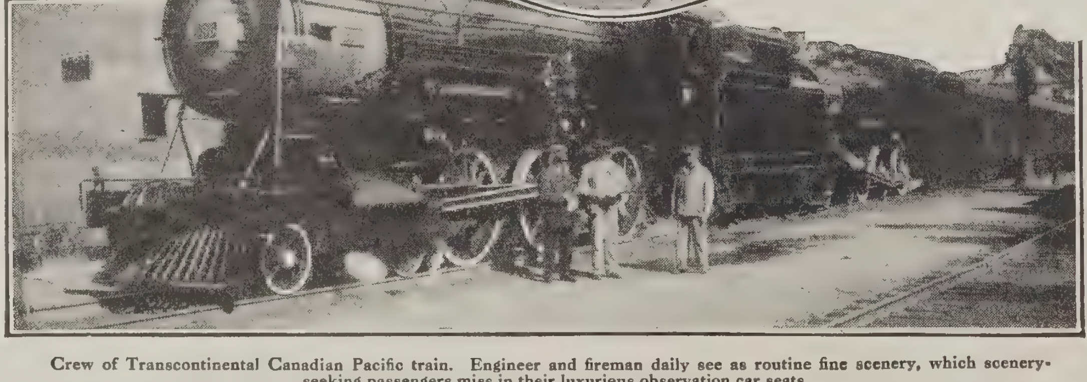


The Prince of Wales with the engineer on the locomotive pilot. At the left—Yoho Valley, through which the ride was made. Circle—A party viewing the mountain scenery from the rear of the train.

There was no time or thought for scenery forward. It was the same view that travelers 300 or 400 feet behind us would soon gaze upon; the same towering peaks, the unkempt hanging gardens, the same streams, the same bridges, the same crumbling cuts, but we approached with care, that which passengers soon after greeted with enthusiastic carelessness.

It was not, this, my first experience of the sort, because several years ago I made the run on a crack Pennsylvania train, between Washington and New York, in the locomotive, but 228 miles in five hours could be hardly comparable to the quartered distance between Banff and Field—the one in Alberta and the other in British Columbia, in half the time. One was a gondola run; the other a ride on a camel suffering from indigestion. I am speaking of the psychological effect, because engines and bed differed little in riding comfort—or discomfort. If I slipped from my Pennsylvania locomotive I would have been hurled on tableland, but if ever I slipped from my Canadian Pacific 564 I would have dropped—just plainly and simply dropped. The distance to bottom might have varied—but it was distance.

Of course, the officials of the Canadian Pacific Railroad did not favor my request for this ride. It was all very well a few years ago "when trains plodded along a few miles an hour," but at higher speed—well, the risk was too great and they would not consider it. Of course, I had assured them of my willingness to sign away their responsibility.



Crew of Transcontinental Canadian Pacific train. Engineer and fireman daily see as routine fine scenery, which scenery-seeking passengers miss in their luxurious observation car seats.

Permission was finally granted. The station master at Banff gave me a paper to sign. The dream of childhood abides in grown-up days, and not one of the fellow passengers who knew about my reportorial task, either before or after, but did not wish to "try it sometime." Parenthetically, I might say that a "train of locomotives" might save the day, but an important official said that it wouldn't do—because every mother's son of them would want to ride in the "front locomotive." So to please all and satisfy none—unless the rare exception is worth considering—they let it be known that it is too risky or some such thing.

But the fact is that neither engineer nor fireman likes to have anybody around while the regular train is in motion—not within their three-by-six empire. The Pennsylvania train crew was quite frigid toward me—so much so, that I thought it quite a miracle the water could boil at all. And was the Canadian Pacific crew any colder? Just a little. The rest of the chill I'll blame on the glaciers and snow-topped mountains about us.

If the officials did not welcome my proposal, I confess that it was nothing in comparison to the engineer and the fireman, each of whom read and reread the formal and official authorization to "hang around," furtively looked at me, looked me over, and wondered.

On board it was up to me. They offered no encouragement. I stood upon the laminated steel floor that bridges tender and locomotive itself, where, despite my poor terpsichorean skill, I was obliged to try steps and humps that must have been quite funny, only I couldn't see them. I was looking at something, but I knew that if I kept looking at the fireman as he fed coal into the furnace I would have been little better off than if I had called upon my New York apartment-house janitor. I tried to make myself inconspicuous. When you are not wanted, those present don't mind letting you know it, and as I reached out a hand—well, I was beginning this time to believe that the advice of "Don't do it" was safe and sane.

For I happened to rest two fingers—fortunately not more than two—upon the six-foot poker which only a few moments before had been flirting with the sizzling coals, and I realized quite painfully that interrupting any flirtation is dangerous business, especially when it is so logical as that of poker and fire. I could not stand upright anywhere; first, because there was no place to stand, and second, because I didn't care to dance anyway. Besides, we had covered five or six miles by now—I could tell because Castle Mountain was becoming more castellated—and if I wanted something to write about I'd better find myself a perch.

If at any time locomotive-riding will be made a popular outdoor sport let us hope that the powers that be will provide suitable perches, at least provide one. For there was not even one. Moreover, I did not like the frequent hot blasts emanating from the grate as the bisected gravity doors swung apart in response to the fireman's left foot on an operating lever. I had to think quickly, too, because the latter presently began to water the coal dust, the dampened boards steaming unpleasantly. This time I put out my right hand—and, of course, I got it nicely wetted, for the water-tank had rid itself of its overfullness. I tried a lateral hand-bar, and this time it was nicely smeared with soot—or "sot," if I am to believe a friendly Canadian. But anyway it was oily black—and so was my hand.

So far, instead of seeing anything ahead I was seeing things about myself, and that was defeating my purpose. I could not displace the engineer, to see what he saw, because unfortunately for me he was needed and the travelers in the cars behind me might have objected to his removal. The eye of the fireman quite succeeded in convincing me that his seat was no place for me—that he needed it to rest his tired back—though the handicap was against him in this rest business.

The ice wagon simile is apt. One foot on the wet and worn step, a hand grasping the scale-chain, and the rest of the body devoted to ways and means—ways to jump from the lash's reach and means of getting the sliver of ice for parched throat. Thus the inner and ancient child solved the outer and modern man's problem. My rejuvenated eye singled out a nice (except for the dust and soot), iron bar, very solid, if I could judge of rivets, and having thus found a place for my hands I looked for a foothold. There was no such thing. The best thing offered was a wooden platform just about fitting a pair of No. 7 feet, but I admit that they crowded the step. It wasn't uncomfortable for the step but it was uncomfortable for said feet. One is all I could spare, and as levitation of this sort was anything but natural—and we had yet 47

Trying a Case in the Newspapers

The Third Phase in the Death of Major Alexander P. Cronkhite and Indictment of Captain Robert Rosenbluth as the Murderer

By CHARLES ALBERT COLLMAN

THE question to the forefront in this case is not whether Rolland R. Pothier, or Robert Rosenbluth, both under indictment by a Federal Grand Jury in Tacoma, Washington, as responsible for the death of Major Alexander P. Cronkhite, is guilty or innocent. That is for judge and jury to decide. They are presumed to be innocent until pronounced guilty. It is doubtful whether there is a man, woman or child that desires the conviction of these men. On the contrary, the country would experience relief on witnessing their acquittal of the grave charge that rests against them. If pronounced innocent, undoubtedly they would be cheered as they left the court room. For that is the spirit of the American public.

No, the question at issue is whether one race, through a series of highly organized attacks upon a wide number of public officials, by fanning an unfounded hatred among an emotional people, and attempting to blind the public in a press campaign conducted on a grand scale and with unlimited expense, in newspapers, periodicals and pamphlets, can overturn the laws of a constituted government, nullifying its legal procedure in criminal cases.

The known facts are as follows: During the progress of the Great War—or to be more exact, on an October morning in 1918—a battalion of the 213th Engineers was led out on a hike through the United States Army Reservation at Camp Lewis, Washington, to study advance guard problems. Captain Robert Rosenbluth, a man of about 40 years, who had been trained at Plattsburg, New York, was conducting the maneuvers, under the direction of Major Cronkhite, 24 years old, who had been graduated from West Point three years before. It was the duty of the young major to give the problems and criticize their execution.
